In the following table the production has been separated into two groups—that of desilverized lead obtained from smelting argentiferous ores drawn from the Rocky mountain region and that of "soft" lead produced from non-argentiferous ores of the Mississippi valley. The latter also includes small quantities obtained from Virginia and Tennessee. In 1896 the treatment of foreign ores in American smelting works began to assume importance, and it became necessary to make allowance for the quantities involved, in order to arrive at the actual lead product of the United States. Later the refining in bond of foreign base bullion became an important industry. Varying quantities of the metal so produced are retained for home consumption, so that it became necessary to make special inquiries dealing with this feature. The growing complications make it impossible to arrive at an exact statement of the lead obtained from domestic sources, so that only a close estimate is possible. In 1894, after a careful consideration of the methods possible, the system was adopted of appealing to the smelters for a statement showing the source territorially of the lead contents of the ore worked by them. This was regarded as the most satisfactory and direct means, not alone for reaching a sound basis for an estimate of the actual lead product of the United States, but also, at the same time, afforded an opportunity for reaching precise data relative to the contribution and the total of the different States and Territories. The result of the investigations thus made is embodied in the following table:

PRODUCTION OF REFINED LEAD IN THE UNITED STATES FROM 1893 TO 1896, BOTH INCLUSIVE.

YEAR.	*Total Production. (a) Short tons.*	*Desilverized lead. (a) Short tons.*	*Soft lead (b) Short tons.*	*From Foreign ores and base bullion. Short tons.*	*Net American Product. Short tons.*
1893	*d*220,333	106,820	32,513	65,351	168,082
1894	219,090	181,404	37,686	59,730	*e*162,686
1895	241 882	201,092	39,890	76,173	*e*170,000
1896	264,994	221,557	43.537	57,612	*e*188,000

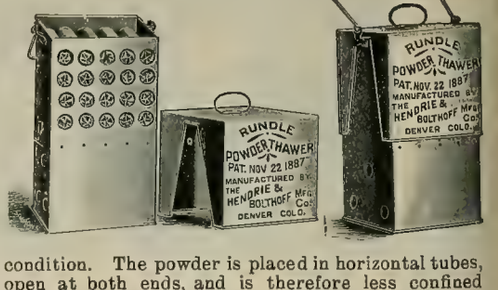
(*a*) Including foreign base bullion refined in bond.
(*b*) Including a small quantity of lead produced in the Southern States.
(*d*) Including 5013 tons of antimonial lead.
(*e*) Arrived at from direct returns from smelters.

The product of desilverized lead in 1896 includes 7507 short tons of hard lead.

* Eighteenth Annual Report U. S Geological Survey—Division of Mineral Resources—David D. Day, Chief of Division.

New Powder Thawer.

The accompanying cuts represent the Rundle powder thawer, the invention of A. J. Rundle of Iron Mountain, Michigan, and manufactured by the Hendrie & Bolthoff Manufacturing Company of Denver, Colo. The thawer is constructed of galvanized iron and keeps the powder in good working



condition. The powder is placed in horizontal tubes, open at both ends, and is therefore less confined than in most other thawers. The tubes are entirely surrounded by water, and the sticks of powder lying on their sides are not subject to the danger of melting and running into a mass, as is often the case when standing on end.

Have Been Disbarred.

John Wedderburn and John Wedderburn & Co. have been disbarred from practice before the United States patent office. The recommendations that they be disbarred were signed to-day by the Commissioner and Assistant Commissioner of Patents and approved by the Secretary of the Interior. The commissioner and assistant commissioner did not mince words in condemning the manner in which the disbarred attorneys conducted their business.—Washington, D. C., Post, October 1.

One Month's New Subscribers.

In last Saturday's issue it was stated that during the month of September, '97, there were received at this office 179 new subscriptions, mostly from Colorado and California, merely illustrating the growth in the circulation of this journal. Some doubt, however, having been expressed in one quarter as to the exactness of that statement, it has been deemed advisable to publish the names and addresses of the new subscribers received in this office for this journal during the twenty-six working days of September last, as follows:

Alaska.

W. K. O'Brien, Juneau.

Arizona.

W. H. Smith, Tempe.
J. A. Newman, Signal.
Jno. Odell, Columbia.

California.

Otto Kattenborn, Shasta.
W. A. Barnes, Fullerton.
E. A. Gilbert, cr. University of Cal., Berkeley.
Cal. Exploration Co., No. 229 Cal. St., S. F.
Phœnix M. & I. Co., Nevada City.
H. A. Stenger, Nevada City.
Samuel Drake, Grass Valley.
J. L. Glynas, Grass Valley.
John Regan, Grass Valley.
J. D. Purcell, Grass Valley.
T. J Murry, Granite Station, via Bakersfield.
S. G. Tenney, Graniteville.
L. E. Peck, Graniteville.
Richard White, Grass Valley.
Al. Hall, Grass Valley.
A. E. Williams, Grass Valley.
F. Maurer, Grass Valley.
J. T. Hooper, Grass Valley.
C. F. Maloney, Box 388, Grass Valley.
D. Aitken, cr. Empire mine, Grass Valley.
Henry Watson, Box 413, Grass Valley.

Any one who has the slightest doubt as to the truth of the statement referred to is cordially urged to write to any one of the above names and ask if the statement, so far as he is concerned, is true. It is believed that no better proof can be given of the precise veracity of the little item in the issue of October 2nd than is here offered. In this regard it may be said that the policy of this paper has been to let advertisers alone and to direct money and ability to increasing the value of the paper and its circulation. So far as advertising is concerned, it may be said that an advertisement of mining machinery or anything else likely to be wanted by the men who read this paper is of value to the advertiser in exact proportion to its paid circulation. In some cases a paper is apparently published only for private distribution; and while the advertiser and a few of his business competitors may see it, it is doubtful whether any possible or probable customers will. This is believed to emphasize the chief value of this paper as an advertising medium

Without resorting to any of the usual newspaper schemes to induce and acquire large circulation lists, but solely on its merits, this paper has honestly secured what is believed to be the largest circulation of any paper of its kind in the country. It is not thrust upon anyone, but the fact that thousands upon thousands of men in all departments of mining industry in this country want it, and pay for it, is pretty good evidence of its value to them.

It will be observed that the statement in the issue of the 2nd inst. was that 179 new subscribers had been secured in September, chiefly in Colorado and California. Anyone taking the trouble to count the names in the above list will find that the statement was under rather than in exaggeration of the exact fact. The above list is published, not as indicative of any great abnormal growth during September any more than any other thirty days; but month by month the subscription lists show a substantial increase; nor is it desired that there be any parade made of this matter, but it is believed that where a thing is said it should be proved. It will be noted that the above list contains 183 new subscriptions received at this office during the twenty-six working days of September, '97, and is merely cited as a part of the reports of this office handed to the writer for inspection during that time. It is to be understood that the above are *new* subscribers, and there is no connection nor reference to the regular large list of renewals. These 183 new subscribers, it will be understood, constitute but a very small segment of a very large circle. It would require a special edition to print the names and addresses of our thousands of subscribers. It is fair to assume, also, that every subscriber means four readers.

It is further believed that this matter illustrates the fact that the MINING AND SCIENTIFIC PRESS is not a local publication, but covers a very large field in this west half of America. It shows that the attention of mining men everywhere is directed to San Francisco as a mining center, and is thus believed to be of direct benefit to this city. It is also illustrative of the great increase in the mining activity of the country. From time to time has been noticed in these columns the increase in the number of new mining journals. Those contemporaries will not take it unkindly when the belief is courteously recorded that the MINING AND SCIENTIFIC PRESS has in this field as many paid subscribers as all of them put together.

The "American Newspaper Directory," official authority on this subject, publishes the following unsolicited statements:

> Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.
>
> In all the States of the far West and the Pacific slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded the MINING AND SCIENTIFIC PRESS, and the publishers of the "American Newspaper Directory" will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully assails it.

As it was a prospective advertiser who expressed some doubt as to the accuracy of the statement made last week, it is probably in order to observe that, while it is neither the province nor policy of this paper to coax, beg or tease business men to advertise in its columns, yet it is respectfully submitted that any live business man will realize that a paper read by so many thousand probable customers everywhere is undoubtedly the best medium in which he can best advertise what he has to sell. As in other things, a good deal of good money is fooled away in advertising, usually in journals that have no circulation and are therefore of no value, whose editorial utterances are controlled entirely by its patrons, and who usually have but "one rate" for space, namely, that which is offered by the advertiser.

In connection with this entire subject of the large circulation of the MINING AND SCIENTIFIC PRESS occurs one more fact, namely, the unusual ability of this paper to hold its old subscribers. It is but the simple statement of a business fact that the discontinuance of a subscription to this paper—except from the ordinary fluctuations of life and death—is so rare an occurrence as to be remarkable.

It may appear in bad taste to devote so much space to these matters; but everything herein stated regarding large circulation has been often kindly and widely commented upon in a most complimentary way by so very many of our contemporaries that the writer may be pardoned for directing attention to a fact that has been so often and so pleasantly referred to by others.

Do You Know THAT THE

MINING AND SCIENTIFIC PRESS

HAS THE LARGEST CIRCULATION OF ANY PAPER OF THE KIND IN THE COUNTRY? : : :

. . THAT IT IS THE ONLY PAPER OF ITS CLASS . .

THAT GIVES THE EXACT FIGURES OF ITS CIRCULATION?

—♦—

It is Weekly Read by More Than 25,000 Men in Every Department of Mining and Mechanical Industry.

—♦—

IF you want your business advertisement seen by the *MEN TO WHOM YOU NATURALLY LOOK FOR BUSINESS* put it in the

MINING AND SCIENTIFIC PRESS.

ESTABLISHED MAY, 1860.

—♦—

A paper that has led in its line for over thirty-seven years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which give no results.

It is not what Advertising Costs, but what it Produces, that Determines its Value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Success or failure depends upon profitable advertising. Our patrons find an investment in our columns a profitable one.

Electrical Progress.

Electric Metering from the Station Standpoint.*

NUMBER II.

By CARYL D. HASKINS.

The methods which are commonly practiced in tampering with meters can scarcely form any proper part of a technical paper; but as this paper may go into the hands of some who need the knowledge to guard themselves and their interests, it can do no harm to briefly state the common methods used, not only that they may be guarded against, but also that meters may be selected which lend themselves least readily to such practices. It is not unusual to place large masses of iron above, below or at the side of meters, but this practice is falling somewhat into disrepute among its advocates, since even they have in time discovered that there is a class of meter which it accelerates.

Electro-magnets, drawing their energy from the circuits under measurement and used as the iron was formerly used, are now not uncommon, and it is difficult to prove deliberate evil intent.

Meter covers and cases are drilled, and wires, broom straws and the like inserted. Covers are "pried" up and healthy colonies of spiders introduced.

Ingenious individuals have even been reported as finding profit in a clever apparatus for injecting fine iron filings into meters by means of a bellows.

All of these things need to be watched for and guarded against.

The question of installation and care of meters is a wide subject, and in connection with it I shall endeavor to mention only a few salient points, selecting those which are most commonly overlooked or neglected.

The most radical cause of trouble in connection with installation is vibration and the consequent reciprocating motion of the shaft. For this reason the most solid of foundations should be selected, the neighborhood of moving machinery should be avoided, as should also partitions of light construction in which doors are located. The rhythmic vibration of moving machinery is infinitely more dangerous than occasional heavy shocks.

Meters should be installed as near to the foundation as possible, not, as is now quite common, at the top of buildings, where the amplitude of all vibrations is, of course, much greater.

Locations where great variations of temperature occur are undesirable. For this reason, also, basements are preferable to attics.

A very common error, causing the loss of very many meters annually by the burning out of the potential circuits, occurs in connection with the metering of power delivered to motors. In the effort to save the very trivial amount of energy passing through a potential circuit it is very common to install meters on the motor side of the controlling switch. This not only exposes the meter to the full force of the field discharge, but it also results in the constant cooling and heating of the potential winding, and the resultant expansion and contraction chafes and weakens the insulation and also weakens the wire itself at the turns, opening the path for a final breakdown either by a lightning discharge or by a field discharge.

As to the care of meters, it is a fallacy to suppose, as many insist upon doing to-day, that meters should require no care whatever. Almost all meters will continue operative for a very long period without any care whatever; but the cost of a cleaning and testing visit twice annually is trivial as compared with the good results which follow such a system by reason of the better light-load accuracy obtained. It is not, I think, too strong a statement to say that such a system will have an influence for good, amounting to from 3 to 5 per cent on the meter readings annually.

Central station managements have probably given more attention to systematic methods of meter reading than to any other one point contributing to success. The old and faulty plan of reading the dials of a meter at the time of the visit to the meter is fast giving place to the better system, which provides the reader with a facsimile of the meter dial in blank upon a page of his meter book. This facsimile is roughly marked in pencil to indicate the position of the hand at the time of the visit. These facsimiles are taken into the office and are all read by one individual who is an expert in meter reading, who sets down the consumption under the facsimile on each page. Such a system commonly reduces the errors from about 10 per cent per month, where they not uncommonly stood under the old system, to materially less than 1 per cent under the new; for, surprising as it may seem, it is an extremely easy thing to make mistakes in reading meter dials.

In changing from the old and not infrequently popular contract system, a good many central stations in the earlier days made the grave blunder of going on to the new basis during the winter months, with the result that the highest bills of the year reached the customer after a long period of indulgence under the contract system, and the result at times proved temporarily disastrous.

Even to-day the pernicious influence of uniform bills the year through, which was created by the contract system, still lingers; and the proportion of customers who complain because their winter bills are materially higher than their autumn and summer bills is quite considerable.

It will be said that the explanation is sufficiently simple; but, unfortunately, however good and however simple the explanation, it has proved no simple matter to secure its acceptance and credence. I have lately been much impressed by a system which has recently been adopted by a prominent Western company to at least partially offset this difficulty. During the months which are growing darker they read their meters a day or two earlier each month, thus arbitrarily creating shorter months, whilst as the year progresses to the period of lighter days the months are lengthened. This somewhat tends to even up the bill, is apparently quite as satisfactory to the customer, and is certainly entirely just and has created a very great falling off in the complaint list, for the character of the complaint keeps pace with the period of the year. Out of the hundreds of complaints which I receive annually, I find that by far the greater proportion in the summer are of slow meters and in the winter of fast meters.

(*To be Continued.*)

*Read at the Fourteenth General Meeting of the American Institute of Electrical Engineers, Eliot, Me., July 27, 1897.

Smelting by Electricity.

D. Tommasi, in a paper published in the July number of *Moniteur Scientifique*, describes a new process of electricity for separating and refining metals, of which the following is a brief abstract:

"The anodes are either cast plates or granulated material, resting in direct contact with the positive leads. The cathode is a vertical disc, capable of rotation about its horizontal axis. Only the lower portion is immersed in the electrolyte, and the upper part is passed during rotation between scrapers that effect the removal of any spongy deposit, transferring it to channels by which it is conveyed to a convenient receptacle. The disc is constructed in replaceable sections, when a reguline deposit is to be obtained, and the sections are one by one removed mechanically as they attain sufficient thickness, and are plunged beneath a fluid bath of the metal under treatment until the deposit has been melted away and the sector is ready for use again. A solid disc is preferred for spongy deposits. The advantages of this arrangement are that polarization is prevented by the rotation of the cathode and by the action of the scrapers, and the liquid is sufficiently agitated to prevent separation into layers of different density, while the spongy deposits are removed as fast as they are produced, thus preventing oxidation by the liquid and the occurrence of local action. At the same time the electrodes may be allowed to approach more closely, owing to the impossibility of short circuiting through irregularity of deposit, and the resistance of the bath is therefore sensibly diminished."

Care of Dynamos.

From recent remarks by J. E. Bates before Los Angeles Association, N. A. S. E., on the above subject, is taken the following extracts:

Examine the entire machines thoroughly to make sure that there are no screws or connections loose or out of place. See that the machine has sufficient oil. In case of self-oiling bearings see that the rings work freely. See that the belt has the proper tension. The machine may now be started slowly and the brushes lowered to make contact with the commutator, the main switch being left open. The brushes being set properly the machine may now be gradually brought up to full speed—watching closely in the meanwhile that no faults develop. Always be ready to shut down instantly in case everything is not right. It has been customary, in some cases, to bring the generator up to full speed before lowering the brushes into contact with the commutator, but there is no reason for this other than that the engine might turn the machine against its brushes—due either to ignorance or carelessness in starting. The advantage in lowering brushes while running slow is that voltage comes up slowly and that any fault or difficulty will develop slowly and the machine can be stopped before any great injury can be done. In fact, if the machine is working alone on a system and if free from short-circuiting any other machine or storage battery in the same circuit, it may be started up with main switch closed, in which case the E. M. F. and current feel their way, so to speak, through the whole system, and any trouble manifests itself so slowly that it can be taken care of before serious injury results. If, however, a generator is to be connected to another, or to a circuit having other generators working upon it, the greatest care should be taken. Get the machine up to speed and everything going properly, voltage of machines equal; close main switch, shift brushes to neutral point of the sparking and again equalize voltage. There are various ways of coupling dynamos, but the subject is necessarily too long to treat here. After the machine is started and carrying her proper load it requires very little attention while running. Of course, if a machine has been standing idle for a long time, is a new machine, and changes have been made, or weak points suspected, it would be advisable, we might better say, necessary, to watch it closely for awhile.

It is always well to give bearings of a new machine plenty of oil at first. A new machine should be run without load—or at least a very light one for an hour or so, as it is objectionable to start a new machine with its full load—or in other words, its safe carrying capacity in amperes. If possible the machine should be shut down when any trouble, or indication of trouble, appears so as to avoid injury and give time to look up faults. Keep all tools or pieces of iron or steel away from the machine while running, as they might be drawn in by the magnetism and perhaps get in between the armature and pole pieces and ruin the machine; for this reason use brass or zinc oil cans around a generator. Never lift a brush while machine is running, as it might make a bad burned spot on the commutator, unless one or more brushes are on the same side to carry the current. Touch the bearings and field coils occasionally with the back of the hand to see if they are getting hot. To tell if the armature is running hot, place the hand in the current of air thrown out from armature. Do not handle or touch any connections, switches, binding posts, bare wires or bare metals in circuit, unnecessarily. Never use waste on commutator; always use chamois skin or a piece of clean cloth. Extreme precaution must be taken for pressures of 500 volts or over. In stopping a dynamo use the same general precautions as at starting; in addition examine machine to see if it is dangerously warm. If the armature or field coils are too warm to bear the palm of hand continuously, they may be considered to have passed the safe limit.

In handling generators there are faults liable to arise, such as sparking at brushes, heating of armature, heating of fields, heating of bearings, noise, speed too high or too low or dynamo fails to generate. We will begin at the most common fault—sparking at brushes. The most fruitful cause of this trouble is poor design, although at present electrical machinery in general is so well designed that this point could hardly be considered, except in some of the older types of machines. Some of the latter will spark more or less. If the sparking of these has been reduced to the minimum, our engineer has fulfilled his part perfectly, or as well as lies in his power. If armature carries too much current or load, brushes not at neutral point, commutator is rough, out of true, has a high bar, a flat or low bar, brushes make poor contact, a short circuited coil, a broken circuit, or weak fields, either will cause more or less sparking.

Heating in armature is caused by excessive current in armature coils, short circuited armature coils, moisture or Foucault or eddy currents in coils. Heating of the field magnets is caused by excessive current in field circuit, Foucault currents in pole pieces or moisture in field coils. Heating of bearing is caused by lack of oil, grit or other foreign substances in bearings, shaft rough or cut, shaft and bearing fit too tight, shaft sprung or bent, bearings out of line, thrust or pressure of pulley, collar or shoulder on shaft against one or both bearings, too great a load or strain on belt, armature too near one pole piece, producing much greater magnetic attraction on one side than the other, a short circuit across commutator, or bearings too close together, leaving no end play for armature.

Noise is caused by vibration due to armature core being out of balance, vibration due to armature striking pole pieces, pulley being out of balance, shaft shoulders or collars rattling against bearings, rattling due to loose parts, as screws, etc., flapping of belt, pounding of laced belt joint as it passes over pulley, slipping of belt on pulley, due to looseness of overload or humming of armature core teeth, if any, as they pass pole pieces, speed too low when belt slips, machine overloaded, a short circuit in armature, armature striking pieces, or shaft sticks in bearings.

Sometimes the speed is too high, as when load is suddenly thrown off, a fuse blows, or the field magnetism is weak. These speed changes will not take place if the engine or other driving power has a governor sufficiently sensitive to keep speed constant under the variations of load. A dynamo will not generate when there is a short circuit in machine or external circuit; *i. e.*, if external circuit is connected to machine at time of starting. When field coils are opposed to each other, an open circuit, due to broken connection, brushes dirty, safety fuse gone, or absence of residual magnetism in fields. A shunt machine will not pick up (as a general thing) until up to or nearly up to speed, whereas a series machine will pick up in the majority of cases as soon as or nearly as soon as armature begins to revolve. In some rare cases a shunt machine may be a long time, even an hour or more, in building up, due either to dirty brushes or sluggish fields, or both.

In conclusion, let me say that the one thing above all others we must bear in mind is to "keep her clean," both as to looks and working parts, as where we have dirt, trouble and failure on the one hand, we have cleanliness and success on the other.

Scientific Progress.

A Bunsen Burner for Acetylene.

An interesting item regarding the use of acetylene as a heating agent occurs in the *Chemical News*. A. E. Munby writes: "The cheap production of calcium carbide has placed a powerful illuminant within the reach of those who possess no gas supply, but so far little has been heard of the use of acetylene as a heating agent. Our laboratory is, so far as we know, the first to make use of the gas for this purpose. We employ a Bunsen burner of special dimensions, the tube being five millimeters in internal diameter. A slightly wider tube may be used, provided the mouth be curved inward, so that the actual exit does not exceed the diameter mentioned; if larger, the flame tends to strike down. The gas jet is very small, being only capable of delivering about one cubic foot of acetylene per hour under 6 inches water pressure, such a rate of consumption giving an ordinary working flame. The air holes and collar are arranged as in an ordinary Bunsen, the exact size of the former not being of much importance, provided they be large enough to admit the air required. A generator capable of giving gas under 7 inches water pressure, with the full number of burners in use, is required. The heating effect of the flame is, of course, very great, enabling one to dispense with the blowpipe for some operations, such as small fusions. * * * It would seem that in practice, for equal volumes burned, the acetylene has nearly twice the heating power of coal gas."

Scenery of Spitzbergen.

Sir William M. Conway and his companions found Spitzbergen, of which they were the first explorers, a very different country from what it was supposed to be. The general impression was that a continuous ice cap would be found, and they expected it; but "in place of a frozen surface they met with crevassed, sloppy glaciers, surrounded by miles of quaking bogs and innumerable watercourses"—a perpetual thaw produced by the perpetual day of a brief arctic summer, in a region emerging, as it were, from a glacial epoch. Of course the opposite conditions of relentless ice prevail in winter. Why should men be attracted to such countries, as Arctic explorers who have gone once seem to be time and again? Sir William gives one of the reasons. "The Arctic glory," he says, "is a thing apart, wider, rarer, and no less superb than the glory of any other region of this beautiful world. Here man has no place, and there is no sign of his handiwork. Nature completes her own intentions unhelped and unhindered by him. Such pure snows no Alpine height presents, nor such pale blue skies, nor that marvelous, remote, opalescent sea with its white flocks and yet more distant shores. No Alpine outlook penetrates through such atmosphere, so mellow, so rich."

Interest in Antarctic Regions.

The Royal Geographical Society in London has determined to take upon itself the responsibility of organizing a private expedition to the Antarctic regions. The British Admiralty has promised to assist such an expedition by the loan of instruments and by advice, and it is probable that, although unable to undertake the whole responsibility, the Government will greatly aid what would undoubtedly be a national enterprise. The uttermost parts of the earth have never been so sought out as at present, and the Antarctic is now attracting attention as well as the Arctic. A Belgian expedition sailed on July 25th for the Antarctic region. All that is known of the Antarctic at the present time is that nobody has got nearer to the South Pole than 720 miles. Icy barriers exist which eclipse those of the North Pole; mountains have been discovered of lofty altitudes, and some of them are volcanoes. The land is covered with snow at all times of the year, and no human being has been met south of fifty-six degrees; no land quadruped is known to exist beyond sixty-eight degrees, and no vegetation of any account has been seen beyond fifty-eight degrees. Andree and Peary are searching for the North Pole, and it is hoped that through the explorations in the Antarctic regions more will ultimately be known of the South Pole.

Mechanical Progress.

Forced Lubrication of Engines.

For all kinds of engines forced lubrication gives the same advantages; namely, automatic lubrication, noiselessness, economy and freedom from wear. This last is due to the working surfaces being kept apart by the film of oil forced between them. Although the pressure per square inch on the bearing itself is far in excess of the oil pressure used, yet the relaxation of pressure on the return stroke in a double-acting engine permits the oil at these times to be driven between the metal surfaces, and during the fraction of a second occupied by the acting stroke the film of oil cannot be squeezed out. This might indeed be readily taken for granted, and is clearly proved by the absence of wear in a large number of engines built. It is obvious that the oil is in the best position to take advantage of the momentary relaxation of pressure between the surfaces, if it is itself under pressure sufficient to push between the brass and the journal, so as to flood the bearing completely. If the oil is supplied by gravity alone, under the head, usually given in double-acting engines, there is not sufficient time for permitting it to penetrate to any distance. In a single-acting engine under constant thrust, no such film is possible. In both the latter cases the journal will, of course, be greased; but if friction and consequent wear of the journal are to be absolutely prevented, such a film of oil as the forced lubrication provides between the journal and brass is essential. The better the body of oil, the less chance will there be of effective lubrication without adequate oil pressure.—Marcom.

The Wear of a Locomotive.

The managers of the New York Central Railroad resorted to an expensive and painstaking method recently to find out what parts of an engine wear out most quickly, and in what ratio the several parts wear out. Their famous engine, No. 870, which, in the opinion of many railroad men, excels even the noted No. 999, was taken into the shops and completely overhauled. It was taken apart, and every piece of the engine, from the ponderous driving-wheels to the smallest bolt and nut, was separately weighed. The greatest care was taken to see that the weighing was accurate. When every part had been weighed skilled mechanics were put to work to reassemble the engine, and when complete it was again put into active service on the road. Some months afterwards it was taken back to the shops and completely dissected again. Once more every part was separately weighed, and the record was compared with the former one. Then the master mechanic knew just how much the engine had lost in weight through the wear of a known amount of work. The records of the weights of the several parts showed which parts were subject to the most wear. In both instances the small parts of the engine were weighed on a pharmacists' scales. When the exact figures have been made known they will doubtless prove interesting.

It is stated in *Machinery* that acetylene is now in use in several of the Paris omnibuses. The generator weighs about twenty-nine pounds, and is carried under the front steps. Each load of carbide is about .71 pounds, and produces about 3 cubic feet of gas, which is enough for six and one-half hours, with a light of sixteen candles.

Coast Industrial Notes.

—The ship John Ena, bound for Port Pirie, carries the largest cargo of lumber that ever went out of Puget sound.

—The Sunset Limited train, heretofore running to San Francisco via New Orleans, will be transferred on October 19th and run via St. Louis and El Paso.

—The Terry lumber plant in Shasta county, Cal., employs 150 men. Seven miles of new railroad have been completed. The plant has a capacity of 60,000 feet a day.

—Within the past two weeks thirty-one separate filings have been made in Arizona announcing notice of intention to construct 3000 miles of railroad in the Territory.

—On the 1st inst., the contractors sent 100 men and teams to Kramer, Cal., to begin work on the railroad to Randsburg. The line will be twenty-eight miles long, and is to be completed Jan. 1st, '98.

—At a recent meeting of the San Diego Yukon Mining Company sixteen young men signed the articles of the company, pledging to give $500 each and join in the co-operative effort to mine along the Yukon.

—Claus Spreckels paid $54,000 to the Custom House of San Francisco this week for duties on machinery for the manufacture of beet sugar, recently imported by him from Europe. The machinery cannot be made here.

—Yamhill county, Or., hop crop is estimated at 400 bales. It is worth, at present quotations, $100,000. The significance of this appears when it is understood that this is the product of less than 600 acres of ground.

—The statement of the earnings of the Northern Pacific for the second week in September are the most remarkable of any road in the United States. The earnings were $529,455, which is an increase of over $100,000 over the amount for a similar period last year.

—H. C. Dillon of Los Angeles, Cal., a director of the Nevada Southern railway, states that the end of the litigation which was brought about by ex-Mayor Carlson of San Diego is about to come, and that the extension of the road from Vanderbilt to Good Springs will be started soon.

—It is the intention of the Robertson Raft Company to build three big rafts next year at Stella, Wash., on the Columbia river. The demand for fir piling from the Columbia river is steadily increasing in San Francisco, which uses annually large amounts on account of the ravages of the teredo, which each year destroys many thousands of piles.

—The Los Angeles *Times* says: The thirty-day suspension of oil production has proved impracticable, and, after ten days of idleness, the pumps must be started to supply the market and fill contracts. What has become of that alleged surplus is something of a mystery. Perhaps it never existed, but was a myth invented for the purpose of keeping the price of oil below the dollar mark.

—An attempt is being made to revive the Yuma canal scheme of boom times, by which water was to be taken from the Colorado river twenty-five miles above Yuma and used to irrigate fifty miles of desert country on this side of the line and 100,000 acers across in in Sonora. The Attorney-General of California some years ago gave an opinion that the waters would not be allowed to be taken out of the United States for irrigation purposes.

—The Flagstaff, Arizona, *Sun-Democrat* says it is estimated that the Santa Fe Pacific Railroad Company will expend in the neighborhood of $500,000 in water storage dams this year in the counties of Yavapai and Coconino. The dam at Seligman is estimated at $185,000, and the ones at Ash Fork and Walnut will reach considerable over $125,000 each. This company is sparing no expense in making the western division of their line second to none.

—The phenomenal demand for lumber has depleted San Francisco yards, and many firms have been obliged to refuse orders, although mills are running full blast. In consequence, the price has advanced from $9 a thousand two months ago to $13 at present. Shingles are in great demand east of the Rocky mountains, the average Eastern shipment being 2000 carloads a month. The price of shingles has recently advanced from $1 a thousand to $1.35, with prospects of a further advance.

—Bids on a municipal water plant and supply for the City and County of San Francisco were opened last Monday at a meeting of the new Board of Supervisors. There were four bidders, who put in estimates ranging from $2,000,000 to $16,000,000. Edward Ewald proposed an artesian supply. The water rights of the El Dorado Water and Deep Gravel Mining Company were offered, a supply from Lake Tahoe was tendered, and the fourth bidder was the company which controls the Castroville lakes, in Monterey county.

Personal.

S. B. Milner has resigned the management of the Geyser-Marion, Utah, mining property.

H. Blauvelt is the new superintendent of the Gladiator M. & M. Co., Yavapai county, Arizona.

Clarence King is examining the Black Warrior and Continental properties, Globe, Arizona.

Leopold Meyer, from Belgium, is the next superintendent of the Drake and Tryon mines, Angels, Cal.

W. G. Dodd, of the Union Iron Works, has returned from a lengthened business sojourn in Montana.

Mr. Jas. W. Abbott, M. E., is now at Grant's Pass, Oregon, which he will make headquarters this winter.

J. D. McGillivray, en route for Dawson City on the C. H. Hamilton, when that steamer was stranded in the Yukon 400 miles below his destination, started in a canoe September 1st, and expected to reach there October 1st.

Major Heuer, U. S. Corps Engineers, is expected to return to San Francisco from Cincinnati about the 15th inst.

Philip Mixsell, the mill man of Idaho Springs, Colo., is in Mercur, Utah, examining the new milling plant at that place.

T. R. Warne, recently from Birmingham, England, is to have charge of the Cuprum Smelting Company's plant, Cuprum, Idaho.

H. A. Keller, who recently completed the Yerrington, Nevada, smelter, is examining copper properties on the Illinois river, Southern Oregon.

Henry Bratnober, representing the London Exploration Company, is back from the Klondike. He left Dawson City August 28th, and in an interview is made to say that "there is enough gold in that region to keep 6000 miners busy for the next three years," which he denies saying.

Jos. Ladue, "the founder of Dawson City," arrived in San Francisco last Thursday. In New York City he organized a mining and development company, and is here to get bids on mining machinery to be sent to the Klondike next spring. He expects a large city to be built on his townsite there, and says the company he represents purposes considerable work next season.

Commercial Paragraphs.

The Parke & Lacy Company, San Francisco, reports the sale of two 150x14 foot Ropp furnaces—one to Robert Lanyon's Sons' Spelter Company of Iola, Kan., the other to the Mountain Copper Company, Limited, of Keswick, Cal., and a hoisting and air compressor plant to Leopold Meyer for the Drake and Tryon property, Angels, Cal.

The Diamond Hills Gold Mining Company, located at Hassel, Montana, has just started up its plant. Embracing, as it does, the most modern practices in hydraulics, electricity and mining, a brief description will be of interest. The water is taken from Crow creek and conveyed a distance of 2¼ miles in a flume; thence it is led through a 42-inch pipe to four Pelton wheels, each 40 inches in diameter. The wheels are directly connected to a 500 K. W. three-phase General Electric generator, the power equipment being mounted on a common base and entirely self-contained. The power is transmitted electrically over 1¾ miles of wire to the mill. The mill consists of 120 stamps with rock breakers, Frue vanners, etc. The power at the mill is divided into several units, there being two motors for the batteries, one for the breakers and one for the concentrators. Thus, each unit is under individual control and the plant is readily handled. The hydraulic equipment, including the governing apparatus, was furnished by the Pelton Water Wheel Company, the electrical apparatus by the General Electric Company and the mining machinery by the Union Iron Works. The entire plant is said to be a model one in every respect and will be heard from as an economical ore producer.

The British Thomson-Houston Company of London, through its representative, A. K. Baylor, has just closed an important contract with the companies operating the tramway systems of Dublin, Ireland, and Barcelona and Madrid, Spain. The contract for Dublin includes all steam as well as the electric generating and motor equipment, and comprises six Allis horizontal engines of 500 H. P. each, six 500-kilowatt multipolar General Electric generators for direct connection to the engines, and complete switchboard and station equipment. The car equipment will consist of 150 complete motor and series parallel controller equipments, the motors to be mounted on Peckham trucks. This contract follows closely that made for the equipment of the Clontarf line of the Dublin tramway system, which will be opened within the next week or two. The apparatus for this was also supplied by the British Thomson-Houston Company. The contract signed for the Barcelona and Madrid roads covers five 400-kilowatt multipolar General Electric generators and three of 75-kilowatt each, all to be directly connected to the engine shaft. While the three latter will be lighting generators, they will also be wound for 500 volts. This contract also includes full station equipment.

President Coffin of the General Electric Co. is understood to be in London endeavoring to secure contracts for important underground electric work in connection with the new railway in London. His agents are also at work in various cities of the kingdom to secure contracts on new electric lines. The sentiment throughout the kingdom is growing stronger every day in favor of electric traction systems for surface lines. In fact, there seems to be, according to officials of the company, no end of work in sight for electrical concerns. There is a perfect revolution going on abroad in methods of transportation. The statement that the General Electric Co. has $15,000,000 worth of contracts abroad is considered within the limits of truth. There was a sensation in London quite recently, when it became known that a corporation of Liverpool sent to America for an engineer to construct about five miles of an electric system. The engineers in London have been raising a vigorous protest, which has served to stir up manufacturing concerns in Europe considerably. This may make competition with American companies more severe, but American engineers say that they are too far in advance to be beaten by foreign competitors to any great extent at present. Both the General Electric and the Westinghouse companies have large offices in London and other important centers in Europe, with exhibition rooms which attract many visitors every day.

Mining Summary.

CALIFORNIA.

Amador.

D. R. Reese, superintendent of the Amelia Gold Mining Company's work on the Muldoon mine says while they have passed through several ore bodies it is the intention to go down 1000 feet with the shaft before starting a drift. The shaft is a two compartment one of 67 degrees incline.

Ledger: Ten stamps of the Kelly mill have been hauled to the Evans mine to work cement gravel.

At South Spring Hill Supt. Tregloan is cutting a station at the 1200 level.

The Jackson Exploration & Development Company is sinking. The shaft is down 720 feet—three shifts being worked. The 500 east crosscut has been driven 250 feet, and drifting south on the ledge is in progress, about 25 feet having been made. A surface crosscut has been driven on the hill, about 550 feet south of the shaft, and a very strong and well defined ledge 5 feet wide, showing free gold, was encountered 65 feet from the mouth of the crosscut. Drifting north and south on this is in progress with three shifts.

Crosscuts at the 500-foot level of the Pocahontas have been run both east and west. The manager intends to erect a mill.

C. F. Ross has had charge of the Baliol mine since August 1st. The 40-stamp mill is kept in operation on low-grade rock, which is quarried out of an open cut and put into the mill by cars running from ore chutes. One of the chutes dumps into cars, which run direct into one of the ore bins in the mill, while one of the others is 65 feet above, and the ore is dropped that distance. The third is quarried into a chute from which cars run to the fourth level of the mill, and are hoisted to the ore bins by an elevator.

The work of drifting in the south part of the South Eureka mine from the shaft has progressed 1200 feet on the 900, 1050 and 1250 levels, and now the work of crosscutting and prospecting the south end of the property is in progress. The new shaft, which is being run to tap the ledge about 300 feet from the south line of the property, is down 290 feet. The 20-stamp mill is pounding up about thirty-five tons of ore per day.

The representatives of the Anita Gold Mining Company have paid $10,000 on account of the purchase price of the Anita mine. The last installment of $10,000 will be due Feb. 1, 1898.

Butte.

Fred Bachman of Enterprise this week sold his quartz mine, known as the Crystal Hill mine, to an Oakland company to be known as the Crystal Hill Mining Company. This mine has been developed by two tunnels, one 250 feet in length and the other 500 feet long. There is a 4-stamp mill on the property and the rock pays exceedingly well.

At Magalia about fifty men are employed at the Magalia mine. Six men are employed at the Bader mine.

At the Carter quartz mine, near Nimshew, twenty-five men are working on the eight-foot ledge. Sparks & Judson have struck gravel in the tunnel at a depth of 200 feet.

Calaveras.

(Special Correspondence).—F. McNear has bonded the Buckhorn group of four mines at Murphy's and has begun work on the same.

Lewis Lane (son of C. D. Lane) has secured the interests formerly held by F. McNear in the Mexican and Rocky Bar mines, at Murphy's, and, with Naylor Williams, formerly superintendent of the Mattison, and later of the Carson Creek mines, will continue work on the same.

(Special Correspondence).—On September 23rd the Dutch mine paid dividend No. 3 of 5 cents per share; 150,000 shares. The owners of the Greek mine, near El Dorado, have purchased the plant on the Falcon mine, near Murphys, and are moving it to the Greek. The last ore shipped from the Falcon brought the owner $400 a ton at Selby's.

The Jupiter mine, Dogtown, which has become famous through the mysterious disappearance of its manager, W. Keefer, has put several hundred miners and Chinamen to work, constructing a ditch and reservoir, with a view of operating this coming winter.

The Dora mine situated on Indian creek, north of Murphys, has resumed operations. The Taylor mines at Murphys are being developed for the California Exploration Co. The Buckhorn mine at Murphys will be developed under bond by F. McNear.

Owing to a disagreement among the owners the old Soulsby mine of Tuolumne will remain closed down indefinitely. A number of proposed Klondikers have taken their outfits to Calaveras to prospect there until spring.

Murphys, Oct. 1st.

All the water has been pumped out of the Stickle shaft of the Utica mine and a full force put to work.

Citizen: A 5-stamp mill is being placed upon the Paragon in the R. R. Flat district under the direction of Percy L. Shuman. Doe & Jackson are building an arrastra upon the recently discovered Shadyside mine in the Prussian Hill district. Lamb & Cook took out a $700 pocket last week at the Sunnyside mine, Prussian hill district. At the Petticoat mine, R. R. Flat district, drifting still continues on the 350-foot level. Two ore bodies have been cut, each 4 feet in width, which mill between $40 and $50 per ton, the assay value going much higher. A mill will be erected. Jas. Cullen, superintendent of the Thorpe mine at Fourth Crossing, has fourteen men at work drifting on the 600-foot level. The 10-stamp mill from the Starlight mine at Old Gulch has been moved to the Demarest mine, the property of Demarest & Fullen, of Angels. Upon the return of Mr. Fullen from Mexico the mill will be erected and the mine put upon a paying basis. Supplies are being hauled to the Greek mine, near Banner mill, recently purchased by Smith, Fienberg & Hetzel. A mill is to be erected at once.

The hoist of the Fellowcraft mine, near town, resumed operations last Monday. Operations on this property have been suspended for several months, owing to its being involved in litigation.

El Dorado.

At the old Limpinsel mine J. C. Diamond, who has the property bonded, will sink a double-compartment shaft, 5x8, 200 feet before prospecting to any extent.

At El Dorado Supt. Vance of the Starlight mine proposes to connect the north and south shafts by a level at the greatest depth, 270 feet. The shafts are 550 feet apart.

The Alhambra mine, or Red Bob mine, a mile east of Spanish Flat, is to be reopened and prospected. Some rich bodies of ore were found and not less than $45,000 must have been taken from the mine within 60 feet of the surface. The deposit from which the rich ore came is a pipe vein. There is a shaft on the ground 90 feet deep. The pay gave out at a depth of 60 feet and it is believed that the "pipe" of ore may have been missed by the earlier miners.

Kern.

At Randsburg the Butte Wedge is down about 400 feet, the Little Butte 350 feet, with reported good prospects in each; the St. Elmo is down 200 feet, with double combination skaft and fine hoisting works; the King Solomon is down 240 feet. Other mines vary in depth from 50 to 100 feet, and some claims, on which as yet mere prospect work has been done, have reached a depth of over 100 feet each.

G. M. Rose, who bonded the Irene and May Queen mines, two miles west of Randsburg, has paid the balance of the purchase price and has ten men at work. On the May Queen he has run a 200-foot tunnel and uncovered a ledge of ore. The Irene has been opened up with two shafts and ore has been struck in each.

The Yorkshire Lass Mining Company has organized; capital stock, $5,000,000. The Yorkshire Lass mine lies near Randsburg.

The Los Angeles *Herald* says the Little Butte Extension Mining Company has incorporated at Bakersfield; capital stock, $1,000,000. This mine is an extension of the Little Butte. It was opened up by three shafts by its former owners, and a certified assay of ore taken from one of these shafts at a depth of 20 feet shows a value of $117.18 per ton. Contracts have already been let to sink two 100-foot shafts.

The Rand Mining Company has leased the Visalia mill at Garlock and will ship their ore to that place for treatment.

Work is progressing rapidly at the new stamp mill site. The excavating is nearly finished and a cement foundation is to be laid at once. The frame for the assay office is up and the structure will be completed in a few days. All the machinery will be shipped from Los Angeles, and it is hoped to have the stamps dropping by the 1st of next month.

The Johannesburg Water Company has reduced the price of water from 60 to 50 cents per barrel. They will furnish the stamp mill, when running, with 40,000 gallons per day.

At the regular meeting of the Miners' Union at Randsburg last Saturday evening forty-five new members were received.

Mariposa.

(Special Correspondence).—In spite of disquieting Eastern rumors the Merced property is operating as usual. No work is being done except in the Mary Harrison, where about 100 men are employed in stoping, most of the work being done between the 400 and 600 levels. The ore body, which was about 10 feet wide higher up, has narrowed to about 3 feet on the 600 level, but has increased proportionately in richness, and is now said to carry bunches of very high-grade rock. A little over 100 tons per day is being hoisted and handled by the 40-stamp mill, the last cleanup of which is said to have been very satisfactory, showing a considerable profit in operations for the month. As the main shaft is down less than 200 feet, most of the ore from the stopes has to be hoisted by a skip through the old incline shaft to this level and then run in cars some 250 yards to the bottom of the main shaft. As the present output taxes this shaft to its utmost, no attempt at development is being made.

Good progress is being made at the Red Banks, and it is hoped the crosscut tunnels will cut the ledge in the Crown Peak early in December. Should this vein show as good in the crosscut as it does on the surface, it will make a valuable property.

There is considerable stir in mining circles lately and a large number of properties are under consideration. A number of well-known experts have been looking over Coulterville properties lately, including Arthur Pearse of London, J. P. Mitchell of Colorado, R. G. Brown of Bodie, and Messrs. Wiltsee, Newhouse and Ewing of San Francisco.

At the Garibaldi work has been suspended for the present.

The small test mill at the Louisiana has proven so successful that an addition of five stamps is to be made at once.

At the Selleck mine drifting is in progress on the 100 level, and sinking goes on to the 250-foot level.

It is reported that Col. Thos. Ewing of Oakland will start up the Horse Shoe Bend mines. These properties were under bond to Mr. A. Cable, but he threw up the bond in order to go to Klondike. The properties are owned by P. P. Mast of Springfield, Ohio, and others.

San Jose parties, under the direction of a Mr. Hibbish, are sinking on the Big Betsey mine, about five miles north from Coulterville.

The 10-stamp mill on the Williams property, between Coulterville and Priests, has been started up and is running satisfactorily.

Coulterville, Cal., Oct. 2d, '97.

Eastern owners report that "the Merced Gold Mining Company is making cleanups and paying its way at the present time—in fact, there is a small surplus over expenses, but the management deems it unwise to permit any figures to be known until a longer running is had upon the rock to determine more accurately its paying qualities. The annual report which the company files in Montana, where the company is incorporated, showing $1,200,000 paid-in capital, $333,330 paid for the property and an indebtedness of $23,020 gives no information, as the company is not obliged to file a report of its assets, or even its cash on hand. The indebtedness shown is the pay roll and monthly bills, and the offsetting assets are not given in this report. The company has a surplus in cash and supplies over all indebtedness."

Mono.

Register: The rich strike reported to have been made by Indians near Benton is a gold ledge west of Black Lake. W. S. Couch is developing the property, and recently worked three tons of ore from it which milled $30 per ton.

Nevada.

(Special Correspondence).—At the Independence a new pump is being placed, water having come in on the hanging wall last week. The owners (Chavanne & Fricot) are much encouraged over the indications, though they had already found a fissure previous to this.

Dr. Reely & Geo. Reilley have leased their mining property, known as the Norwich, in Boston ravine, within the city limits, to Wm. Richards and others, who have begun work. the property adjoins Massachusetts Hill.

At the old Empire the development work on the 2100 has been so encouraging that the owners feel warranted in sinking the main shaft to the 2200. Current report has it that the new discoveries make this practically a new mine.

Grass Valley, Oct. 3rd, '97.

(Special Correspondence).—The Champion Company are building an additional pipe line from one of their reservoirs to the mill. The line will be 600 feet in length and of substantial material, in keeping with everything else about this model plant.

The old Merrifield, which was closed about three years ago, when the shaft had reached 250 feet, is again the scene of active work. The shaft will be continued to great depth. This is now the property of the Champion Company.

The old Eagle Bird, in the Maybert district, which has been idle for several years, has been leased for eighteen months to working miners who have begun active operations to reopen the property.

Nevada City, Oct. 4th, '97.

Tidings: New work is progressing favorably on the Old Norambagua mine, four miles southwest of Grass Valley, owned by Wm. Campbell. This property has produced a great deal of gold, but was never worked below 500 feet. Mr. Campbell proposes to pump and retimber the shaft and go to greater depth. There is a tunnel 1100 feet, striking the ledge at 500 feet. The ore runs as high as $60 per ton and the pay chute is the longest in the district excepting that of the old Idaho. The formation is granodiorite.

Transcript: The negotiations between the syndicate represented by Thomas Mein and the owners of the Nevada City mine are said by Mr. Mein's San Francisco representatives to have been declared off. The owners would not accept the terms upon which the syndicate were willing to proceed with the development of the property, the terms of payment and the price offered both being unsatisfactory.

Transcript: Schubert & Charonnat are sinking on the McCutchan mine and are taking out some rich ore. The Mayflower is being worked by the owners with encouraging results. The mill is running steadily. The prospecting operations at the Chapman Ranch mine, which have been carried on for several months under the direction of the owners, are resulting very satisfactorily. A fine looking chute of ore is being opened up and if the favorable development continues a little longer the erection of a mill will be justified. At the Standard (formerly the Oro Fino) Supt. Joseph Thomas is putting things in good shape for thoroughly prospecting the ground this winter for Messrs. Neff & Coleman, who have the property bonded from Messrs. Caldwell & Curry. The old shaft has been cleaned out and the machinery and buildings put in condition.

The Maybert miners who have an eighteen months' lease on the Eagle Bird have an agreement that if a buyer for the mine comes along before the lease expires they will be fully compensated for the labor and materials they have expended to such time as they give it up. It is owned by L. Loupe of San Francisco. Most of the time it has been operated at a profit, but for the last year and a half has been idle. It has an 800-foot incline and the lessees will work it on the 500, 600 and 700-foot levels. There is a good hoisting and pumping plant and a 30-stamp mill with four concentrators. The machinery is run by water from the South Yuba river, brought to the works by a mile of flume.

Placer.

The superintendent of the Pioneer reports that the tunnel going north on the vein in the south tunnel was advanced 8 feet during the three days ending Sept. 18, making this tunnel 32 feet north of the cross-drift in the south tunnel. The vein in the face of the tunnel is 4 feet wide, and the ore is very good. The ore in the stopes holds out with no change in character.

Eastern directors say of Pioneer: "It is considered assured that the stockholders will receive a dividend soon. Earnings are declared very satisfactory, with better earnings in prospect, and the cash resources of the company are over $100,000."

Colfax *Sentinel*: The Azalea mine, operated by the Blue Canyon Mining and Development Company, is two miles west of Blue Canyon on the line of the Central Pacific Railroad Company. The company holdings consist of 960 acres of land. The company issued 40,000 shares of stock of the par value of $1 each. The stockholders pay in installments of 1 cent per month, making a total amount of $400 raised each month. Eighteen installments have been paid in and installment No. 19 has been called for. The company is composed of 138 shareholders, a majority of whom are railroad men. The mouth of the main tunnel is on Tunnel Creek canyon, a distance of 1500 feet south of the railroad. The tunnel has been driven a distance of 422 feet with hand drills. The company has just completed putting in an extensive plant to furnish power to run a power drill. The water is conveyed to a point above the tunnel by means of 750 feet of flume and thence to the wheel through 330 feet of 6-inch steel pipe.

The Bear River Hydraulic Company have men building the flume and laying the pipe from the South Yuba canal to Bear river, where the company will put in a hydraulic elevator to work the tailings in the river. Seven cars of lumber arrived at Secret Town siding last week and 4500 feet of 22-inch pipe has reached Colfax. The pipe line will give a pressure of 450 feet. The company hope to be able to make a trial run during the month of October.

The upraise at the big Eureka Consolidated gravel mine, above Forest Hill, has reached the 180-foot mark. The rock is very soft and some clay has been encountered. Prospects are good for breaking through very soon.

Plumas.

The Donahoo Mining Company of Fresno purpose to drive a tunnel into the lava-capped plateau two miles north of the Buckeye house, on the Quincy and Oroville road.

At the Carriboo Consolidated Mining Company's property on the north fork of the Feather river the large wing dam has been completed and two water wheels put in. There is one 40-foot pump running. A derrick is now in operation, hoisting 100 tons of gravel and rock daily. The hole is now down 10 feet in the river bed and the gravel taken out is paying well.

National-Independent: At Johnsville the Jamison mine employs thirty men. Mill and stopes are full of ore, twenty stamps dropping regularly. Superintendent, Sam W. Cheyney.

At the Plumas Eureka mine fifteen stamps are running. Ten men are employed. It is presumed that when winter comes Supt. Johns will close down until spring.

At the Willoughby mine in Gold valley returns from a six days' run with nine stamps, $1100.

Riverside.

The cyanide plant at the Good Hope mine, in operation working the tailings from the mill, employs fifteen men. Sixty tons of the tailings are treated daily, the average amount of gold extracted is $5.86 per ton.

At Paris the Gavilan Mining Company are at work on their claim seven miles west of Perris. They are down 325 feet and have run four drifts. The value of the pay rock is about $50, and San Francisco parties have been investigating the proposition for a 20-stamp mill.

Shasta.

The *Free Press* says that the men who have been working the crevices at the bottom of the Sacramento river near Redding, in search of gold, have given up the enterprise on account of the expense. A diver was employed at a salary of $25 per day, and much gold was obtained, but not enough to pay expenses and net a profit. The company operated near the Diestelhorst dredger above Middle creek.

The *Miner* hears that Simons & Weil, the principal owners of Windy Camp group of mines on Squaw creek, have agreed to give Hill and H. P. Winslow an extension of six months on the bond now held on that property. The bond was secured by Mr. Hill when he was manager of the Mountain Copper Company, Ltd., and he bonded it to the company.

The big blocks of high grade sulphurets recently brought to Shasta from the Behrens and Leivsay and the Bell and Scranton mines, on the west side of the Middle and Clear creek divide, says the Shasta *Courier*, are pretty good indications that large and valuable ore deposits honeycomb the entire ridge.

Near French Gulch, at the Three Sisters, owned by Ellery Bros., Cannon & Ellis, operations have ceased, the lessees claiming that, owing to the very brief period before the expiration of the lease, they would be unable to realize on the outlay of putting in expensive pumping works. The quality of the ore is unquestioned.

Free Press: Riordan & Shepard have recently leased from Gleaves & Baltzell the mining dredger which was built by the Shasta County Mining and Dredging Company. They cleaned the machinery and are now operating the dredger on the Sacramento river below Turtle bay.

Parties have just finished a boat at the Reid ferry for the purpose of conducting experimental mining operations at the bottom of the Sacramento river between the ferry and Middle creek. A cylinder or caisson of iron will be sunk vertically in the river and the water inside pumped out. A miner will then descend a ladder placed inside the cylinder and the gravel will be hoisted and washed for the gold contents.

Siskiyou.

Yreka *Journal*: Quartz from Morrison & Coburn's ledge in Quartz valley averages $30 per ton, the ledge varying in width from 6 to 16 inches. In one spot, a rich pocket, they found quartz which assayed over $17,000 to the ton, and may be able to strike more of the same sort as development work continues. It is known as the old Store ledge, from which the late Judge Steele realized over $50,000 in the early part of the '50 period, with very crude machinery for crushing the quartz. The quartz is taken to the new Erno mill. Great preparations are in progress for good winter work at mining all along the Klamath river,

in the Seid and Happy Camp sections, where there is an extraordinary scarcity of water at the present time, without any hope for a supply until winter rains commence.

Journal: The three years' litigation that has kept the Boyle mine closed and the entire property idle, has at last been satisfactorily settled, and the mine will be opened up immediately and put on a paying basis. O. O. Howard, Jr., of San Francisco, has settled with all creditors, and now has possession of the mine.

At the Katie May mine, on Greenhorn, Bailey & Carrick are running a tunnel and hope to strike the ledge within the next 10 or 15 feet.

Great activity is being displayed in quartz mining in the Humbug district, and some of the ledges in that section are to be developed on an extensive scale. Many of these ledges would justify the erection of a mill on them, as it has been satisfactorily proven of late, that ledges run down to a great depth. Quartz mines have not been extensively developed in this county in the past, most of the mining having been confined to hydraulic placer mining on the rivers.

All the river mines in Honolulu district from Humbug creek to Virginia Bar and Honolulu, are now worked day and night and Sundays, in order to get out all the gold possible while the river is low. Every claim is reported as yielding good pay, especially the old Phil Mott claim.

Sierra.

The mill at the Northern Belle mine is being moved to Downeville, where it will be put up on the mine at Slug canyon.

Messenger: There have been three mines bonded within the last week—the Sacred Mound, the Kentucky by R. Phalen and the Arctic near Gold lake by W. O. Peck of Loyalton. R. Phalen has men putting in a restraining dam on the Hilda. The Pride Mining Company are getting things in readiness for their spring work. The New York mine is still employing a few men.

Sonoma.

On the Stump ranch, near Bodega, Verrue & Stump have erected a separator on Mr. Stump's place, near the shore line of Bodega bay, and are washing the black sand for gold.

Trinity.

The *Journal* says several new discoveries have been made in the New River section of that county. The Jumbo mine is reported as bonded, upon which considerable development work will be done this fall. The Mountain Boomer, at New River, is yielding good ore, and the Sherwood mine is looking well. The mountains in that section at Siskiyou border are full of prospectors and many good strikes will be made. There is no better field for intelligent prospecting in the State than the section extending from East Fork through Rattlesnake and New River to the Know Nothing Creek mines in Siskiyou county. In this section are a number of paying mines, and the country has not been fully prospected.

Scarcely an echo of the Coffee Creek "boom" is heard now, says a *Bee* correspondent. If it is spoken of at all, it is with a smile. The rumors that have floated about during the past week have been as preposterous as were the reported strikes that followed so thick and so fast when the San Francisco "staff correspondents" got up to the headwaters of Coffee Creek. Coffee Creek has long since given up its hundreds of prospectors; but it received tremendous advertising for a while. Two hundred locations were filed with the County Recorder at Weaverville as a result. Nothing great has resulted from it all. The Graves brothers were made famous, and comfortably rich. Like good fellows that they are, they have gone back to their humble homes, not puffed up with pride but digging away on a good prospect just as thousands of other miners are doing in California to-day.

Tuolumne.

(Special Correspondence).—An Oakland company represented by Mr. Shanklin has bonded the Landers Ranch, adjoining the Black Oak mine, about a mile from here, and will thoroughly explore the ground with a diamond drill. This means still more for the advancement of the mining interests on the east belt, now already having such an impetus from the satisfactory way developments are showing good values in the mine.

The Black Oak, on the 800-foot level, has 25 feet of solid ore between walls—not a pound of waste to hoist. The first class is selected by hand by Chinese labor and they are experts at the business. This is shipped to Selby & Co. for treatment and returns from $80 to $106 per ton net. There is shipped 150 tons monthly. The milling ore runs $30 and 25 tons per day is crushed. The tailings run $7, of which 90% is saved by cyanide. The sulphurets are very rich. The improvements at the Black Oak the past year were on a very large scale, and the cyanide plant, which has been greatly enlarged under the direction of an engineer sent directly for the purpose, is one of the best in this county. Later on the company anticipates treating all their own ore, excepting the milling ore, by the cyanide process.

Mr. Campbell is developing a good, strong ledge on the Burns Ranch, supposed by some also to be on the Black Oak lead, for some parties in the city. He is now in the city buying better machinery.

The Gold Bug mine, adjoining the Black Oak, is taking out some phenomenally rich ore. The assays from the ledge in the bottom of the shaft, now down 50 feet, give $240 per ton gold. The concentrates taken from a soft material between the walls, about 2 feet in width, went $1087 per ton, while the washings from a panful of fine quartz picked from the hanging wall yielded $440 per ton gold and 25 ounces silver. The ore is similar to the Black Oak: lead and iron sulphurets—base but rich. The company has just completed an excellent hoisting plant—one of the most complete for its size in the county. The principal stockholders are State Senator Burns of San Mateo, Judge Fitzpatrick of Redwood City, Hon. E. L. Campbell of Palo Alto and Col. Woodrow. We do not hear of any Klondike ledges as rich.

The Carlotta and Pennsylvania, between this place and Summersville, are also turning out in a manner most gratifying to their owners. At a depth of 100 feet they have from 18 to 24 inches of $30 ore. They have a new hoisting plant.

The Yellow Jacket, also near here, has been bonded by Mr. Trittenback, president of the Dutch Company on the mother lode. They are grading for a hoist.

Capt. Hooper of Michigan has been appointed manager of the Old Soulsby, and is on his way here to open it up. There are some surprises in store about here in the near future in the way of developments of great value. How is it that this county has lain dormant so long?

The Dead Horse at Summersville, now down 1400 feet, is doing better than for years, while the Seminole at Cherokee is to have a new mill and hoist and resume operations.

Soulsbyville, Cal., Sept. 30, '97.

Independent: At the Rawhide both furnaces are running day and night to their fullest capacity. On assaying the slime saved from the pits and the tailings generally it was found that they gave a return of over $30 per ton. The management presumed that a good deal of the gold passed off in the slimes and took the precaution of tanking it. The reduction or chlorination of the above is one of the principal products of the last cleanup.

The Tarantula management is grading extensively on the east or hanging wall of the shaft so as to put in powerful machinery for hoisting purposes.

The Alameda main shaft is down 560 feet, 60 feet being allowed for the sump. Sinking will not be resumed until the pumps are replaced.

At the Rappahannock a large hoist, enabling Supt. Chute to sink from 1000 to 2000 feet, goes in.

Two hundred feet of water has recently been pumped out of the Badger. The shaft is 250 feet deep. It has been sunk through a body of ore from top to bottom. On the surface the vein is 2 feet wide and has grown in width.

Yuba.

Hibbert & Burris have secured the land upon which the Flag mine at Brown's Valley is located. The Old Flag Mining Company of San Francisco have an option on this property, which expires on the 14th instant.

NEVADA.

The Dexter Mining Company are going to put in a $100,000 plant at Tuscarora.

Virginia *Enterprise*: The Justice Mining Company are about to resume operations to thoroughly prospect the three-cornered piece of ground which the company recovered from John Barclay et al. This three-cornered piece of ground lies within the boundaries of the Justice patent. Some years ago it was jumped by Barclay and his partners, who went some 400 feet from the Woodville shaft down the canyon and sunk a winze from which they ran two drifts. In both of these drifts they struck good pay ore and had a good thing when the Justice Company instituted proceedings to oust Barclay and his partners. The case was decided against Barclay by the U. S. Court of this State, which held that the Justice Mining Company owned the ground in question because they had a deed to it from its previous owners and locators. The Justice Company has now started to erect a whim over the shaft sunk by Barclay and his partners and will sink and prospect the ground to some extent. If the result of these operations is favorable at the Barclay shaft other operations will again be resumed at the Woodville shaft, which is a good many feet deeper than any work done by Barclay and his partners. Parties who have visited the Barclay workings claim that a very good thing has been shown up there and that if the ore bodies opened up are found to go down, and that if connection is made from the lower levels of the Woodville shaft the Justice will become one of the biggest producers on the Comstock. It is about two years since the Justice Company did any work on their property.

The Dexter Mining Co. at Tuscarora will build a 40-stamp mill. Coal at $17 and $18 per ton is too expensive and electricity is decided upon as the motive power. The entire plant will cost in the neighborhood of $100,000, and it is expected that the stamps will drop January 1st, 1898.

Lyon Co. Times: The Mason Valley copper smelter has started up. Messrs. Nelson and Hardy say the plant cost them close to $50,000. It is of 40 tons capacity per day. It is understood that the price for working will be $7 per ton.

Silver Peak correspondent Hawthorne *Bulletin*: Work on the hill mines goes on day and night, and the piles of ore are increasing rapidly. The only drawback is the cost of transportation. Wood has to be hauled over the worst roads on earth for twelve to fifteen miles, while the ore is brought down hills so steep that it requires three shoes to two wagons to keep them from running on the horses.

The leaching plant started up a few days ago. The tanks have a capacity of twenty tons. A band of Comstock miners came in last week to open up the Blair mine and they will have no use for a pick. Six picks to a ton of powder is about the average.

OREGON.

The Belcher group of mines, near Sumpter, Robinsonville district, Jackson county, has been sold to H. G. Snyder and associates of Utah, by Stein, Larson & Dentor, for $25,000.

C. L. Manning and Wm. Steck of Grants Pass have sold their interest in the California and Gold Bar placer claims on Silver creek, a tributary of the Illinois river, to Geo. Phillips of San Francisco, for $11,250. Recent reports show the gravel on this claim to be from 25 to 35 feet deep and rich in coarse gold. Mr. Phillips has brought from California a complete hydraulic plant to work this new claim.

BRITISH COLUMBIA.

At the Jennie, Ainsworth, the No. 5 and another claim, adjoining the Highland mine, have been sold to Brown and Tomlinson for $15,000.

At New Denver the Queen Bess, near the Idaho, has been sold to C. K. Millbourne, representing a London company, for $150,000—$35,000 down. The new company will take charge of the property next month and will work it on an extensive scale. R. C. Campbell-Johnston is manager for the new owners.

Regarding operation and further development of the Payne mine at Sandon, the surface tramway which connects the mine with the railway is completed and in operation, increasing the output to 100 tons a day. The advance in lead has been a source of great relief to the producers in that locality, as it about offsets the duty and saves them from what threatened to result in many hardships.

At Fairview the new 20-stamp mill of the Tin Horn mine will be finished within thirty days if the present plans of the company are carried out. The Morning Star Company, operating the mine of that name, has let a contract for the erection of a mill. The Joe Dandy Mining Company has also commenced work on a new mill on its property. The Smuggler mine is running. The proprietors have rented a 10-stamp mill. There are now about 300 men working in and about the camp and there will be 200 more put to work within the next thirty days.

At the Cariboo mine, J. B. Hobson has men at work preparing for the new ditch to be built from Morehead lake, thirteen miles, and when it is completed will give the Cariboo mine sufficient water to run the mine, as at present the water is limited and they only have it for a few hours a day. Another cleanup will be made this fall. A few days ago a large blast of nearly 700 kegs of black powder was set off, knocking down about 75,000 yards of gravel into the pit.

Review: By a vote that was practically unanimous the Josie Mining Company decided at a meeting of the stockholders Oct. 1 to give to Thomas Ricards an option of sixty days on the property. Mr. Ricards was represented at the meeting by S. L. Lowe, who submitted a proposition to the meeting in writing offering to incorporate a company under the laws of England with a capital of £250,000. This company, he agrees, shall pay to the Josie Mining Company £10,000 in cash and place in the treasury £40,000 in cash as the proceeds of the sale of stock at par to that amount. The Josie Company is also to receive £100,000 in fully paid stock. The offer further stated that the details of the transfer would be arranged by Mr. Ricards with such representatives of the Josie Company as should be authorized to act.

Rossland *Miner*: The Monte Cristo mine has passed out into the possession of the new company, and on Monday thirty-five men were put to work in the mine. G. E. Pfunder is manager. The property is now owned by a syndicate of Montreal and Chicago capitalists. The new company has ample capital to carry on the development work. The Monte Cristo Company is organized under the laws of Washington.

ALASKA.

Record: The mill of the Nowell Gold Mining Company at Sheep creek will start dropping its thirty stamps soon, the new addition to the plant being completed. An ample supply of ore from the Queen and Glacier mines is now in reserve, and the 30-stamp mill will run to its full capacity during the winter.

UTAH.

Tribune: Tired of chasing silver in its ups and downs, the management of the Bullion-Beck has decided to stop the extraction of ore at once. For months the operation of the property has been at a great sacrifice. The Bullion-Beck has distributed $2,117,000 to date. Among other results of yesterday's action will be the dismissal of fifty more competent miners, who will be compelled to seek other camps for employment. Many of them have families, many lost in the failure of the bank at Eureka, and it is feared that not a few will experience hardships this winter.

IDAHO.

On the Salmon river, Custer Co., the Lucky Boy mill and mine are running steadily. The mill crushes forty-five tons per day.

The Black mine has changed hands. The new proprietors will erect a 10-stamp mill at the mine. Heretofore the ore has been worked in the Fourth of July mill, a mile away, at great expense. H. J. Jory of San Francisco has charge of the construction of the new Black mill.

The Hailey *Times* says C. M. Rolker, a mining engineer, has been examining the Crœsus group of mines. He represents an European syndicate—the German wing of the Exploration Company of London, England. It is stated the Crœsus is under bond to this syndicate.

The Newberg and Alice mines—the former better known as the Lawyer—a short distance west of Quartzburg, are sold to Wm. Church of Denver, Colorado, for $18,000 cash. Six Kincaid mills, with a capacity of ten tons each in twenty-four hours, will be put up. The ore of the Newberg and Alice is very soft and can be cheaply mined. Mr. Church says the cost of extracting the ore and conveying to the mills will not exceed 70 cents per ton. The Newberg has been developed by two tunnels, the lower one 700 feet in length, which taps the ledge at a depth of about 300 feet. Eleven tons of ore taken out and crushed in the Iowa mill, for the purpose of determining the average value of the ore, milled $6.14 per ton.

Silver City *Avalanche*: Work is being pushed on the Alpine; the promise of a good mill run this fall is almost certain. The mill run of eleven tons which was had in August went about $100 per ton.

The mortgage given by the Flint Mining Company last February to cover the attachment made for labor performed was settled in full this week by the payment of about $2800, and the mortgage was released.

The Poorman mill, which is being fitted with a new electro process, will be in running order in two weeks.

MONTANA.

The mortgage for $1,500,000, placed last year upon the Montana Ore Purchasing Company's smelter and mines, has just been discharged.

Twelve dollars a day to the man is the record of the Nelson gulch placers operated this summer by C. P. NanWar & Co. The result of the season's cleanup was announced Saturday, according to the Helena *Independent*, and the news was enough to have caused a stampede up Ten Mile if it had not been known that every inch of gold-bearing ground had long ago been claimed.

Butte *Inter-Mountain*: In line with the development work recently started at the other big copper mines of Butte, the Colorado Company has begun the development of the Gagnon shaft from the 1400 to the 1500-foot level. A hoisting engine has been placed at the 1400-foot level for the purpose of sinking, so that operations at the upper levels will not be interfered with.

At its present depth the Gagnon is, owing to its location, probably the deepest shaft in the camp. The High Ore No. 2 is 1400 feet, but its elevation is probably more than 100 feet above the collar of the Gagnon shaft. At the High Ore and almost every other Anaconda property, development of the shafts is in active progress, so that by the end of the year there will be at least half a dozen mines of a depth of 1800 feet each.

COLORADO.

According to a report from Mound City, J. Q. McDonald, manager of the Brodie mill at that place, has succeeded in cheapening the process for extracting gold from certain ores and working a larger saving of values by the addition of concentration to the cyanide leaching process. The ores now treated at the mill, whether oxidized or sulphides, are leached raw in the cyanide tanks, the principal values being extracted in that process. All of the pulp is then run over the concentrating tables, and the concentrates saved are roasted and then returned to the leaching tanks. Instead of remaining in the solution from eight to fourteen days, as formerly, the treated pulp is now kept there but four days; and by putting the pulp through the concentrators "the value is saved down to 50 cents a ton, against a loss of from $2 to $8 when the tailings were drawn off without concentration. The roasting of the concentrates is accomplished without loss, whereas the loss from fine dust in the raw ore was considerable. Before this new scheme was applied, the Brodie was losing money on every ton of ore it treated; now it is making money and has already begun to enlarge the plant. Two new solution tanks of thirty-five tons and four leaching tanks of 140 tons capacity each have been ordered, and with them two additional concentrating tables to assist the four now in operation. The mill is at present treating 3000 tons a month, against 1800 tons formerly handled by the same plant. Of course, the new system can be employed by others, and its effect should be to cheapen the cost of treatment ultimately to the producers of the ore. The mill problem has been a serious one. It is an open secret that none of the mills have been making money, even at the prevailing rates of from $6 to $8 a ton for treatment, and no reduction in rates could be expected until this situation was remedied. Millmen will find much interest in this new adaptation of the two old processes."

In northern Colorado there are about twenty-five producing coal mines. The consumption of the output is confined to Denver and northern Colorado points and is about 400,000 tons of lump coal annually—an average output of about 16,000 tons of lump coal to each mine. Of this amount probably 12,000 tons are consumed during the six summer months, or 800 tons per month, or 35 tons per day. The cost of this coal can be very closely approximated. The district price paid the miner for mining the coal is 80 cents per ton. To keep the mine in a safe and workable condition and to handle the coal dug by the miners there are required, say, two men to take coal from the mines and put it on the cage ready to be hoisted to the surface; two men to keep roads, entries, etc., in condition; two engineers—one days and one nights—one blacksmith, one dumper; these men are all paid $3 per day, or $24; two boxcar men to shovel coal in railway cars at $2 50, $5; one superintendent and one clerk, $6; making in all $35, or $1 per ton; mining, as stated, 80 cents; timber (props), 10 cents; rails, repairs, etc., 5 cents; royalties, average, 15 cents; making cost per ton, $2.10.

Salt Lake *Tribune*: The Hill Top mine is at an altitude of 12,000 feet, twelve miles from Fairplay. It is a silver and lead property; the lead values such that a good profit is realized from taking out the ore. The shaft is 500 feet deep, and from the bottom the workings extend in all directions. One ore chamber made by excavating the ore, is 22 feet wide, 200 feet long and 70 feet high. It is three miles from the mine to the railroad. The ore is conveyed by a tramway that works automatically. There is a large, endless cable to which buckets are fastened, and the weight of the ore is sufficient to keep the wire in motion and return the buckets to the mine after they have emptied their contents below. When the buckets leave the mine they gradually descend to the cars, where they are, by a mechanical contrivance, turned upside down and the ore is emptied into a bin. The buckets remain in this inverted position until they reach the pulley at the mine, around which they go before making another trip, and as

they come around they are thrown into their proper position. Then as each bucket gains a given point an ore chute reaches over the top of the bucket and travels along with it until it has filled the bucket. Then the chute returns to its original position, and is ready for the next bucket. The whole system is operated by one man, who is stationed in such a position that he can see the entire length of the cable and instantly note any irregularity in the working of the contrivance. For instance, if the ore chute should fail to travel with one of the buckets, the operator, by touching a lever, can immediately stop the machinery and mend the difficulty. Men do not work for wages, but all do piece work. Two or four men will work together, and when they have filled a car with ore it is wheeled to the shaft, placed on the cage, and drawn to the surface. There it is weighed, and the weight is registered and credited to the men who excavated the ore and put it on the car. Each set of men fastens a ticket to the car, and it is by this means that the man on top knows to whom to credit the ore. The men receive 90 cents a ton. When working by the piece this way they do more work than when working by the day. When it is desirable to drift, make an uprise, sink the shaft or do any kind of dead work, a contract is made with the men to do the work at a fixed price per foot. Many of the men make as much as $4 a day at the rate paid for taking out the ore.

Central City *Register-Call*: A visit to the mills found the following number of stamps dropping:

	Stamps.
Hidden Treasure, Black Hawk	75
Bobtail, Black Hawk	75
Mead, Black Hawk	40
Polar Star, Black Hawk	40
Eagle, Black Hawk	35
Gilpin, Black Hawk	50
New York, Black Hawk	75
Randolph, Black Hawk	50
Iron City, Black Hawk	25
Kansas, Nevadaville	40
Vendome, Nevadaville	30
Rollins, Perigo	25
Peterson, Gilpin	10
Total	570

Of the above 570 stamps, 480 are slow-drop and 90 are rapid-drop stamps, which are treating a total of 700 tons every twenty-four hours. The Rocky Mountain concentrator is treating daily 75 tons per day, while the State Ore and Public Sampling Works treat together about 125 tons per day. Therefore, including concentrators and sampling works, the daily tonnage treated throughout the county is 900 tons. Add to this the daily shipments of smelting ore which are made direct to the smelters at Denver and Pueblo, and it will be readily seen that the total tonnage is very close to 1000 tons of ore every day.

NEW MEXICO.

Hillsboro *Advocate*: Some of the owners who will not give working bonds to their mines without cash payments no doubt intend to keep them for another ten or twelve years just as they are. When a mine is idle it is a pretty fair presumption that it will not pay to work; and when parties appear willing to put their money and time into development, and are willing to bind themselves to definite work, it would seem wise to give them a chance within reasonable limits. But it is a free country and you have a right to keep on with your annual assessments for another century or so.

Silver City *Enterprise*: The Confidence mine is working about seventy men, and an abundance of ore is being extracted to keep the mill running steadily. Work is being pushed rapidly on the pipe line which is to furnish water power for the plant and to generate electric force for other work. The line will soon be in operation and everything about the mine and mill will be economically operated by water power and electricity.

ARIZONA.

Talking of the Vulture, G. W. Treadwell, who put up the 80-stamp mill on the Vulture mine, which in its time made millions for its owners, says the property is far from being worked out, and that the only reason that it cannot now be worked with profit is the fact that there is no wood within thirty miles of the mine. The mine is down but about 200 feet, and there is evidence that there are thousands of tons of high-grade ore in the mine. Sixteen miles from the mine there are never less than 300 inches of water, a fall of about 25 feet to the mile and enough to generate electric power to be transmitted to the mine. If this could be done (and it is practicable) the Vulture would employ 200 men.

At Globe the Old Dominion copper mine has now about sixty men at work mining, but has produced nothing since the shutdown, except the ore necessary to be taken out to make development. The mine is now well equipped with two horizontal 150-ton water jacket furnaces, and should produce regularly after the railroad is built 2,000,000 pounds of copper per month. The cost should not exceed 6 cents per pound laid down in New York. Supt. Garland says the railroad will be built.

Prescott *Courier*: From the mill and mines of the Sundance Company information is received that 200,000 pounds of concentrates have been shipped from that camp in September, and by the 20th of October it is expected that the output will reach 20,000 pounds a day. The ore is taken from the Aztec and Silver Trail mines. The Aztec ore is said to run $35 to $40 per ton, and the Silver Trail from $50 to $100.

MEXICO.

The Yaqui gold region is described as a rolling valley about thirty-five by sixty miles in area. The gold is found in the foothills at the edge. It is reached by road from Ortiz station on the Sonora Railway, 215 miles south of Nogales and fifty miles north of Guaymas. The gold is coarse. In the vicinity are quartz ledges with free milling gold ore.

The manager of the smelters of the Guggenheim syndicate at Monterey and at Agua Caliente has notified his men that hereafter their salaries will not be paid in gold, but will be in Mexican silver, at the ratio of two Mexican dollars for one gold dollar. It is reported that the same action will be taken by the railroads and other foreign corporations in Mexico toward their office employes.

The Recompensa mine, a silver producing property, in the Charcas district, State of San Luis Potosi, adjacent to the El Tiro General mine, has been sold to Pittsburg, Pa., men for $75,000. Assays from the Recompensa are reported to run from 33 to 142.50 ounces of silver, with 1.27 ounces gold and 40 per cent lead. But little work has been done.

The New York & Sonora Smelting Co. is the name of the corporation J. B. Magruder has formed in New York City to erect a smelting plant at Last Cruces, about thirty miles from Hermosillo. Two sixty-ton water jacket stacks are expected to be ready in February, '98.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

FOR SALE CHEAP.

1 New Giant Drill

Arranged to run by AIR or STEAM.

With Column Clamps and Numerous Extra Parts. Apply to MILLER, SLOSS & SCOTT, 18 Fremont Street, San Francisco, Cal.

FOR SALE CHEAP.

Gold Wet Washing Machine,

MAIT'S MAKE.

Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

FOR SALE.

2 Williams Patent Water Jacket Furnaces.

The above furnaces are new, having been left on our hands through failure of parties for whom built. They will be sold at a bargain. Address W. T. GARRATT & CO., Corner Fremont and Natoma Sts., or apply at works, Corner Fifth and Brannan Sts.

WANTED.

By a graduate mining engineer (age 29) any position in a mine, mill or office that may lead to advancement. Have my own surveying outfit. Address L.C., office Mining and Scientific Press.

WANTED. — A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B. this office.

WANTED.

Position as Master Mechanic

With Any Reliable Mining Company.

Am familiar with all types of engines, boilers and pumps to date, and competent to build and repair any machinery in the mining business. Have good discipline and good experience. Will go any place. Address "A," care Mining and Scientific Press.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street ..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid $1 75

Prospector's Field Book and Guide.
By H. S. Osborn $1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid $3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated $5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid $5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid $6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated $5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth $2 00

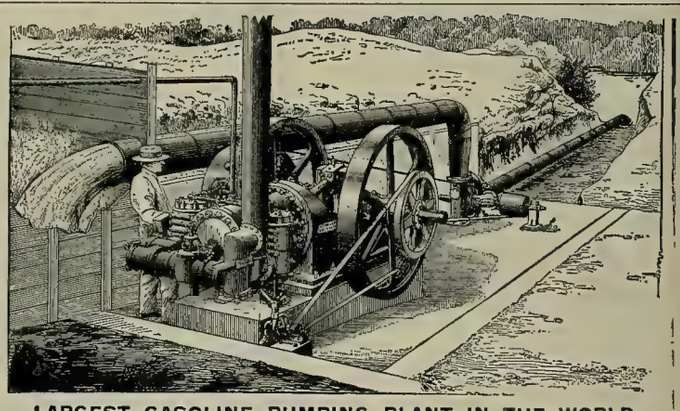
Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth $1 50

Quartz Operator's Handbook.
By P. M. Randall $2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid ..... 50 cts.

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid $2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather $5 00



LARGEST GASOLINE PUMPING PLANT IN THE WORLD

The illustration shows the gigantic pumping plant recently built by the Hercules Gas Engine Works on the Packer Ranch, Colusa Co. 80 h. p. Hercules Engine, pumping 7200 gallons a minute, 27 feet high. Burns Gasoline or Distillate oil. Cheapest power known. Gas, Gasoline and Oil Engines, 2 to 200 h. p. Send for Catalogue. UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

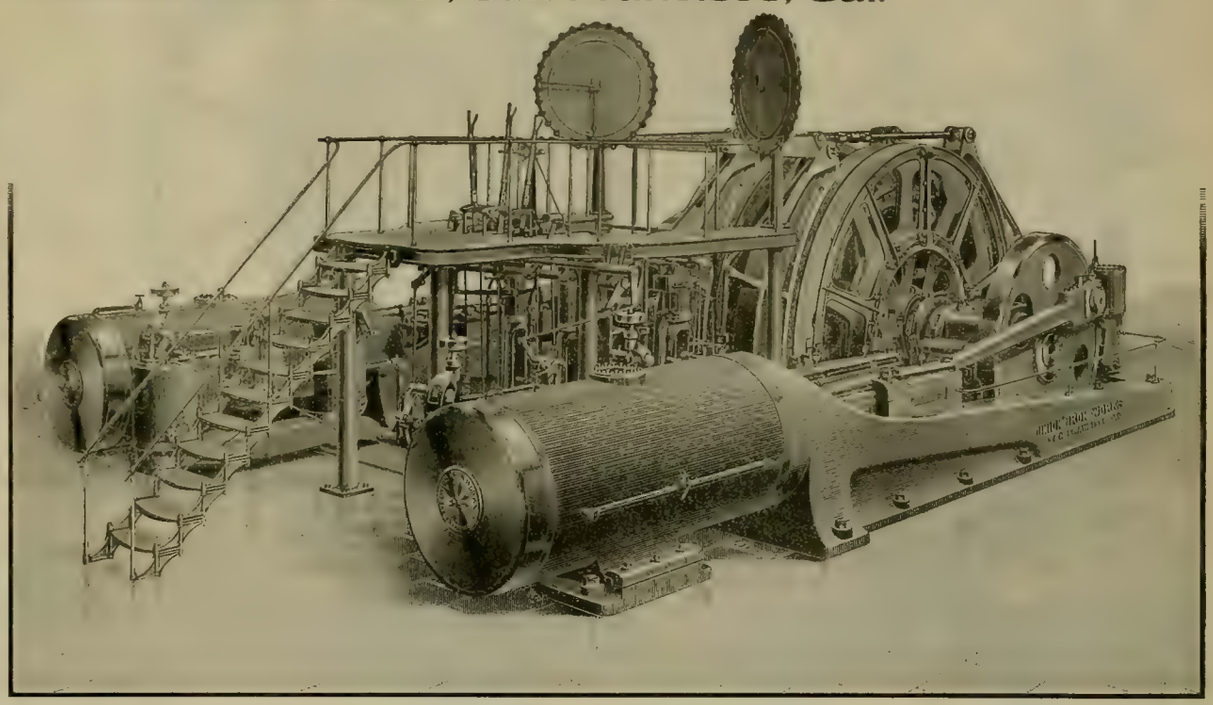
30 in. x 72 in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

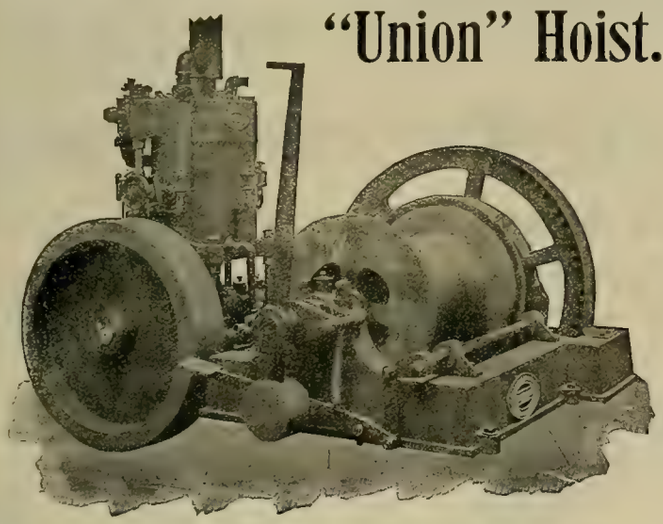
OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1600 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

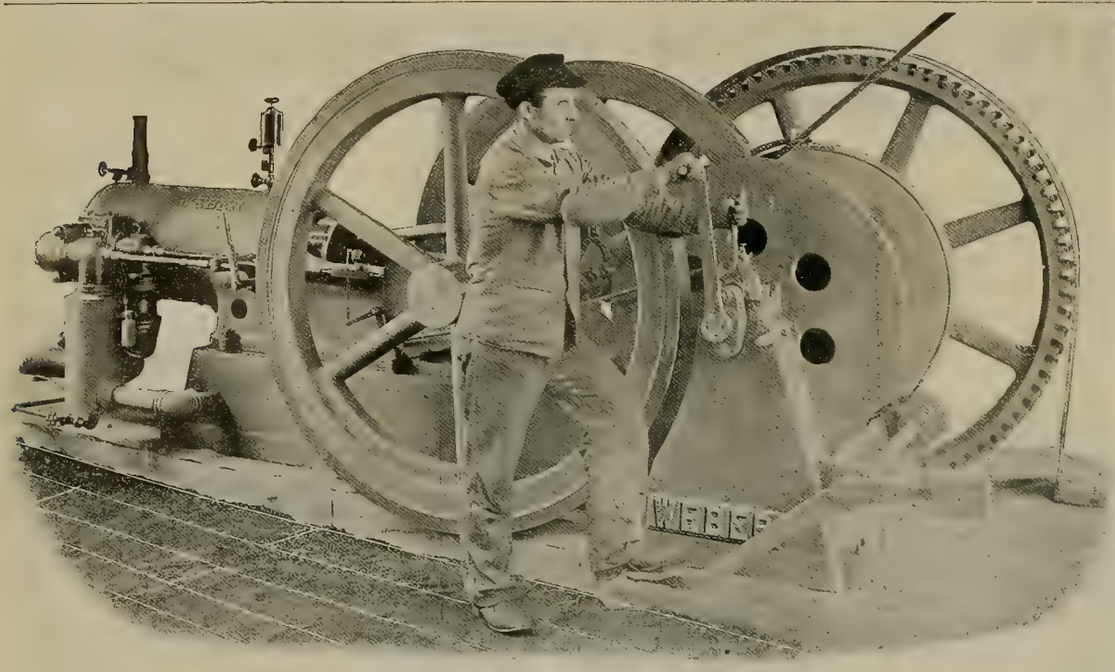
Catalogues on Application.



Hoist Operated by a Gas Engine.

The cut herewith shows a 50 H. P. geared single drum hoist, manufactured by the Weber Gas and Gasoline Engine Company of Kansas City, Mo. The works of the company are located at 430 Southwest boulevard, in that city, and are completely equipped for turning out engines of any size up to 50 H. P., and suitable to all purposes for which gas engines are employed. The machine weighs about 12,000 pounds. It is compact, and will go into a room 7x13 feet 72 in. The manufacturers state that these hoisters are so arranged that, by changing the ratio of the gearing and the size of the drums, the company can give almost any lifting capacity with a corresponding foot travel—either high speed machines for light work, or slow speed machines for heavy work, as may be desired. A large number of these machines are used for underground hoisting and pumping. The manufacturers direct special attention to the feature of using one heavy base casting, on which all of the machinery is mounted, making the alignment perfect and continuous. These hoisters are in use by the Consolidated Kansas City Smelting and Refining Company, the Philadelphia Smelter Company, and other equally prominent concerns. Mr. H. B. Hanna, manager for the Gopher Gold Mining Company of Chaparal, Ariz., under date of June 7, writes the Weber Co. that the geared hoist has been in continuous operation since May 23, doing everything guaranteed with perfect satisfaction. All of the Weber engines can be operated to use either gasoline, city gas, distillate or crude oil. The company issues a very neat catalogue, pertaining to Weber gasoline hoisting engines, which will be sent to interested parties on application. This catalogue also contains a list of supplies, such as rope, water barrels, ore buckets, trolley cars, gongs and dump cars.

Prospecting IN THE Klondike.

Box 1208, SCRANTON, PA.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

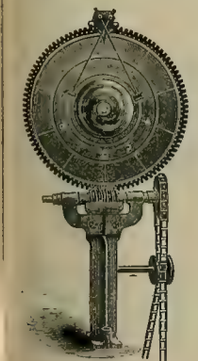
"KEEP YOUR EYE ON THE INDICATOR."



Patented March 28, 1893.

The Bolthoff Automatic Signal Alarm Indicator.

HUNDREDS NOW IN USE. UNIVERSALLY RECOMMENDED.

It is without question the most accurate indicator for hoisting engines ever constructed. Not only is there no lost motion, but it has the valuable feature of a device whereby automatically the approach to station, curves in the shaft, bad places, obstructions, or, in fact, if for any reason the engineer desires to be warned of the approach of the cage or bucket to any particular point in his shaft, either in hoisting or lowering, he can set it so that the signal bell will automatically sound its alarm.

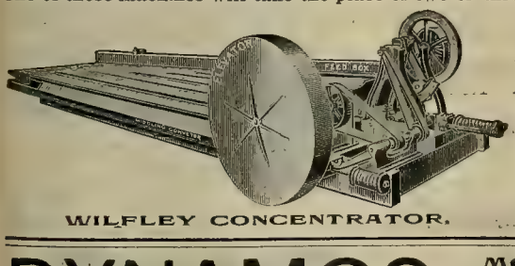
Constructing Engineers and Millwrights,

306 PINE STREET, SAN FRANCISCO, CAL.

SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

DYNAMOS.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INK FOUNTAIN FOR PRINTING PRESSES.—Clemens E. Kayser, Oakland, Cal. No. 590,790. Dated Sept. 28, 1897. This invention relates to an improvement in ink fountains, such as are adapted to be used in connection with printing presses. It consists essentially in a means for adjusting the blade or scraper with reference to the roller so that the flow of ink is regulated. In distributing ink from the fountain to the point where it is to be used, and with a fountain of considerable length, the adjustment of a blade or scraper is a different matter. It is the object of this invention to make the adjustment easy and accurate. It consists essentially of the combination with the roller and scraping blade of inclined or wedge-shaped bars extending longitudinally beneath the edge of the blade, and means for removing one or other of the bars so as to accurately adjust the edge of the blade with relation to the roller. It also consists in the employment of independently acting screws extending upward through the bars with the ends pressing against the blade so that portions of the blade may be adjusted independently of the general adjustment.

MANUFACTURE OF METALLIC TOOTH CROWNS—L. L. White, San Francisco, Cal. Assignor to the L. L. White Tooth Crown Company of same place. No. 590,799. Dated Sept. 28, 1897. This invention relates to the manufacture of seamless metallic tooth crowns. It consists essentially in fitting an attachment for the crown forming a contour of the same by fitting a metallic band to the root, filling the band with wax and pressing the face of the occluding tooth and forming the cervical and opposite margins to fit the festoon of the gum, then filling the band with a substance which is given the contour of the tooth, molding the same in plaster of paris, then removing the soft imitation tooth and replacing it with a cast of fusible alloy within the mold and band and subsequently fitting a metallic crown and shell over the shape thus formed.

BOTTLE STOPPER.—C. J. Malone, Sacramento, Cal. No. 590,791. Dated Sept. 28, 1897. This invention relates to a device for hermetically closing bottles for the purpose of preventing the surreptitious refilling of such bottles after they have been emptied. It consists essentially in the employment of a peculiarly shaped yielding stopper in conjunction with an exterior glass stopper, the corresponding inclined faces fitting together, and a means for locking the two in place. The bottle neck is provided with a frangible section which when broken allows the outer glass stopper to be removed and exposes the inner one so that it can be removed in the ordinary manner.

GAS ENGINE.—A. J. Tackle, Oakland, Cal. No. 590,796. Dated Sept. 28, 1897. The object of this invention is to provide certain improvements in regulating the supply of explosive gas to engines of that class and in a novel means for igniting each charge so as to explode it at the proper time. It consists of a spring pressed normally closed inlet valves having heads upon the outer ends of their stems with wedge-shaped slides movable in contact therewith and at right angles with their line of movement and connections with a governor whose safety is dependent upon that of the engine, so that the slides are moved to increase or decrease the opening of the valve. The valve stems are prevented from turning by shaping them to fit the parts through which they pass. The igniting device consists of a stem slidable through a collar having a globular rounded head and a flat wiping plate fixed to a rotatable shaft turning at right angles so as to make contact with the curved surface of the globular head, thus making a perfect contact and maintaining it under any condition of wear.

PROCESS OF TREATING REBELLIOUS ORES.—Wilfred L. Brown, San Francisco, Cal. No. 590,801. Dated Sept 28, 1897. This invention relates to a process for treating rebellious ores. It consists essentially in adding a suitable compound to the finer pulverized ore, this compound containing an element which has a chemical affinity for the base constituents of the ore, then passing an electric current through the material to unite this element chemically with the base constituents and liberate the precious metals and then circulating the material over an amalgamated surface not in the electrical circuit, and finally returning the material again through the field of electrolytic action, thus continuing for any desired length of time.

CONCENTRATOR.—George Gates, Jackson, Cal. No. 590,789. Dated Sept. 28, 1897. This invention relates to improvements in endless traveling belt concentrators in which the belt travels over drums at each end of the machine. The belt has parallel endless grooves or channels formed on the surface and upwardly turned edge flanges, one edge of the belt being slightly lower than the other. A feed trough or hopper extends parallel with the upper edge of the belt and distributes the pulp upon the belt, the valves being employed to control said openings and a means for distributing the pulp upon the higher edge of the belt. Means are provided for increasing or decreasing the speed at which the belt and connected parts travel, and means for connecting the power and transmitting shafts whereby an oscillation of one part is permitted without affecting the movements of the other.

The SCIENTIFIC PRESS PATENT AGENCY herewith presents an engraving of a new concentrator invented by A. C. Springer of this city, and for which it has recently obtained a patent. A large number of these machines have been built, and are in successful use at various points from Alaska to Mexico. The following are among the many advantages claimed for this concentrator: It will do more and cleaner work than any rubber belt machine; it weighs only one-half as much as some of the other 6-foot concentrators; is the most simple in its construction of any machine in the market and only one-third as many pieces in it as in some of the others; was invented by an old miner of many years experience handling every known concentrator on the market; should any piece need repairing, it can be removed without disturbing any other part of the machine; can be set up by any inexperienced miner; its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt; grade of shaking frame can be changed while the machine is running at full speed; it is the strongest, lightest running, and most inexpensive to keep in repair, of any; will save more of the fine slimes than any other machine; is cheaper than any other 6-foot machine, costing only $350, f. o. b. cars or boat, San Francisco; will handle the pulp from five stamps better than any other concentrator; has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute; the belt is very durable, being made of No. 3 canvas, woven especially for the Springer Concentrator; machine requires so little attention, that one man will easily attend to a dozen of them; it has a solid rubber flange, which no other canvas belt has; wear and tear upon this machine is not one-third as much as upon some of the other concentrators. *

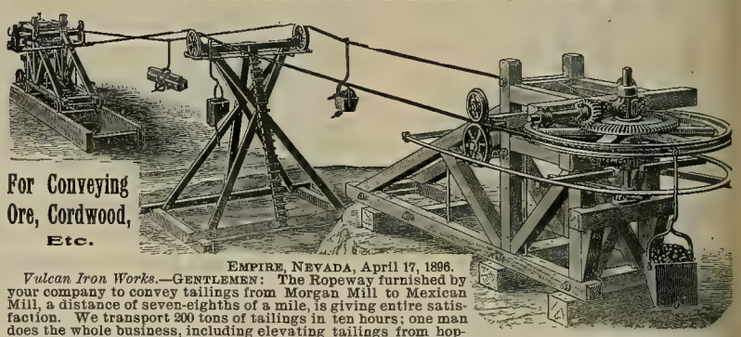
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 7, 1897.

Business was slightly interfered with the past week by the Jewish holiday; but, with this out of the way, it is expected there will be quite an increase in the volume of goods going out. It is noteworthy that, notwithstanding freer purchases by distributors, the stock carried by them is kept down, owing to an enlarged consumption by reason of non-wage earners being given employment, particularly in the agricultural and mining districts. It has been several seasons since so many hands found employment on the farms and orchards. Not only have more hands been given employment, but a better wage paid. In the manufacturing industry more hands have been at work, particularly in the textile clothing and furnishing goods. The extraordinary heavy shipments of California products Eastward attests the improved conditions here. It is said that these shipments have made a scarcity of cars.

The local money market is practically unchanged. The free marketing of farm products has caused the supply of available funds in this city to keep quite large, owing to remittances by interior merchants to jobbers here. There is very little inquiry for accommodation, and that little is readily met if approved securities are given. Country property is not sought by lenders. Probably not within the history of this State have so many farm mortgages been cancelled or else largely reduced as there have been within the past three months. This speaks well for the future. At the East there is very little change to report in the money market. The demand from the South for cotton moving continues free, but the free marketing of grain, etc., in the central States has operated against anything like a stringency in Chicago, Milwaukee and other large grain handling centers. There are all kinds of rumors afloat at the East regarding the importation of gold from Europe. It is said that liberal selling of American securities by English and other European investors is against gold importing at present. This selling is done largely for the purpose of investing in Argentina securities owing to their relative cheapness in view of very large crops.

The City of Peking took out a treasure list of $390,319, consisting of 249,814 in Mexican dollars, $2935 in gold coin and $124,400 in silver bullion, and $13,170 in silver soles.

New York Silver Prices.

NEW YORK, Oct. 7.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26	55⅞
Saturday	26¼	56⅛
Monday	25⅞	55¾
Tuesday	25	55
Wednesday	25¼	55¼
Thursday	26	56

	Copper.	Lead.	Iron.	Tin.
Fri.	11 10 @11 30	4 35	10 00@12 25	13 65
Sat.	11 10 @11 30	4 30	10 00@12 25	13 65
Mon.	11 15 @11 30	4 25	10 00@12 25	13 70
Tue.	11 10 @11 32½	4 25	10 00@12 25	13 67½
Wed.	11 10 @11 32½	4 17½	10 00@12 25	13 67½
Thur.	11 10 @11 32½	4 17½	10 00@12 25	13 65

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.83½
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	56
Mexican Dollars nominal	45@46

SILVER.—The market shaded off slightly, but toward the close it began to recover, closing strong. It looks to us as if the markets at the East and abroad are being manipulated in the interest of buyers. It is a well-known fact that several large countries are making liberal purchases of silver for mining purposes to replace silver coins in circulation which are badly worn. It is also known that the revival in business in Europe developed the fact that two or three of the countries did not have a sufficient supply of silver for commercial purposes. The conviction grows with the better-informed that there will be held in 1898 an international monetary convention to discuss and, if possible, devise ways and means looking to international bimetallism.

MEXICAN DOLLARS.—The market is steady to firm with a continued free buying for export. The stiffening in silver also induces buying.

COPPER.—The market is quiet but firm. At the East the domestic demand is only fair, but for export it is quite large. In their Liverpool circular James Lewis & Son report as follows: "The somewhat unexpected demand which has arisen for sulphate of copper has considerably increased the deliveries of Chili bars from the public stocks, which have diminished 479 tons to Sept. 16, and sales of high-conductivity copper have been made for shipment to the Continent. The sales are estimated to amount to fully 12,000 tons for forward delivery, chiefly for Italy; £17 per ton has been freely paid for delivery next year, and £17 5s is now generally asked. The shipments to Sept. 1st amount to 49,200 tons, against 45,988 tons in the same period last year.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—The market is steady. Shipments by water the past week were 100 flasks to Mexico and 4 flasks to Victoria, B. C.

Our market is quoted at $38 for domestic consumption.

LEAD.—The market is easier but not quotably lower, although it is stated that concessions are obtainable by large buyers.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00 @ 5 25
Sheet	6 25 @ 6 50
Pipe	5 50 @ 6 00

TIN.—The market is practically unchanged. Last week's remarks will cover this week's reports.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady with a good call reported.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The demand is good with no change in quotations.

COAL.—The market is reported unchanged. The consumption of steam shows an increase of fully 10 per cent over last year at this time. The demand for domestic is increasing.

IRON.—The market is firm for both American and foreign. The East reports active markets, with a large increased consumption.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

In our market there is nothing new to report. The demand is fair at unchanged prices. A cargo of nitrate of soda came in this week. It was sold for shipment to this port. The East reports nitrate of soda easier but crude bluestone higher, with no change in anything else.

SULPHURIC ACID.—The demand is fair. We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported easy from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady. We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady. We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady. Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is good for export. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm. We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady. Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Oct. 7, 1897.

Trading has been quite active the past week with cross orders still in evidence, but not to so large an extent as at the commencement of the present upmove, or, as some call it, brokers' deal. The lead shifted from Crown Point to Belcher, owing to reporting a discovery of ore in the former, causing the majority of shorts to fill, and it also brought in many gudgeons who swallow any kind of story put out by the manipulator through tools and cappers. Belcher being somewhat problematic as far as regards ore was jumped on by short sellers after the Crown Point jump of last week, and as a consequence the more timid have been made to fill on the jump of Wednesday, but the larger ones have not, so far as we can learn, filled, owing to a belief that the ore strike in Crown Point was exaggerated and that it will not be found to be any better in Belcher. While the market looks as if it will, under manipulation, go higher, yet outsiders should exercise caution and not be left loaded up with shares, for from all that can be learned there is nothing of a legitimate character to cause higher prices, and when they are advanced above the value of ore in sight and a fair percentage for further developments, then the market is dangerous, and it is much safer to be out than in. The flurry in the market has brought in more operators from the outside who, like flies swarming around molasses, can not resist the temptation to try and make a "big killing" within a few days—but the big killing nearly always is on the wrong side for them. While the writer does not see or hear of anything to cause dealers to go wild over the situation, yet there is no telling what may be found, for there is active exploiting work in several which may lead up to the finding of more ore in one or two of the mines than has, as yet, been reported by officials.

From the Comstock mines both private and public advices report a fair degree of activity in nearly all. The flurry in the share market gives officials more encouragement that money will be forthcoming through assessments for more work than has been done for fully one year. The advance in prices has allowed the selling by several companies of treasury shares. In some instances the number of shares went into the thousands. This not only helps to fill the exchequer, but it also gives assurance that one or more assessments will be paid by outsiders. In Alta the work is being pushed with a fair degree of activity, with the formation said to show an improvement. In Justice they are getting ready for more active exploiting. The management express themselves very hopeful, which will not be changed so long as a large quantity of shares are held by them. Caledonia has levied a 10-cent assessment, which will admit of starting work. From Overman no change is reported in the work or quantity of ore extracted. Some ore is being raised by Seg. Belcher, as there is by Belcher. From the latter mine it is reported on the street that there is an improvement, and the outlook is very promising for finding something better than was found in Crown Point. It is rumored that there is an improvement in Crown Point, but the official letter does not give it, although it reports favorable work. Kentuck, it is stated in official letters, has taken up the crossdrift and is running it in its own ground.

News from Yellow Jacket is hard to get, but it is stated that important work has either been started or is to be very soon. From Confidence and Challenge nothing new comes to hand. In Con. Imperial they are crossdrifting on the surface level, while running jointly with Confidence and Challenge a west crossdrift. They are still fooling around the 500-foot level in Alpha. There are favorable reports on the streets from Bullion, but we fail to have them verified. They have made air connection in Potosi, which admits of better exploiting work. They save a few tons of pay ore each day. In Chollar air connection and other repairs are being made on the 450-foot level and in the main incline above and below the 1100-foot level. No work in Hale & Norcross. The work reported in Savage is about the same as has been under way for some time past. They expect to commence extracting the 1000 tons of low-grade ore in Gould & Curry within the next ten or fifteen days. The Gould & Curry and Best & Belcher joint east crossdrift has been turned into the latter's ground, so that company takes full charge of it. Active work, but with no good results as yet, is being done in Con. Virginia on the 1550-foot, 1650-foot and 1750-foot levels. No ore is being extracted. The Kinkead Milling Company has purchased the remainder of the 700 tons of low-grade ore, paying $2 a ton for it. In Ophir they are running west on the 1000-foot and Central tunnel levels. They are still running an east crossdrift on the 1000-foot level of Mexican. In Union they are also running east on the 900-foot level. In Sierra Nevada the west crossdrift on the 900-foot level was at last advices in favorable ground, with a seepage of water coming in. There is no change in the work on the Layton tunnel level, so far as official letters go. They are still crossdrifting west in Utah. They are drifting north in Andes on the 175-foot level.

From the Brunswick lode our advices are practically unchanged so far as work is being done in Occidental, Chollar, Savage, Gould & Curry and Best & Belcher. The work in the first two is being pushed quite energetically, as it is in Gould & Curry. They are about ready to open up the 300-foot level in the latter mine, while in Chollar, and also in Occidental, they will start within a short time several crossdrifts on the levels reported last week. Good results are looked for on these crossdrifts.

The market opened this morning active at a decided decline for the Gold Hill shares on yesterday's prices. Belcher, which sold up to $2.15 yesterday, closing at $1.50, sold down to 90 cents this morning. Crown Point and Yellow Jacket broke also, the former 50 per cent and the latter 30 per cent below the highest prices yesterday. The middle and north-end shares only went off about 10 per cent. The market acts very much as if it will move to much higher figures, and the sharp ups and downs are preliminary to it, but before it gets well under way again it may sell slightly lower. What will be taken up next it is hard to say now. The up in Belcher was a report of an ore strike in the upraise and the break on reports of its being a failure. These reports can be taken for what they are worth, for they are put out for a purpose. They will find ore in Belcher when they want to, and high grade, too.

The following illustrates the changes of the week:

Mines.	Sept. 30.	Oct. 7.
Alpha	$ 22	$ 21
Alta Consolidated	12	23

Denver M. Co., San Diego; capital stock, $1,000,000; $1000 subscribed.

Centipede M. Co., Los Angeles; H. B. Ellis, A. W. Davis, L. G. Parker, F. D. Bullard, Z. T. Cole; capital stock, $500,000; all subscribed.

Gold Standard Hydraulic M. Co., San Francisco; S. Klein, W. J. Bevan, A. F. Collins, A. D. Allan; capital stock, $100,000; $50 subscribed.

Assessment Notices.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of Septemb r, 1897, an assessment (No. 7) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 36, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of October, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 8th day of November, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office—Room 36, No. 309 Montgomery street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 28th day of September, 1897, an assessment (No. 8) of 4 per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 44 Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44 Phelan Building, San Francisco, California.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

Assaying Gold
.....AND.....
Silver Ores.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Recently Declared Mining Dividends.

Pennsylvania M. Co., Grass Valley, Cal., No. 10, 5 cents per share, $5150; payable immediately.

Morning Star M. Co., Colfax, Cal., No. 82, $8 per share; $19,200.

Dutch Mine, Calaveras Co., Cal., No. 3, 5 cents per share, $7500; payable immediately.

The Standard Consolidated Mining Co. of Bodie, Cal., 10 cents per share, $20,000; payable October 20th—a total of $3,757,868 to date.

Swansea, Utah, $5000; payable Oct. 9.

Le Roi, B. C., $50,000; payable immediately—a total of $625,000.

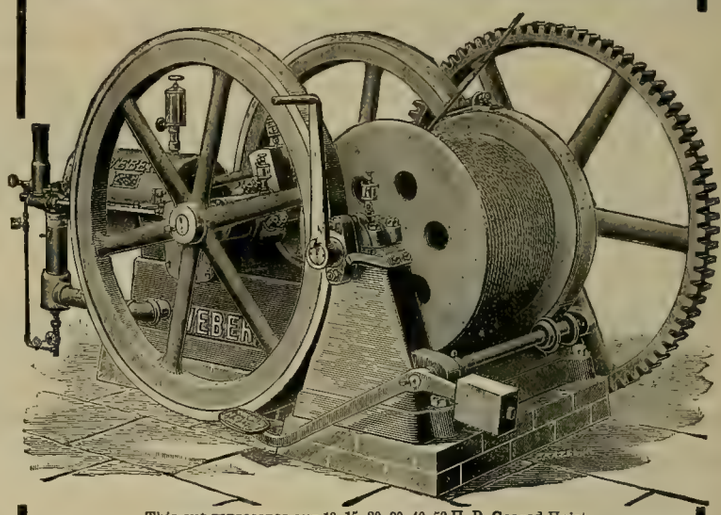
ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

WEBER GASOLINE HOISTING ENGINE

MONEY SAVERS

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.



This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

We also build **Single and Double Drum** Hoisting Engines, both **Geared or Friction**, and furnish Wire Rope, Ore Buckets, Cars, Shives, etc., making complete outfits. "Weber" Hoisters and Engines use **Gasoline, Naptha, Distillate, etc**, for fuel. They can be used **Underground** or on the dump. **Altitude** makes no difference in the operating of the "Weber."

SAFE, STIFF, STRONG.

Every Engine sold on an Absolute Guarantee. In use for all purposes. Used by such concerns as K. C. Consolidated Smelting & Refining Co., Philadelphia Smelting Co., Guggenheims, etc.

For prices and particulars, write us, stating duty required, Horse Power, etc. Catalogues, "Stationary" and "Hoisting" on application to

WEBER GAS AND GASOLINE ENGINE CO. 430 S. W. Boulevard.

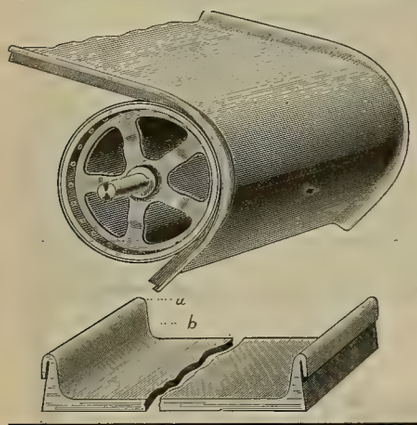
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared or coating all sizes of Pipes with Asphaltum.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY,
Per G. M. WILDE, Acting Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Sts., San Francisco.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,
D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager,
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. McIVER, President; D. CUSHMAN, Secretary,
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

THE HALLIDIE ROPEWAY

Stands pre-eminent for the transportation of Ore, Fuel and other materials over mountainous and rugged country.

Parties desiring to remove large quantities of Sand, Gravel, Earth, Ore, Rock, to construct Dams, Levees or Embankments, etc., can do more efficient work at less cost by the

Hallidie System of Ropeway Transportation

Mining Machinery & Supplies.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake [illegible], Utah (one furnace); The Metallic Extraction Co., Cyanide, Col[illegible] furnace); The Colorado-Philadelphia Reduction Co., Colorado C[illegible] (three furnaces); The Selby Smelting & Lead Co., Selby, Cal., (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

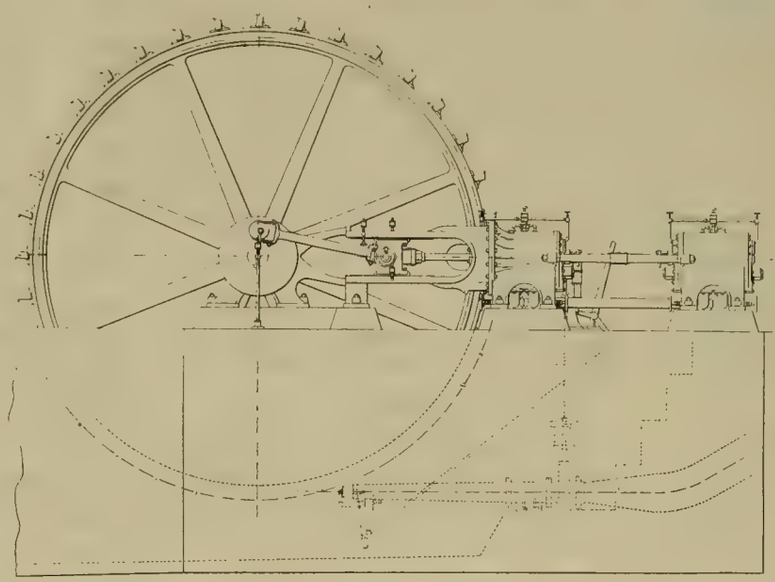
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1945.— VOLUME LXXV. Number 16. SAN FRANCISCO, SATURDAY, OCTOBER 16, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Direct Connected Air Compressor.

Herewith is shown a cut of a 500 H. P. air compressor, with direct connected Pelton water-wheel, recently furnished to the Gwin mine, Calaveras Co., Cal., by the Rix Engineering and Supply Co. The air cylinders are 18x24—four in number. The water-wheel is 19 feet in diameter and operated under a head of 420 feet. The compressor is one of the latest design, operates at 80 revolutions and furnishes air at 90 pounds pressure. This air is conducted a mile and a quarter and will be used by the Gwin Company in running a double 10-inch hoister on the surface and also for pumping out the old Gwin shaft to the depth of 1500 feet. This pumping will be done by compound pumps and will be done in three stages.

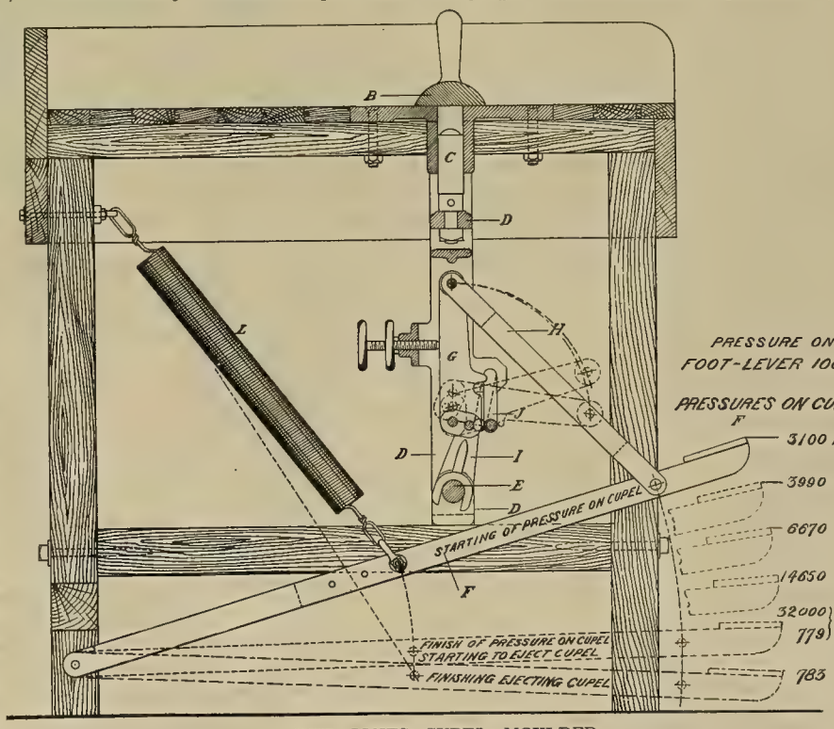


DIRECT CONNECTED AIR COMPRESSOR.

This plant is situated on the Mokelumne river, 420 feet vertically below the 40-stamp mill running at the mine. The water which is used to drive the mill and hoisting works is carried through a 15-inch pipe 4500 feet to the river and there used upon the wheel, so this water furnishes power for the second time at practically the same head. A plant similar to this, but smaller, has been recently placed in operation at the Black Oak mine, Tuolumne county, operating under a similar head of water, using a 14-foot direct connected wheel. The compressor is making 100 revolutions and is meant for the operation of six rock drills. Incidentally, the plant furnishes air to the cyanide plant and also to run a small hoister.

The Jones Cupel Moulder.

Assayers and others will be interested in the new patent cupel moulder illustrated herewith. The old way of making cupels by hand is not wholly satisfactory, the texture of the bone ash being ofttimes destroyed by the successive blows of the mallet. Some are large, some are small, some are hard, others soft, the edges are rough and imperfect and cracks sometimes appearing, rendering them useless. To get satisfactory work by the hand process considerable skill is required to give just the right density and have them all alike. In the new moulder the cupels are formed by a steady, continuous and increasing pressure, applied by the foot through the medium of a system of levers and toggles so arranged that the pressure is gradually increased as the increasing density of the bone ash requires. A heavy final pressure is thus secured without additional effort on the part of the operator. When the compression is completed the leverage is automatically changed and the finished cupels are expelled (two or four at a time) with a slight pressure and movement of the foot. Every cupel is the same size and density, they present a good appearance, and are less likely to crack in drying. The manufacturers claim that with this machine a boy can make from 250 to 300 cupels per hour. The exclusive right to the manufacture and sale of the Jones cupel moulder, under the United States and foreign patents, has been granted by the inventor to the Parke & Lacy Co., San Francisco.



THE JONES CUPEL MOULDER.

River Improvement.

Regarding the river improvement—upon which considerable has been said in and out of these columns—it is to be observed that the half million dollar joint appropriation, which is under the direct supervision of the United States Debris Commission, will suffer no depletion this year. It is the opinion of the United States Debris Commission that preliminary surveying and determination of the point at which operations shall begin may occupy all the present available season. It appears to be now a question of choice between De Guerre Point and the Narrows as to where the restraining dam shall be built.

The Federal government in these affairs moves slowly and doubtless wisely. It cannot be said in regard to this matter that any rash or hasty inception of work will ensue. As to the expenditure of the $300,000 State appropriation for dredging, etc., some of the many attaches of the State public works department are still engaged in surveying and reviewing and reporting; and doubtless after some of these surveys and reviews and reports are published some estimates of the probable cost of dredging and the possible cost of jetty construction will be in order. Then there are also possibilities of surveys and estimated costs of easements, and, in general, the whole work of how not to do it may be considered in a favorable state of progress.

THE canal, 160 feet wide and twenty-eight miles long, from the south branch of the Chicago river to Lockport on the Desplaines, will be completed this year, at a cost of $30,000,000. Over twenty-six million cubic feet of glacial drift and nearly twelve million cubic feet of solid rock have been excavated and removed; in addition to this, the work of making a diversion channel for the Desplaines river to carry off its waters in great freshets. Three hundred thousand cubic feet of water a minute will flow from Lake Michigan through this new river. The boldness and novelty of the specially constructed machines to handle the material was noticeable. The great cantilever crane—a bridge 600 feet long spanning the channel and extending far on each side, and carrying endless belt pans in which the rock was loaded—was noteworthy. It was mounted on trucks so that it could be moved parallel with the channel.

An Imperative Necessity.

Every collection of miners, large or small, when in consultation, now agree that there should be an additional departmental officer in the national Cabinet—the Secretary of Mines and Mining. The idea is steadily growing in popular favor; its justice is conceded and public sentiment favors the idea. The tremendous impetus given to the industry of mining in the last few years has hastened the time when such a move will be consummated, and the growing importance of the mining industry of the nation justly demands such recognition. At the risk of repetition it may be said that for several years the MINING AND SCIENTIFIC PRESS has favored the creation of a new department in the Cabinet—a Secretary of Mines and Mining—and the increased interest in the mining industry throughout this west half of the nation in the past four years has renewed the hope of realization of miners' requirements. The hard deal that the miners had been getting at the hands of arrogant and ignorant department heads is of itself sufficient reason for the establishment of a Bureau of Mines—the creation of a Cabinet officer whose sole business it shall be to attend to that great industry. With no more than passing reference to the dignity of the mining profession, or to the fact that upon the prosperity of the mineral industry primarily rests the prosperity of any country, it is but necessary to cite the present value and extent of the mining industries of this nation and their increase. The total value of the mineral and metal production of the United States for the year 1894 was $581,211,258; for 1895 it aggregated $678,001,934; for 1896 nearly $725,000,000; for the present year nearly $800,000,000. An industry that represents an annual output of the value shown by these figures, and an investment of nearly four times that amount, can justly demand the recognition asked.

It has been said that we as a nation have too many departments and secretaries now. As our Government is constituted, it is necessarily a part of governmental functions that the affairs of the country shall be administered by a Presidential Cabinet, and it is in order for the miners of California, of the coast and of the entire nation to recognize this fact and unite in a manful request for just recognition. It is by and through Cabinet officers that justice is secured and interests fostered, and it is the way those things will be done. The creation of a Cabinet officer to be known as the Secretary of Mines and Mining is in direct line with the policy and outgrowth that has made the Cabinet. At first the Cabinet of the President of the United States was composed only of a Secretary of State, a Secretary of War and a Secretary of the Navy. As the country's growth required, there have been added, successively, a Secretary of the Interior, an Attorney-General, a Postmaster-General and a Secretary of Agriculture. In the order of evolution of development, the time has now arrived for a Secretary of Mines and Mining.

Any intelligent man in or out of the mining business who will note the trend of affairs during the past decade will be likely to give affirmative echo to the statement that the creation of a Cabinet officer, to have charge of the country's mining industries, is not only of immediate necessity to the miner, but of pressing importance to the interests of the nation in its entirety. This great mining industry is, so far as Government charge is concerned, a little dump in the corner of the office of the Secretary of the Interior. The ignorance displayed by that department has been lamentable. With no disposition to find fault or to blame, with the most merciful standard of criticism, it is to be said that, as at present constituted, the only Cabinet connection this Government had with its greatest basic industry for the four years preceding May, '97, had been a prejudiced subordinate official in the Land Department, who, left to his own devices and questions of personal privilege, allowed unworthy influence to govern his actions, and who made absurd and injurious rulings, in ignorance or defiance of the plainest requirements of the mining public. This man and his attendant satellites knew nothing of mining. It was not their fault, but inured to our misfortune.

The common experience has been that every day came up a point involving interpretation of the mining laws of the United States. A letter to the Secretary of the Interior brought a construction or ruling on a disputed point, and a letter to the Commissioner of the General Land Office elicited a ruling or decision on the same point exactly opposite to that of his superior. Were the matter pushed, or the divergence of opinion pointed out, the impression was conveyed in subsequent official correspondence that the miner is a nuisance, always bothering and disturbing official ease. With the present Secretary of the Interior and Commissioner of the General Land Office matters are more justly and intelligently managed; but we need a new department of the Federal Government—the Department of Mines and Mining—with a competent man in charge as a Cabinet officer of equal standing with the other members of the Cabinet. It is of little consequence whether he hails from California or Colorado or North Carolina, so that he has sufficient knowledge and authority to correctly conserve the mining interests and administer the great affairs with which his office would be charged. There are a great many things in the mining world that need straightening out, and they never will receive due attention or proper solution till there is a Cabinet officer of mines and mining. It is hard enough at best for the miners of this country without having things made harder still. Between the grab of the corporations and the merciless ignorance of those occasionally in power the miner has had little show for justice. If the miners of this country (and that term is meant to include every one directly connected with the mining industry) will work together in a united demand for such recognition as that originally suggested by the MINING AND SCIENTIFIC PRESS—a Cabinet department for the Government and fostering of the mining industry—it will be forthcoming.

The United States Government has done less for mining than for any other industry. There is not to-day to be found in Washington, D. C., even a single clerk to represent that great industry. The miners do not ask that the Government in this matter render any assistance to mining; only that it awaken to present requirements and assist itself. All the miners ask is that such action be taken as will decrease rather than increase the expenses of the Government. The Geological Survey, aside from its educational value, is of little use to any industry except mining, and that is under the Treasury Department. So with other bureaus that miners have to do with. Anything that affects the miner is in a detached condition under the heads of different departments that are not in active sympathy with or interested in practical mining work.

The miners are the cause and primary factor in the building up of the country westward from the 104th meridian. But for them this whole region would not be even so far developed, and the other great industries of this part of the nation would be but little advanced to-day from their rudimentary condition in the early '50s. A sense of gratitude should induce the United States Government to grant such a request as that embodied in the resolution unanimously endorsed at the Nov. '96 convention of the California State Miners' Association, and which will doubtless be re-adopted next Monday. The miners have contributed more to the wealth of the country and done more toward its development, with less return, than any other class of people. They have gone ahead as pioneers, asking no aid nor subsidies, and to-day we pass in palace cars across the way they blazoned white with their bones. Nor do they ask for any assistance. They do not appear as beggars; but without trespassing upon any of the prerogatives of other industries they with dignity suggest to the Federal Government what the business requirements of the time demand.

Our country leads in many important respects, yet in this we are behind other civilized nations. In Great Britain, France, Russia and Germany, with less reason than in ours, are Government departments of mining, ministers of mines, whose business it is to look out for that industry, and the effects of such governmental supervision are too manifest to require more than allusion.

It is the duty of the Government to see that the great sources of national wealth are not wasted. Yet the United States Government has been almost criminally negligent in this respect. Countless millions have been irretrievably lost in mining enterprises by reason of such neglect. At a comparatively small national cost for gathering information and supplying it to miners, securing modification and adjustment of conflicting laws, much of this loss could be prevented.

The horizon of the future widens. It is manifest that however deferred this matter may be it must come. Nothing is ever settled till it is settled right. The task is not an easy one. It will take concerted effort, unity of interests, a combination of forces East and West, education of the public mind, favorable consideration of officials in and out of Congress, and a general realization of the justice of the proposed measures. Miners can secure favorable public opinion and show cause for maintaining this idea and practical reason for its fulfillment. It is the province and should be the purpose of the convention that meets in this city next Monday to do more than merely pass perfunctory resolutions favoring the idea. An active committee should be appointed to influence public sentiment, bring the matter to the attention of Congress, and get every Representative and Senator to fully realize that this is an imperative necessity.

The Wedderburn Disbarment.

A brief notice was made last week of a recent decision of the Commissioner of Patents, in the case of a firm of patent attorneys in Washington, who have after a long trial been convicted of fraudulent practices, and have by this decision been debarred from further practice before the department. The testimony showed that the firm referred to was guilty of grossly unprofessional conduct. The report of the assistant Commissioner says: "The facts brought out in the record show that the firm of Wedderburn Co. carried out in their practice a skillfully planned scheme of deception, misleading their clients without regards to the dictates of truth, justice or decency. By false high-sounding promises, they played upon the credulity of their clients, and led them on by a misrepresentation and concealment of material facts to send money, using the Patent Office and the business of patent soliciting as an agency to practice their schemes."

The evidence showed that clients were charged for

examinations which were never made, and favorable reports were made upon clearly unpatentable inventions. When the inventor sent his money to apply for a patent, he was usually given a silver medal worth about 25 cents.

"It will be noted," says the Commissioner, "that the name of the genius does not appear on the medal, but that of John Wedderburn & Co. does; nor is the invention mentioned, so that the medal could be worn by a man or a dog with equal propriety, and would serve the same purpose as a cheap advertisement for the respondents.

"But the client, the 'sucker,' as Wedderburn facetiously calls him, is played still further along the line, thus: About the time that the sterling silver medal reaches the supposed inventor, he or she receives a communication without date from the National Recorder, which announces that the Recorder has learned that the party addressed has been placed upon Wedderburn's 'roll of honor,' and has received a 'sterling silver medal' as a 'reward of genius,' and the National Recorder appears to the reader of the letter to be wonderfully wrought up over the discovery of a budding genius of such rare merit, and the Recorder proposes at once to write up, or to have written up, the individual who has won such distinction." This he shows is done for $5.

"And so," the Commissioner continues, "the Recorder comes out with a whole page of the pictures of these credulous and duped mortals who have paid $5 for a boost up the ladder of fame, and the postoffice department of the United States and the patent office were for nearly two years the agents and instrumentalities used for carrying on these schemes, to the disgrace of the Government. And the brilliancy and pecuniary profit of the achievement have hitherto purchased absolute immunity and even favor. If in the future with reference to the respondents or any other company, combine or persons adopting and using such methods (and there are many of them), it will be due to gross neglect of duty on the part of Government officials who are charged with the administration of the law.

"It is well known that the methods and schemes here condemned are becoming common as a result of the supposed immunity the delinquents find in the money they make, and the influence and power the money so obtained will purchase and control. It is proper to say here that as to the practices, methods and conduct under consideration, no matter by whom practiced, we are at the parting of the ways."

The Commissioner recounted that the Wedderburn Company had a nominal capital stock of $100,000—$90,000 of preferred stock and $10,000 of common stock, but the common stock had the control. "This stock," he says, "according to the showing of the respondents, seems to have been carefully placed in the hands of over 3000 newspapers or newspaper men throughout the country, so that the 'plain people' throughout the Union, who reside away from the great commercial marts and highways of commerce and manufacture, could be put in communication with Wedderburn & Co. and be advised touching the great opportunities to make a fortune by little inventions and be induced to believe that they would be advised free of cost as to the patentability of their conceptions and endeavors in the inventive line."

In many of these newspapers the following has been published: "It is a remarkable fact that the firm of John Wedderburn & Co. to-day embraces more than three thousand well-known newspapers, *all of which are stockholders*, and whose *vital interest* it is, not only to spread abroad the fame of this firm, but also to *guarantee to the public* the skill and integrity of its management."

The Commissioner says commenting upon this: "The newspapers now have an opportunity to vindicate the integrity of its management. We will see with what promptness they vindicate."

The assistant Commissioner says of the practice of the business of selling patents:

"The propriety of an attorney or solicitor of patents combining the business of soliciting with that of selling patents is, in my opinion, questionable. Doubtless it may be done honestly, but the respondents' methods are shown to be such as to sell the clients rather than their patents. These respondents, in their pamphlet, 'How to Get a Patent,' on page 31, publish a 'warning' against those concerns which offer to sell patents in language which describes with scrupulous exactness the reprehensible methods which they themselves practiced to deceive their clients, and conveys a correct estimate of the moral quality of their practices."

The decisions of the Commissioner and assistant Commissioner will form a general declaration of what constitutes proper practice before the United States Patent Office, and in that respect are regarded as the most important documents that have ever been issued from the office.

Concentrates.

DURING September, '97, there were milled 21,354 tons ore at the Alaska-Treadwell; during the same period 417 tons sulphurets were treated.

THE Colorado *Chieftain* says some of the lead crystals found in the Rex mine at Hillsboro, N. M., sell for $15 each to New York specimen dealers.

THE Bay Horse mine, Mesquite district, San Diego Co., Cal., gives some evidence of value, as a rival claimant, "the original locator," has appeared.

DURING September, '97, the Chollar Co. disbursed $5367—the largest amount of any mine on the Comstock—next to the Con. Cal. & Va., which expended $7994 50.

BY May 1st, '98, there will be two large and regretful contingents composed of those who are sorry they didn't go to the Klondike and those who are sorry they did.

ALL who claim the title of "mining engineer" are not possessed of the requisite knowledge; though it is to be hoped that the claimant has the capacity to become one.

THE Government of the colony of New Zealand has purchased the MacArthur-Forrest cyanide patents, for the public welfare, subject to the approval of its Parliament, for the sum of $150,000.

THE Northwestern Mining Association, which closed its session at Spokane, Wash., last Saturday, elected G. B. Dennis president, A. P. Curry vice-president, W. J. C. Wakefield treasurer, L. K. Armstrong secretary.

OF the United Verde, Arizona, Copper Company's mines it is locally asserted that "the copper that pours from the immense smelting furnaces is known to be exceeded in value by the gold contained in the bullion and matte."

IN a New York paper appears the advertisement of a firm of perfumers, who offer a share of mining stock for every dollar's worth of goods purchased. The mine is located in Arkansas, and it is announced that the stock sells "at par" $1 per share.

THREE men were instantly killed by an accident in the Homestake mine, Lead, S. D., on the 6th. They had set off two blasts which did not explode. The men went to investigate and the blasts went off. The bodies are buried under a mass of ore 36 feet deep.

THE National Irrigation Congress, which last week concluded its labors at Lincoln, Neb., chose Cheyenne as the next place of meeting and endorsed the Herman bill, now pending in Congress, providing for cession to the States of millions of acres of arid land.

THE hydraulic season in the northern and eastern part of California has not been satisfactory. More than the usual quantity of rain fell last winter, but less than the usual amount of snow, there being thus a scarcity of the usual supply nearly all through the season.

THE Winnipeg, Manitoba, *Free Press* reports a resident of that place "buying black sand at 6 cents a pound." There ought to be enough of that material on the Saskatchewan to create considerable of a local industry at that price, if transportation charges can be arranged.

LAST Saturday an explosion of giant powder occurred in the 600-foot level of the Virtue mine, Baker City, Or., resulting in the death of J. P. Maddox and the injury of several other miners. The cause of the explosion was the dropping of a lighted candle in the powder magazine.

A TRANSACTION in the Flagstaff, Arizona, bank last Saturday shows an interesting phase of the silver question. A Chinese came in with $470 silver and with it bought a silver draft on San Francisco for $1000, to buy 1000 Mexican dollars, as the wily heathen explained, "to be coined into China money."

FROM the best information that can be obtained, an acetylene-gas flame of 30-candle power consumes twenty liters of gas and costs three-fourths of a cent per hour. This contemplates the use of carbide of standard purity and productive power, and, in this respect, the carbides of commerce vary considerably.

R. F. BROWN reports the finding of "a 5-foot ledge" of uranium twelve miles from Peshastin station, on the Great Northern Railway, Wash. It is one of the rare metals, is produced mainly in Austria and Germany, and is worth about 75 cents per gram. The Washington find, if authentic, is probably a silicate.

FOUR-DOLLAR GOLD PIECES turn up occasionally. They are called "stellas" and were coined at the Philadelphia mint about twenty years ago. They each contain 6 grams gold 1000 fine, three parts silver, seven parts copper. There were about 450 struck, and are worth their face value, and a little more as curiosities.

IT is estimated that the gross output from the Cœur d'Alenes this year (from both the silver-lead and gold belts) will reach $15,000,000, of which, approximately, one-third will go for transportation and treatment, one-third for labor, repairs, material and new machinery, and one-third as profits to the mine owners.

REGARDING the appointment of Government employes at different frontier sampling works, the Secretary of the Treasury has ordered the preparation of regulations for the sampling of imported ores, and states that when these regulations are promulgated the question of appointing additional assayers will be considered.

JUST what is "the biggest and most profitable gold mine in America" is not possible to be exactly stated. Probably as big and profitable as any is the El Oro, 100 miles from the City of Mexico, seven-tenths of which are said to be owned by J. B. Haggin and Marcus Daly, the remaining 30% in London. Men who claim to know say it is now paying a net profit of $400,000 per month.

"THE greatest, grandest, richest and best gold prospect in the United States" has at last been definitely located. It is "on the Seine river in Ontario, due north of Duluth;" the Rainy Lake, Minnesota, *Herald* says so. "An English syndicate is going to buy it" for either $700 or $7,000,000. Besides being in the United States and Ontario, the mine's surrounding scenery is also reported to be superb.

THE only suggestion this paper has to make regarding the selection of officers of the California State Miners' Association next Tuesday is to keep out politics, and corporate influence and plans for private gain. These have been guarded against all along, and should be. The Association is not for the furtherance of any one's political hopes, nor is it a place for any one who expects to make anything for himself out of it.

A VANCOUVER, B. C., dispatch says: "The offer of W. H. Remington of Salt Lake City to put up a 300-ton double-stack ore smelter near Vancouver, in consideration of a municipal bonus of $100,000, payable by the city at $1 a ton on the output, has induced the Rothschilds-Evans Syndicate of London, England, to 'go one better' and offer to put up a 350-ton smelter near Vancouver, on the harbor front, if the city will grant a bonus of $65,000, payable at $1 a ton."

IODIDE OF COPPER has been found in the Broken Hill Proprietary mine, New South Wales. The Georgetown, Colorado, *Courier* says this compound has never previously been found. Iodide is found in but few mineral compounds. It occurs with chlorine, bromine and silver in the mineral iodobromite, found near Dernbach, Nassau. With silver it forms the mineral iodyrite, or iodic silver, which is the most abundant of the iodide minerals, and is found in New Mexico, Arizona, Mexico, Chile and Spain. Combined with silver and mercury it forms the mineral tocornalite, found in the mines of Chanarcillo, Chile. With mercury it forms the mineral coccinite, found in Mexico. Iodide of zinc has been found in Silesia, along with other zinc minerals, though not distinguished.

THE Denver *Republican* wants Colorado to beat California's output of gold this year, and says: "Of late we have upon several occasions directed attention to the need of making Colorado's gold output as great as possible this year. It is probable that Colorado will surpass California, but it should do it with figures so great that there would be no room for Californians to dispute the record. Every owner or operator of a gold mine should determine to help make the victory doubly sure. Let Colorado this year go away ahead of California, and public attention in the East and also in Europe will be strongly attracted to the district that makes the best showing." Colorado is making strong efforts in that direction, and Colorado's railroads do all possible to advertise their State. California's railroads seem afraid that some one will find out what the State is doing in mining and never have a line about the leading industry of the State from which they expect support.

WHAT is claimed to be a new precipitation process for cyanide solutions is thus described by the inventor in the London *Mining Journal*: "The principal feature of the Cowper-Coles process is an aluminum cathode, which overcomes one of the chief difficulties appertaining to the economical recovery of gold from weak cyanide solutions by electrolysis. In the Siemens-Halske process lead foil or lead strips are used, the cutting up of which is a tedious matter. If several sheets are cut superimposed the strips cling together, and have to be carefully spread out one by one, so that the surface may be exposed to the solution. A clean-up is made every seven or eight weeks, when the wood frames carrying the lead strips are withdrawn, the lead strips removed and new substituted, the auriferous lead being ultimately melted down and conveyed to a central works to be cupelled. This method is both crude and expensive, the labor of fitting the strips into the frames is considerable, and the consumption of lead is a large item, having been computed by Mr. Von Gernet, at the Worcester mine, at one-tenth of a penny per ton of ore treated. The Cowper-Coles process overcomes these difficulties, aluminum plates being substituted for the lead foil, advantage being taken of the fact that a loose oxide is formed on the surface of the aluminum, which enables the deposited gold to be readily stripped or wiped from the cathodes as pure gold. Gold by this process has been successfully extracted from cyanide solutions, containing only .01 per cent of cyanide of potassium, 2½ dwts. of gold to the ton of solution. The substitution of aluminum for lead foil or strip enables the gold to be obtained as pure gold and also daily returns to be made of the amount of gold recovered.

AS BETWEEN upraising and winzing between levels in metal mines, the former is the cheaper method. Gravity assists in the removal and blasting of the ore. Two men will upraise from 4 to 6 feet in hard rock in a shift in a hole 4x4 feet. The work is much easier on the men, as they have no ore to shovel, while in the winze two men with the aid of two men at a windlass will only sink from 2 to 2½ feet in a shift in fair rock. The serious objection to overhand work is the great danger from falling rock and the liability to guard against it. These upraises or winzes serve several purposes of ventilation, subdivision of the vein and, when mining operations are begun, the upraise is timbered and becomes a chute for the delivery of the ore. In the overhand method of working out a vein, after the levels have been driven and the vein blocked out by the upraises into blocks of 150 feet in length and the width of the vein, then the workable blocks of vein matter are stoped from the upraise both ways for a distance of 75 feet. The miners begin at the upraise and break away a slice as wide as the vein and 6 or 7 feet high. The ore is then picked over and delivered at the level below. After a slice has been removed, the mill hole is timbered, the height of the slice removed, with close-laid, round logs of about 6 inches in diameter. One slice after another is removed until the upper level is reached and the block is exhausted. It is not uncommon in the working of veins which are entirely pay dirt to allow the broken ore to gather in the waste space to such convenient height as will give the miners a footing. The excess is removed, and the whole accumulation is removed as soon as the stope is exhausted. The ore which accumulates in the chute is drawn off as rapidly as circumstances will permit. The chute is never emptied, but is relieved only of the excess. This plan prevents the rolling of the ore down the chute, and so prevents an excessive pulverization of the ore. As rich ore is usually brittle, the loss induced by such pulverization would be great.

The Cyanide Process.*

NUMBER III.—CONCLUDED.

Francis L. Bosqui, Bodie, Cal.:—Ever since the cyanide process was found to be an efficient means of gold extraction, efforts have been made to supplant the original zinc precipitation method by something "cheaper," "more thorough" and "less inconvenient," in practice. Grave objections have been urged against this mode of precipitation by nearly all writers on the subject, and very recently by Prof. Christy, in his excellent paper on "The Solution and Precipitation of Cyanide of Gold."

The readers of that paper will be chiefly interested in the author's account of his own method of precipitating gold by means of cuprous salts, and in the procedure which he suggests for the recovery of cyanide from strong solutions. While the discovery of this method is unquestionably a very great advance in the chemistry of the cyanide process, it can not, in all cases, be assumed to possess the practical advantages over the filiform-zinc and electrolytic methods, which the author claims for it.

Prof. Christy's four main objections to zinc precipitation are all, with one exception, unqualified. He dismisses the first three as "having been sufficiently emphasized by everyone who has described the practical application of the cyanide process." The fourth he qualifies thus: "4. The failure, in certain cases, to precipitate the gold." It may be safely inferred here, I think, that Prof. Christy means his first three objections to be taken as universal.

It will be of some importance to those interested in the practical development of the process to know that these objections are not universally tenable; and that, notably in cyanide practice at Bodie, California, a pretty exhaustive experience of two years almost completely refutes them.

At Bodie the cyanide process has been very successfully operated for two seasons of about eight months each. During the summer and fall there are five plants in actual operation, whose capacities range from 900 to 4000 tons per month; the total capacity of all the plants in the camp being about 11,500 tons per month. These plants are operated on the same general principle, zinc precipitation being used in all.

The tailings are derived from new accumulations impounded as they run from the mill batteries, and from old isolated beds in the neighborhood of the town, which have been spared by spring freshets in the long mining history of the camp.

No attempt has been made to keep a record of cost of treatment in all these plants. But such a record has been kept on a total run of 52,665 tons; and to this I shall refer in attempting to show that we have not been embarrassed to any extent in Bodie by the disadvantages which Prof. Christy claims for the zinc precipitation method. I assume, of course, that all the tailings in Bodie are of about the same general character as those of which a record of treatment has been preserved, and that, approximately, the same results have been obtained from all.

I shall take up Prof. Christy's objections in the order in which they appear in his paper.

"1. *The great consumption of zinc compared with the amount of gold precipitated.*"

The record of zinc used at Bodie in the treatment of 52,665 tons of tailings indicates a consumption of 0.22 pound per ton, at a cost of about 3 cents per ton; assuming the price of sheet zinc laid down in Bodie to be 9.3 cents per pound, and the cost of cutting it about 4 cents per pound. To be more pertinent, there is a consumption of 1.39 pounds of zinc at a cost of 18.4 cents, per ounce of gold recovered. Theoretically, this consumption is enormous, for it should require only about one pound of zinc to precipitate six pounds of gold; but economically it is very small, since it means a cost of only 3 cents to the ton of tailings.

"2. *The great destruction of potassium cyanide to no useful purpose.*"

It has often been contended that zinc precipitation calls for the use of stronger solutions than might otherwise be resorted to. Prof. Christy stoutly claims for his, and for the electrolytic method, the one paramount advantage that they admit of the use of very dilute solutions of potassium cyanide. At Bodie exhaustive experimental tests were made by Mr. B. W. Merrill to determine the proper strength for a cyanide solution, *i. e.*, with respect to its extracting power on Bodie tailings; and the conclusion was reached that a solution containing less than 0.1 per cent cyanide was not so available as a stronger one. The fact, then, that solutions containing less than 0.2 per cent cyanide were found unavailable for the best extraction in Bodie, would nullify the chief advantage claimed for both the newer methods of precipitation, at least so far as this particular camp is concerned.

We know that, theoretically, there is a consumption of cyanide during precipitation—that is, during the flow of solution through the zinc boxes. Some writers have laid particular stress upon this, as being one great source of cyanide consumption. I have often tried to determine just what this consumption is by making comparative titration tests on a solution flowing into and a solution flowing from the same zinc box, the two samples being taken at the proper interval of time. I am aware that the reliability of the silver-nitrate test, as a delicate method of determining the amount of cyanide present in a given solution, has been called into question. But even assuming that the presence of zinc in the solution does vitiate the test to a certain extent, it is hardly probable that the amount of zinc accumulated during a single flow through a zinc box would be sufficient to destroy the validity of a comparative test. In fact, the quantity of zinc present in eighty tons of strong solution, determined quantitatively at the end of one of our first season's run, was so infinitesimal as to preclude any such conclusion.

There is still another reason for supposing a comparative silver-nitrate test on in-going and out-going solutions to be reliable, namely, the remarkable coincidence that in each case the well known precipitate came down at precisely the same point in the two test tubes. In other words, the density of the precipitate was exactly the same in the two tubes, when a common point was reached on the burette. This would hardly occur with such invariable precision if the test on out-going solution were really vitiated by the presence of zinc accumulated during a single flow through a box.

The silver-nitrate test is a very simple and serviceable one, and, so far as I know, has been generally retained in practice. Even if it be, in the long run, somewhat vitiated by the presence of zinc in the solutions, it still indicates what might be called a "dissolving strength," and, therefore, for all practical purposes, efficient.

The amount of cyanide present in our strong-solution sumps average from 0.14 to 0.16 per cent. As there is no perceptible consumption of cyanide in the zinc boxes, it is safe to assume that this deterioration of strong solution is due to the action of "cyanicides" during leaching, and to its dilution by the original moisture in the tailings and by the final wash-water.

All solutions containing more than 0.1 per cent of KCy are run directly into a "strong-gold tank;" those containing less, into a "weak-gold tank." The excess of this weaker solution over and above what is used in the preliminary leaching is run through a series of "waste zinc boxes," and then to waste. This waste solution averages in strength about 0.05 per cent KCy. There are approximately fourteen tons of it run to waste in twenty-four hours. This may look like an enormous consumption of cyanide, but the system, on close examination, will be seen to have one great advantage. It prevents an excessive and unwieldly accumulation of strong solution, while the amount of cyanide in the waste is really small, in comparison with what would be required to raise it all to standard strength. This accumulation of weak solution is unavoidable where there is an abundance of water available for wash-water, and where practically all the cyanide solution in a vat of tailings is displaced before sluicing.

The consumption of cyanide at Bodie on a total run of 52,665 tons of tailings was 0.41 pound per ton; on the first 41,730 tons it was 0.38 pound per ton. The latter figures represent a treatment of seventy-eight tons per day for a period of 535 days. From these data we might indicate approximately just what the consumption of cyanide is in each stage of the process. On a daily treatment of seventy-eight tons the consumption was thirty pounds. The loss of cyanide in spent solution (assuming that fourteen tons per day go to waste, containing 0.05 per cent of KCy) is about fourteen pounds. This leaves sixteen pounds per day still to be accounted for. It was ascertained by tests made in percolators on average samples of tailings treated that the loss of cyanide in actual leaching is about 0.2 pound per ton, or 15.6 pounds per day. This leaves a balance of 0.4 pound per day, or 0.005 pound per ton, which we may assume as the loss of cyanide during precipitation, a very insignificant amount.

The results are summarized as follows:

	Per day. Pounds.	*Per ton. Pounds.*
Consumption of KCy in spent solution	14.0	0.179
Consumption during actual leaching	15.6	0.2
Probable consumption in zinc boxes	0.4	0.005
Total consumption of KCy	30.0	0.384

Of our success in precipitating gold from weak solutions I shall speak in its proper place.

"3. *The great difficulty of removing zinc and cyanogen residues from the gold, thus causing loss in melting, and the production of an unclean bullion.*"

I will admit that this was a great difficulty with us at first, and one which for a time seemed insurmountable. It was necessary to devise some means of separating the zinc-sulphate residues from the gold slimes, after the regular treatment with sulphuric acid. Various forms of filter were tried. A perforated false bottom of wood, packed with sand, was discarded after several trials, on account of the impermeability of the layer of slimes which formed on top of the sand. A filter of asbestos cloth was resorted to, but was likewise discarded. It not only proved to be an imperfect filter, but was found completely disintegrated after the subsidence of the action of the acid, a result probably due to the mechanical untwisting of its fibers during the reduction of the zinc. We were obliged at this time to use a succession of washes, in order to dilute and gradually eliminate the zinc sulphate—allowing the slimes to settle completely each time. This method, however, was slow and laborious. A Johnson filter-press was next introduced. It seemed to act fairly well on the slimes before acid treatment, but after the destruction of the zinc the gold precipitate apparently became too finely divided to admit of filtration. A film of not more than ⅛-inch in thickness on the canvas disks of the press seemed to offer a very complete obstacle to the passage of the clear liquid. The pressure against the disks would run up to over 100 pounds; the press would then have to be opened and the disks scraped. This method was found too tedious, and was finally abandoned.

After many discouraging failures, the following *modus operandi* was adopted, and has since been followed with perfect success:

The slimes and fine zinc are discharged directly from the zinc boxes into a redwood vat, 6 feet in diameter and 2 feet deep. This vat is protected on the inside by several coats of paraffine paint, has a slight bottom incline for drainage, and is provided with a 2-inch discharge valve. Here the slimes are treated with sulphuric acid. After the destruction of the zinc, the zinc-sulphate and the slight excess of acid present are diluted by filling the vat with warm water. Within an hour the bulk of the precipitate will have settled to the bottom. The supernatant liquor, to the amount of about 400 gallons, which still contains a small amount of gold slimes in suspension, is then siphoned off into a ten-ton settling vat.

The gold slimes are treated with a succession of these washes, the supernatant liquor being each time drawn off into the settling vat until the amount of zinc sulphate remaining in the slimes is insignificant. The liquor siphoned off into the settling vat, which contains only a very small quantity of slimes in proportion to the total quantity obtained, is left to settle between clean-ups. The clear liquor is drawn off just before a succeeding clean-up, and at long intervals the precipitate is gathered from the bottom and melted.

The bulk of the slimes is finally discharged from the acid vat into a filter box. This box is provided, about a foot from the top, with a perforated partition, which is closely covered with two thicknesses of ordinary mill blanketing. From the compartment beneath this filter the air is withdrawn by means of a steam ejector, and the water is thus removed from the slimes by suction. At the bottom of the box is a 1-inch discharge valve for drawing off the accumulated clear liquid. By occasionally scraping the filter blankets the passage of water through them is greatly facilitated. These blankets are removed and washed after each clean-up, and clean ones are substituted. The partially dried slimes from the blankets are then completely dried over a furnace and melted in crucibles. The zinc residues being thus pretty thoroughly removed from the slimes, the difficulties in melting are reduced to a minimum.

Prof. Christy lays some stress upon the losses in melting. There is sure to be some loss from "dusting," especially where there is a high draft in the furnace flues, and where the pots are carelessly charged with the dried slimes.

For some time a considerable value went into the slag, which had to be shipped to the smelting works; but, after a good deal of experimentation, a very suitable flux has been found, which reduces the slag value to almost nothing. A dust chamber has been constructed in connection with the melting furnace, and an effective damper introduced in the course of the flue. The latter is closed at each charging of the crucible, and "dusting" is thus almost entirely avoided.

Our loss in melting has never been more than barely appreciable; and now, since the introduction of a dust chamber and damper, is wholly insignificant. The wonderfully close correspondence between our actual bullion yield and the extraction indicated by careful assays of charged and discharged tailings would in itself weaken the supposition of any considerable loss in melting. To be sure, our bullion is low-grade, but we suffer no inconvenience from this, except the small increase in cost of transportation and refining in proportion to the value of the bars.

"4. *The failure, in certain cases, to precipitate the gold.*"

Prof. Christy probably alludes here, more particularly, to the difficulty in precipitating gold from a weak cyanide solution. He says that "in the case of zinc shavings it is practically impossible to precipitate the gold from such a solution unless it contains one or two-tenths per cent free cyanide of potassium."

In Bodie practice it has been found perfectly practicable to precipitate gold completely from solutions containing as little as 0.05 per cent of cyanide. Our weak solutions are run through a series of zinc boxes, of ten compartments each, before going to waste. Each compartment has a capacity of about eight pounds of zinc shavings. The solution, after

* Discussion at the Chicago meeting of the Am. Inst. Min. Eng., Feb., '97, of the papers of Prof. S. B. Christy, H. Van F. Furman and G. A. Packard.

passing through about 160 pounds of zinc shavings, is found to be practically free from gold, repeated assays indicating merely a trace.

At the Victor plant, of fifty tons per day capacity, considerable difficulty was experienced in precipitating gold from weak solutions; but by the addition of a third box, making an aggregate of thirty compartments, the trouble was corrected, and most satisfactory precipitation was obtained.

The following table of assays, made at random on solution samples from various zinc boxes at different intervals in the season's run indicates a high percentage of precipitation in both strong and weak solution boxes. These results were obtained by evaporating 250 c.c. (about eight assay tons) of the solution in each case, and assaying the residues:

	Strong or Weak.	Value of the Incoming Solution per Ton			Value of the Outgoing Solution per Ton.		
		Au	Ag.	Total.	Au.	Ag.	Total.
1	Strong (.14-.16%)	$4.24	$.45	$4.69	$ .05	$.02	$.07
2	" " " "	4.39	.43	4 82	.10	.03	.13
3	" " " "	4 03	.44	4 47	Trace	.....	.....
4	" " " "	4.13	.46	4.59	Trace.	.....	.....
5	" " " "	3.32	.38	3 70	10	.06	.16
6	" " " "	3 05	.39	3.44	.26	.07	.33
7	Weak (.04-.07%)	1.24	.14	1 38	Trace.	.....	.....
8	" " " "	2 90	.45	3.35	.07	.07	.14
†9	" " " "	3 82	.57	4.39	.25	.07	.32
†10	" " " "	4.13	.64	4.77	.21	08	.29

†12	" " " "	.52	.15	.67	Trace.	.....	.....

† We have occasionally been puzzled by the appearance in our zinc-boxes of a yellow, aluminous (?) precipitate, which seems to be thrown down in the gold-tanks as soon as the solution leaves the vats. Whenever this accumulates to any extent it interferes somewhat with precipitation. Assays Nos 9 and 10 were made on solutions taken from a box containing a considerable amount of this aluminous slime. The slightly lower percentage of precipitation is apparent. The two following assays (Nos. 11 and 12) were made on a low-grade solution flowing through the same box, after a complete elimination of the aluminous material, and indicates a normal precipitation.

The method which Prof. Christy suggests for recovering cyanide from solutions by means of sulphate of zinc might be very satisfactorily applied to spent solutions containing only a trace of gold. The virtual absence of gold from this waste solution might greatly simplify such a method of gold recovery.

I do not wish to be understood as condemning the objections which Prof. Christy urges against zinc precipitation. I am aware that in many cases this method has been found an imperfect and expensive one. I simply wish to call the attention of those interested in the cyanide process to one very pronounced exception to Prof. Christy's statements, namely, the conditions which obtain in our Bodie practice.

An English View of It.

To the Editor:—The letter in your last edition "British Comment on American Mines," called to my mind one I had recently seen bearing on the same question, extracts from which I now take the liberty to send you. Its suggestions appear to me singularly pertinent to the mining situation at the present moment.

"The only practicable plan for the owners to pursue, in the event of their desiring to insure themselves against—or to minimize—the contingencies inseparable from mining and to derive an adequate consideration for their property, is for them to become their own promoters and retain the management so long as they are the largest holders of shares. To do this would entail only a moderate expenditure on this side (London), and owners in incurring such would only be running the risk that they expect others to do for them *free of cost*. No one wishes to handle mining property, or indeed any kind of property, without making a profit, and it is this profit that stands between mine owners and financial agents to the detriment usually of both, though possibly to the advantage of the unwary—as well as wary—investor. The mine owner requires to recognize that the financial agent has to live, and the latter needs to realize that there is a difference between profit and plunder and when each becomes reasonable in respect to a particular property, then both are likely to be benefited."

San Francisco, Oct. 6, '97.

The strongest solid rectangular beam which can be cut out of a round log is one in which the proportion of breadth to depth is as five is to seven. To ascertain the strongest section that can be got out of any given log, the method is as follows: Describe a circle equal to the section of the log. Draw line ab (a diameter) across it and passing through the center. Divide this line into three equal parts, ac, cd and db. At one of the divisions on one side of the line, as at c, make a line (ce) perpendicular to ab, which will pass through the circumference of the circle at e, on the other side of ab, and at the other (d) make another line perpendicular to ab, cutting the circle on the opposite at f. Join the points ae, af and be, bf, which will give a rectangle showing the strongest section that can be got out of the log. This is the section which all unbraced beams, placed on edge, should have, in order to use the timber to the best advantage. Where timbers are braced, however, the strength is increased by increasing the depth.—Coachbuilder.

The Miner's Wealth.

Robert McIntyre, a Methodist minister of Chicago, has stirred some of his brethren because he grubstaked a miner for the Klondike. The Chicago *Tribune* interviewed Mr. McIntyre on the subject. He says:

Conscientious scruples against such an undertaking? No scruples entered my mind then, nor have they since. It was purely and simply a matter of principle. The Sermon on the Mount and the Ten Commandments don't come into the matter, and theology needn't.

The fact is, I admire a miner's wealth. It's clean. There are no blood or tears on it. It is acquired away from the scheming and the cut-throat competition that characterize ordinary business ventures, where the success of one man so often means the disaster and downfall of some other man, or perhaps a number of men. Nobody has been pinched. Nobody has been wronged. The miner who digs a fortune out of the ground has the satisfaction that he hasn't robbed a soul, even though he become a hundred times a millionaire.

Then, too, there is another factor to take into consideration. The man who makes a fortune on the Board of Trade, or on the Stock Exchange, or in building up a gigantic business house, adds nothing to the world's store of available wealth. The world, in other words, is no richer because he is richer. He is rich, rather, because somebody else is poorer. The miner, on the other hand, whether he digs out $100 or $100,000, adds that much to the world's wealth, and, with the added wealth, he contributes just that much to the possible amount of the world's comforts and pleasures.

As I look at the matter, there are few producers of wealth. The many live on the few. The only man comparable with the miner is the farmer. He gets what he has direct from Nature, but he produces perishable wealth. While he meets a want, his contribution to the world's wealth therefore is not a permanent one like the miner's.

The gold miner is to-day the king wealth producer of the country, and I honor him above all others. It is no dishonor, it needs no apology, to emulate his example or assist him in his efforts. There's the whole question in a nutshell.

It isn't a church matter. The fact is God put the gold in the valley of the Yukon for His children. Any man, consistent with such regulations as are necessary for fair play and the protection of individual interests, has an undeniable right to go there and dig and delve all he chooses. If he pulls out $100,000 he simply makes a draft, not on somebody's bank account but on Nature's treasury. There is no more wrong in that, therefore, than there would be in a man sowing wheat or planting corn and trusting to Nature to yield twenty, fifty or hundred fold. It's a private matter between man and his Maker. There's scriptural authority enough for a man to plant and reap a harvest of grain, and I don't see why there isn't authority enough for a man to dig and delve and reap a harvest of gold dust and nuggets.

As I look at the matter, therefore, the minister who doffs broadcloth and dons a miner's garb and faces the perils of the wilderness, and gets a draft cashed on Nature's treasury for a few hundred thousand dollars or a million or two, is doing humanity a good turn. I don't know by what course he could do more good or add more to the sum of the world's comforts or pleasures. If he can't go to the field of operation himself, it's an honorable thing, I believe, for him to grubstake somebody else.

I can't quite see why a clergyman, if he chooses, should not be a wealth producer. Christian ethics are not against it. There is only about so much wealth in the world, anyway, and life now-a-days is a scramble to get as much of what does exist as possible. I should rank a benefaction above a benediction. But on the miner's wealth, as I just said, there are no blood, no tears, no groans, sufferings, sorrows caused to others.

A minister has just as much right to mine gold or grubstake somebody else as the man who listens to his sermons and helps to pay his salary. It's a foolish notion that a minister, because he is a minister, must apologize for doing openly what he commends others for doing. I have said that the miner who actually adds to the world's wealth is a public benefactor, and that his wealth is the cleanest in existence. Believing that, why should not I offer to grubstake Mr. Gaston?

The cast plate-glass of which mirrors, shop-windows, etc., are made is prepared from the whitest sand, broken plate-glass, soda, a small proportion of lime, and a much smaller amount of manganese and cobalt oxides. The glass, when perfectly melted, is poured upon an iron table of the size required, and the thickness is regulated by a strip of iron placed down each of the four sides of the table. Immediately after it is poured out, the molten substance is flattened down by an iron roller, which lowers the glass to the thickness of the strips at the sides. It is then annealed, or tempered, for several days, after which it is ground perfectly level and polished to a transparent brilliancy.

Petroleum in Texas.

Corsicana is a town of 7000, fifty miles southeast of Dallas. The discovery of oil there was purely accidental, through the efforts of the Corsicana Water Development Company to get a supply of water for the city. An artesian well was put down in the city. The drill pounded its way through a formation known to geologists as ponderosa marl, but familiar to every well digger in Texas as "joint clay," to a depth of 1040 feet, when it seemed to enter a much softer formation, which, when brought to the surface, proved to be a bluish sandy shale, saturated with a fine quality of petroleum. The drill quickly sank through this streak of shale, which was 20 feet thick, and from which oil flowed in large quantities. A few oil wells were put down, and, at a uniform depth of from 1020 to 1050 feet, the sandy shale containing the oil was struck. There was no change in the character of material passed through; it was an unbroken stretch of ponderosa marl, bluish in color and crumbling to dust when exposed to the air. The oil sands vary in depth from 20 to 36 feet. These developments attracted considerable attention in the oil world, and soon other experts and prospectors came in; they looked, pronounced the oil of excellent quality, and wondered how it came there. There was no similarity between the conditions there and those elsewhere where oil had been found, they said, and hence there was nothing upon which to base a reasonable estimate as to the extent of the oil area or the term of its flow. There was no rock penetrated on the way to the oil, none below the oil, and there seems to be no hard casing immediately covering the oil, as had been invariably found in all other fields—still there is the oil, and it is in paying quantities, and the flow has continued with undiminished strength for nearly two years, regardless of the number of wells or their proximity to each other. According to experts, the conditions are entirely new and difficult of satisfactory explanation. The Texas Petroleum Company, organized six months ago, has three flowing wells, the latest of which is said to be producing about twenty barrels per day. The Corsicana Oil Development Company has a well which is flowing twenty-five barrels.

Rates in Europe and America.

The Chicago *Record* gives the following facts bearing on the question of railway rates in this country and Europe:

	Miles.	Hours.	Railway fare.	Sleeper fare.
New York to St. Paul	1314	40	$31 50	$ 7 00
New York to Denver	1937	64	48 75	11 00
Paris to Constantinople	1875	65	71 00	28 00
Paris to St. Petersburg	1600	59	56 00	25 00
Calais to Brindisi	1380	56	66 00	26 00
New York to Omaha	1400	41	32 75	7 50
Paris to Lisbon	1175	48	48 00	22 00
New York to Chicago	960	27	20 00	5 00
Leipsic to Rome	945	35	44 00	15 00
Washington to Chicago	921	24	18 00	5 00
Ostend to Vienna	821	29	33 00	10 00
Paris to Madrid	810	28	34 00	15 00
Paris to Vienna	790	26	30 00	7 50
Washington to Jacksonville	760	20	21 00	5 00
Paris to Rome	775	34	33 00	10 00
Paris to Berlin	663	20	24 00	8 00
Paris to Frankfort	375	15	19 00	5 00

From this it appears that the first-class rate is uniformly almost twice as high in Europe as it is in America.

A correspondent of the Birmingham (Eng.) *Post* states on the authority of a high Russian official that the scheme for a vast canal to connect the Baltic and the Black seas, upon which a number of French and Russian engineers have been engaged for nearly two years, is shortly to be carried into effect. The canal, it is estimated, will have the most colossal effect upon the internal and external trade of Russia, and the writer's authority, who is certainly in a position to speak, gives the following particulars regarding it: The canal will cost $55,000,000 and will be 1110 miles long, 215 feet wide and 27 feet deep. It will be designed to give free passage to the largest ironclad afloat, and at Riga, where the Baltic mouth of the canal is proposed to be, a great naval arsenal will be constructed. The Russian government, it is understood, will contribute a large proportion of the expense, and the governments of the districts through which the canal will pass the remainder.

The tremendous force of the sea was illustrated by an object lesson ashore in New York City last week when five large tanks, built to contain 120,000 pounds of soap, but temporarily filled with water, and situated on the fourth floor of a large building on West Fifty-second street, collapsed and completely wrecked the whole structure, killing three men and doing a large amount of damage. The tanks were each 15 feet high and about 13 feet diameter, and contained 161,703 pounds of water, but the floors and supporting beams proved altogether inadequate to stand the strain. A wave of the dimensions of one of these tanks is not at all unusual at sea, and when such a wave breaks on a vessel's deck the force of the blow can only be estimated by the amount of damage it does in spite of the elasticity of the water beneath the vessel to ease her in receiving the stock.

The Tin Deposits at Temescal, Southern California.

By HAROLD W. FAIRBANKS.

Several years ago, shortly prior to the final suspension of work upon the Temescal tin deposits, the writer was given exceptional facilities for a careful examination of the mine and the country immediately surrounding it. Subsequently a brief description was published, but owing to the political importance of the question at the time no thorough report was attempted. Descriptions of the tin veins occurring here have been given by Blake and Hanks, although little has been published concerning the conditions under which the veins occur and the nature of the ore bodies. In the present paper the writer will add to what is already known, a more detailed description of the veins and the country in which they are found. The report of Hanks referred to above contains an outline of the history of the discovery and the excitement following it, the purchase of the old Mexican grant and the final development by the English company, so that this part of the subject will not be touched upon.

General Geology of the District.—The Temescal tin mine is located in the northwestern portion of the San Jacinto grant about five miles southeast of South Riverside. This portion of the grant consists of rolling hills having an elevation of nearly 1,000 feet, and formed of a great variety of rocks. To the west, separated by the Temescal valley filled with late Miocene sediments, is the Santa Ana range, the most striking topographic feature of the region. It is high and steep, contrasting strongly with the rolling though sometimes quite mountainous country to the northeast. Its elevation is doubtless due to a great fault line, the northern portion of which passes through the Temescal valley. Immediately adjoining the valley on the east is a more or less connected strip of highly metamorphosed rocks associated with porphyries, but the most of the country in that direction is granite.

The tin deposits lie nearly in the center of a rudely semi-circular area of granite about two miles in diameter and connected on the east with the great body of similar rock extending indefinitely in that direction. The sedimentary rocks along the edge of the granite area consist of quartzite, mica schist and conglomerate of unkown age. A part at least of the slates and limestones of the Santa Ana range are carboniferous, but further than that we have no information. Extensive bodies of porphyry also border the granite. They vary much in appearance, in some places being of a grayish color and almost devoid of distinct crystals, but more generally the rock presents a groundmass almost black in color in which are sprinkled white feldspar crystals and more rarely those of quartz. It is difficult to say which is the older, the granite or the porphyry. In the neighborhood of the junction both rocks change their character somewhat, although each is distinct. With perhaps one exception, none of the fine-grained granitic dikes abundant in the coarse granite were noticed penetrating the porphyry, but there are bunches and dike-like protrusions of the latter in the granite near the contact.

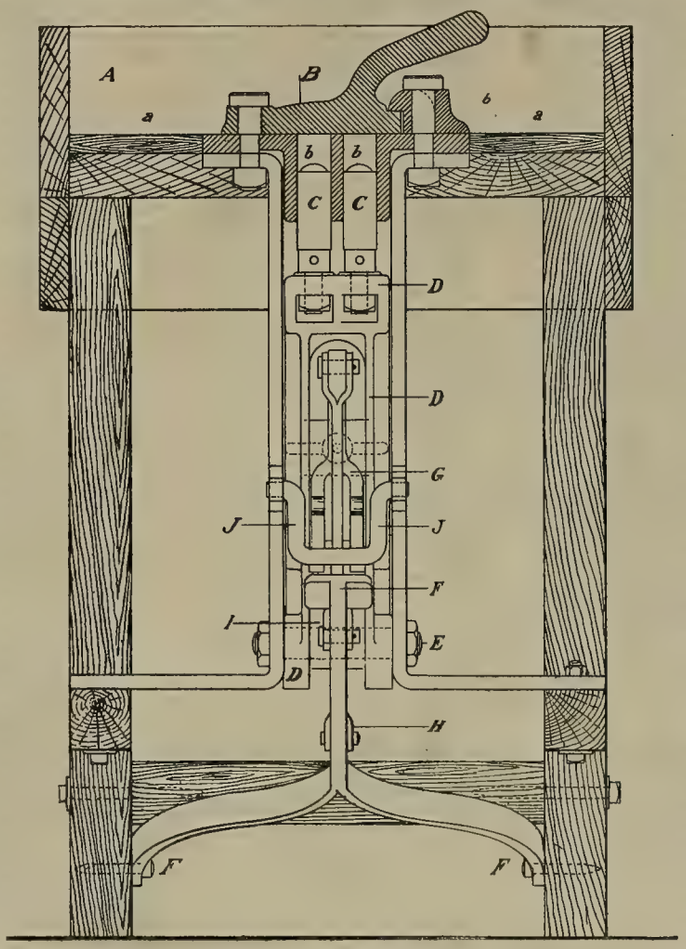
The granite is distinctly intrusive in the metamorphic rocks, as bunches of it project up through them here and there. The granite varies considerably in texture although the main body has a uniform composition. Macroscopically it shows two kinds of feldspar, one a pale brownish color and the other white, abundant quartz and a small amount of dark silicate. Under the microscope it is seen to consist of plagioclase, orthoclase, and quartz in nearly equal proportions, with a much less amount of biotite mica. Towards the outer edges of the granitic boss in which the mine is situated are numerous dikes of a very fine-grained granite consisting almost wholly of quartz and orthoclase in interlocking grains. The proportion of quartz seems to be greater in some of these dikes than in the coarse granite to which they are genetically related.

The Vein System and Tin Deposits.—The semi-circular area of granite and portions of the adjoining porphyry have been fissured in a general northeast and southwest direction along almost innumerable lines and a black vein matter deposited. The veins are generally small, varying from one-fourth to a few inches in thickness, but in the case of the main tin-bearing vein an enormous size is reached at Cajalco hill. As the hill is approached the veins become larger, and finally culminate in this elevation, which is about 300x250 feet in diameter at the base. The veinstone of which it is mostly composed rises in prominent and bold croppings. With one or two unimportant exceptions the material of which this as well as the other veins is formed consists wholly of tourmaline and quartz, with which the tin ores are locally associated. The larger veins, and the Cajalco in particular, are very irregular in size, sometimes appearing to be mere bunches in the granite. A few hundred feet northeast of the hill the vein has narrowed to 6 or 8 feet, and it is here that the large body of tin was first discovered and the main shafts sunk.

A slide prepared from one of the smaller veins, which in the hand specimen appeared to consist wholly of tourmaline, showed bunches of tourmaline crystals radially arranged and embedded in interlocking quartz grains. The crystals are recognized as tourmaline by the hexagonal cross section, parallel extinction, polarization and frequent presence of fibrous terminations, although the terminal crystal faces are sometimes present. In the most of the sections prepared the tourmaline appears to be exceptionally opaque, sometimes the border is opaque while the center is feebly translucent. With the blowpipe the material fused easily with slight intumescence and became magnetic. The reaction for boron was pronounced.

The large Cajalco vein consists of tourmaline and quartz in almost equal proportions. This aggregate breaks up quite easily, as it is porous, the spaces being lined with drusy crystals of both components. The deposits have evidently been formed in fissures through a gradual replacement of the granite walls. Judging from an examination of the seam-like veins the silicates appear to have been attached easier and removed first. In places the larger veins seem to blend into the granite and it was first though that some of the quartz might be a remnant of the granite, as it is rarely if ever segregated in bunches. A microscopic examination showed that this view was undoubtedly false, as the grains interlock in a different manner from those in the granite, and in addition contained fluid and liquid inclusions. The relative proportions of quartz and tourmaline in the Cajalco vein are so constant that it presents a uniform appearance. Although the mine reports speak of the occasional presence of arsencial pyrites and copper, nothing of the kind came under the observation of the writer. The bunches in these veins, and especially the enormous one forming Cajalco hill, could have been formed in no other way than by replacement, although it is difficult to conceive of its having taken place on such a large scale.

With the earlier reports upon this property nearly all the veins were considered tin-bearing, but at the time the writer made the examination shortly before the mine closed, after diligent prospecting the company had succeeded in finding traces of tin in only one or two veins besides the one worked. Tunnels had also been run into Cajalco hill, but in this great body of vein matter nothing was found. The narrower portion of the vein to the northeast furnished all that was ever milled. At the time of examination the vein had been opened to a depth of 180 feet by two working shafts, exposing the vein horizontally for 300 feet. Here the vein has a width of 8 feet or less. The main ore body occurs in the center of the mine between the two shafts and extends down on the dip of the vein. The tin oxide is distributed either through the vein matter or in stringers and bunches. In the latter case it is sometimes found in nearly pure condition. The average of the ore milled was however only about 5 per cent of the oxide. Seams of clay are generally found on or near the sides of the vein, showing some movement since the deposition took place. The walls are quite irregular and sometimes bunches of granite are found wholly inclosed in the vein. The analysis of the ore made by Genth, and quoted by both Blake and Hanks, shows silicic acid 9.82 per cent, tungstic acid .22, oxide of tin 76.15, oxide of copper .27, oxides of iron and manganese, lime and alumina 13.54. This must have been an exceptionally pure specimen and wholly free from tourmaline.



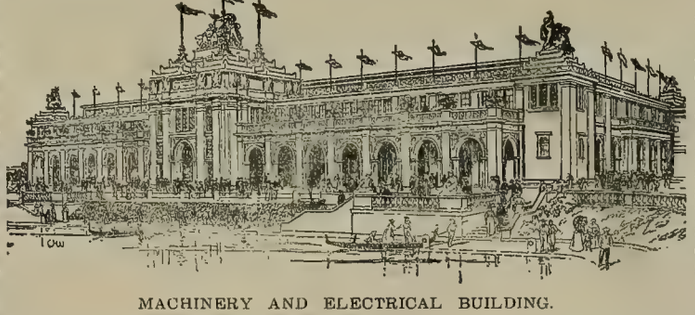
THE JONES CUPEL MOULDER.—(See page 357.)

The tin ore occurs in two forms; the more important and common variety is either massive and of a brownish color, or in clear reddish brown crystals lining cavities; the less common variety is that of "wood tin," which appears uncrystallized and in the form of thin layers.

It is not known to the writer whether the ore body which was being followed down finally ran out or not, but at any rate it appears that it was unprofitable to work. The great richness of the ore in places is one of the remarkable features of this deposit when compared with most of the other known occurrences of tin. Another remarkable fact is the great size of the main vein as shown in Cajalco hill and its uniformity and simplicity of composition. It appears that the contents of the veins represent the entire replacement of the granite bordering what were originally narrow fissures. The agent which accomplished this was probably heated water carrying various minerals in solution, the economically valuable one, tin, being deposited only in places under exceptional conditions.

Machinery and Electricity Building, Omaha Exposition.

The Machinery and Electricity building is in the northeast corner of the Grand Court, east of the Mines building and across the lagoon from the Manufactures building. It is 304 feet front by 144 feet in depth. At each of the four corners are groups representing the early supremacy of man over the untamed forces of nature. These forces are represented by wild animals. Men in their youth are seen subduing them for the simple purpose of escaping injury and the preservation of their own lives at the sacrifice of the natural forces. A higher supremacy is shown by the center group, which is the dominating feature of the entire design. In this, man developed beyond the youthful stage, having wisdom, takes these same untamed, unharnessed forces of nature and harnesses them to his chariot, making them do his bidding, symbolizing in a direct way the service which machinery does for man in using the powers of steam, fire, electricity and gravity.



MACHINERY AND ELECTRICAL BUILDING.

TO FACILITATE the transportation and preservation of hay an apparatus has been devised at Buenos Ayres for compressing it to one-tenth its normal bulk. In this form, as "hay biscuits," it can be preserved dry and sound an indefinite period, without losing its flavor or value as food.

Temperature Below Ground.

In the issue of Sept. 25th appeared an article on "The Deepest Well in the World," now being bored near Pittsburg, Pa. Some data therein showed that theoretically the temperature at a depth of 10,000 feet would be 228° F., practically 167° F. The question of the temperature that is found at great depths underground is an interesting one, and is a frequent subject of discussion among mining men. By some the temperature is estimated to increase one degree for every 45 feet of depth, until a depth of 2000 feet is reached, and below that as much as one degree for every 25 feet of additional depth, though this is not in accordance with the generally accepted theory, which is that the temperature increases one degree for every 60 feet in depth. In this regard it may be said that it is impossible to obtain accurate records with an ordinary thermometer, in an open well or shaft. Most of these estimates in regard to underground temperature have been obtained from a deep salt well in Austria.

An exact investigation was made at great depth by Charles Forman of Los Angeles, Cal., in the Forman shaft on the Comstock to a depth of 3200 feet. Mr. Forman obtained underground thermometers from Europe, then, while the shaft was being sunk, he had holes drilled into the sides every 50 feet or so, in which the thermometers were placed, closing the holes with clay, and leaving the thermometers in for twelve hours. The experiment attracted much attention among European scientists. Following are the temperatures of the ground from the surface to a depth of 2300 feet. It will be noticed that the increase of temperature is by no means regular:

Depth.	Temperature. Degrees.	Depth.	Temperature. Degrees.
100 feet	50½	1300 feet	91¼
200 feet	55	1400 feet	96¼
300 feet	62	1500 feet	101
400 feet	60	1600 feet	103
500 feet	68	1700 feet	101¼
600 feet	71½	1800 feet	105½
700 feet	74½	1900 feet	1 6
800 feet	76¼	2000 feet	111
900 feet	78	2100 feet	119½
10 0 feet	81½	2200 feet	116
1100 feet	84	2300 feet	121
12 0 feet	80½		

At a depth of 2300 feet the temperature of the water was 130°.

On this subject W. L. Watts, a field assistant of the State Mining Bureau, tells the Los Angeles *Times*: "Below the stratum of invariable temperature, i. e., below the depth at which the temperature of the rocks are sensibly influenced by the change in temperature at the surface of the earth, experiments have shown that there is a rise in temperature equal to about 1° Fahr. for every 60 feet in depth. In different localities this ratio of increase has varied from 1° for 45 feet to 1° for 60 feet in depth. This variation is probably owing to the difference in the conductive power of the rocks, and the proximity to sources of volcanic heat. The experiments thus far made have been at depths all of which are less than one mile. Since one mile is only about one three thousand nine hundred and fifty-sixth of the average distance from the surface to the center of the earth, the experiments are insufficient to warrant a definite conclusion concerning the internal temperature of the earth."

Northwestern Mining Association.

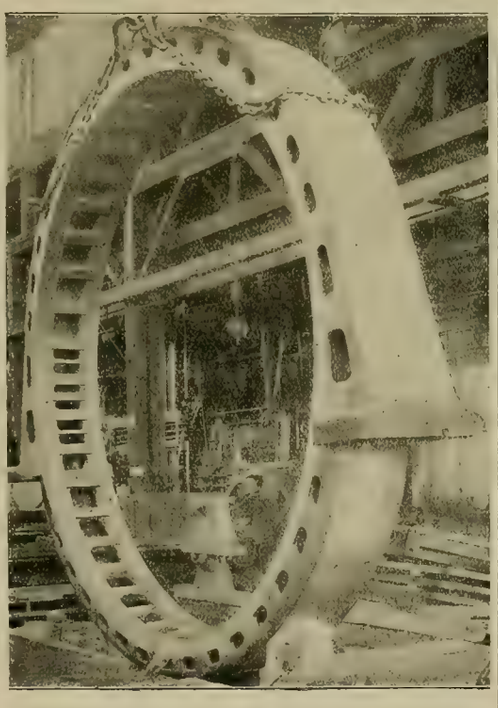
The fourth gathering and second annual convention of the Northwestern Miners' Association met in Spokane, Wash., on the 7th, 8th and 9th inst. Among the subjects discussed were the following:

National department of mines; National and State mining laws; The present stage of mining development; Demand for smelters and reduction plants; Advancement in the science of smelting; What is pay ore? Is it that which pays a profit above cost, or that which may be made to? How to open a mine; The value of a mine—how established; What is the best method of concentration? Tramways—relative and comparative merit; Solvents for gold extraction; Gold camps of the Northwest, where located and what the class and character of ore; Silver-lead camps, where located and what the class and character of ore; Copper camps, where located and what the class and character of the ore; Railroads and lien lands—can the railroad give patents which will give the miner good title to the ground and contents; Suggestions as to means to be employed by State or province which will best assist in opening up a district, and as to funds; Freight rates on ores, as to most equitable method—one rate or relative rate, depending upon the value of the ore; State Geological Surveys—their importance as to classification and consequent protection to mines as versus railroad patents; Reliability and assistance in attracting capital for mining development; General utility in showing the value of all kinds of mineral deposits—metallic and non-metallic; Co-operation with other mining associations; Maintenance of permanent headquarters and probable cost of same; What should be the work for the coming year's business? Common minerals—their uses and value; Alaska and its mineral resources; Rivers and streams within our territory and their protection for mining uses. Quartz mining and methods employed; Placer mining and methods employed; How to timber a mine; Mining ventilation.

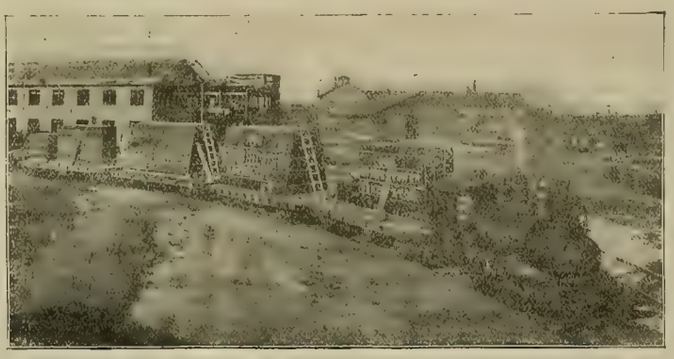
A Huge Generator.

The great three-phase alternating current dynamo intended for the new station of the Edison Electric Illuminating Company of Brooklyn, N. Y., has been shipped from the works of the General Electric Company, Schenectady, N. Y. To transport this exceptional generator to its destination not less than five flat freight cars were needed, and Fig. 3 shows the train with four of them hauled by the G. E. switching engine to the tracks of the New York Central railroad.

REVOLVING FIELD FRAME, BROOKLYN GENERATOR.



ARMATURE FRAME.



FOUR OF FIVE CARS LOADED WITH BROOKLYN GENERATOR ONLY.

The generator is rated as A. P. 40-1500-75; that is, it is an alternating current three-phase machine, of the revolving field type, with forty poles and a normal output of 1500 kilowatts when running at 75 revolutions. In designing this, the instructions, so far as cost and expense of operation, were duly considered in relation to the conditions of service, but the design was left entirely to the General Electric Company. The machine which has resulted would under ordinary conditions be considered one of 2000 kilowatts. In use it will be driven directly by an engine giving its highest economy at a little over 1500 kilowatts, or which can be operated to advantage, and will probably be operated at an output of 2000 kilowatts. The engine selected is a four-cylinder triple expansion engine built by the McIntosh & Seymour Company.

The dynamo is wound for an output of 2000 kilowatts at 6600 volts. The armature windings are mounted upon the stationary part of this machine, shown in Fig. 2. These windings form one of the most interesting features of the construction of this class of machine, the method of coil construction and insulation being especially adapted to high voltage work. The armature frame is built to give perfect ventilation to the windings and the machine is guaranteed to operate continually with a heavy overload with only very moderate heating.

The field structure is built upon a heavy cast iron spider, with a steel ring bolted to the ends of the spokes. To this ring are bolted forty field pole pieces, each built up of carefully annealed sheet iron laminations. Each pole piece carries a coil made up of heavy copper strip wound on edge. All these coils are connected in series, the direct current used for excitation being carried through them. This field structure will be mounted on the steel shaft, 27 inches in diameter, of the triple expansion engine. On the same shaft are the engine cranks and a heavy fly wheel, of such weight that the angular variation of speed within each revolution at full load cannot exceed one-quarter of 1 per cent.

The armature structure will be supported on rails instead of a masonry foundation. This allows the armature to be moved along the rails away from the field, giving easy access to both field coils and armature winding.

The size of this machine and, incidentally, the range of the dynamo and motor work of the General Electric Company may be gauged from the illustration, which shows standing beside the armature frame a General Electric induction motor of ½ H. P. The dimensions of the generator are as follows:

Span of casting or lower half of armature frame	25 ft.
Vertical outside diameter of armature frame	31 ft. 2 in.
Length along shaft	51 in.
Weight of revolving field	59,000 lbs.
Total weight	163,000 lbs.

This machine is destined for the new station of the Edison Electric Illuminating Company, situated at Bay Ridge, at the entrance to the Narrows of New York harbor, on the Long Island side. It will deliver the high potential three-phase current to a system of conductors, over which it will be distributed at different voltages for many purposes. The territory over which the Brooklyn company is preparing to operate covers over 75 miles, and by the use of a great central station at tidewater, with substations at convenients points, the company proposes to distribute current over this vast section. A large portion of the current will be transformed down to 375 volts and then, fed to rotary converters, will be distributed as low votage direct-current three-wire system now receiving current from the stations already in operation. A part of the high potential current will be used to drive synchronous motors directly coupled to arc machines, as well as to drive other motors for various power purposes.

To PREPARE a piece of steel so as to file or turn it into any desired shape it is necessary to soften it before it can be practically worked. To do this, heat to a red heat and bury in a box of sand, which has been previously heated nearly red hot. Allow the steel to remain in the sand until cold enough to handle, and it will be very soft. Never follow the practice of some smiths and bury the hot steel in the fire when going home at night, leaving it to cool off after the fire goes out. Such practice is very bad. The carbon in the steel is changed by remaining in contact with the hot carbon of the fire, and the metal may not be as good steel in the morning as it was at night.

THE number of minor planets known between Mars and Jupiter now considerably exceeds 400, of which M. Charlois of Nice has discovered 86, while Herr Palisa, the Austrian astronomer, has detected 83. The magnitudes of the first 400 of these planets have just been tabulated by Herr G. Huber. All are telescopic, only two being brighter than the eighth magnitude, while of the later discoveries—the second 200—nearly all are of the twelfth magnitude, or smaller.

Scientific Progress.

The Age of the Earth.

In a recent lecture at the Victoria Institute on the "Age of the Globe as an Abode Fitted for Life," Lord Kelvin maintained that if heat had been uniformly conducted out of the earth at its present regular rate, the globe twenty thousand million years ago would have been a molten if not a gaseous mass. A further argument against the huge lengths of time required by the older geologists was sought in the constantly diminishing velocity in the earth's rotation resulting from tidal action. The earth was revolving faster a thousand million years ago than now, and consequently centrifugal action was greater. If the globe had become consolidated while it was traveling at a faster rate, it would have possessed greater oblateness and the length of the equatorial radius would have been six and a half kilometers more than it is. Judging from the properties of rocks and by underground temperatures, the date of the solidification of the earth was probably twenty or thirty million years ago. As to the origin of the atmosphere, at the time of solidification there could have been no free oxygen, so far as could be determined, and no chemical reaction by which it could be liberated. Vegetable life and sunlight must have come into play to prepare our atmosphere in the course of a few hundred or thousand years. A serious geological question was the mode of production of the ocean depths and of the eminences of the continents. Many phenomena were doubtless due to strain on cooling, but that did not afford a sufficient explanation in this case. The author thought the cause was change of density by crystallization. Perhaps the strongest argument against unlimited geological time was afforded by the heat of the sun, which may have illuminated the earth for somewhere about twenty million years. The latest geological estimate of the time required for the formation of all strata since the beginning of the Cambrian rocks was seventeen million years, and the author could hardly be spoken harshly of when he said that this earth could not have been a habitable globe for more than ten million years.

The Wastes of Civilization.

"Improvident Civilization" was the subject of the chairman's address by Prof. R. T. Colburn in the section of Social and Economic Science of the American Association. Touching the currency question, the speaker observed that when we speak of value, equivalency, wealth, risk, trust, distrust, panic, prosperity, we are dealing not with concrete substances like gold pieces, but with states of mind. Yet these ideas lie at the foundation of commercial exchanges and monetary science. "Have any of you ever imagined what would happen if some modern Rosicrucian should succeed in the turning of base metals cheaply into gold? * * * Such a discovery would introduce into the world of commerce, and indeed into all fiscal relations of men, an appalling confusion—first, by a general rise of prices, and second, by a dislocation of fixed payments of interest, salaries and otherwise. Among other curious results we should witness would be a change of sides and tunes between the advocates of the gold and silver standards. * * * The same thing would happen, only more slowly, if a vast deposit of gold were unearthed; and if, after gold was thus discredited by a practically inexhaustible supply, the attempt were made to put silver in its place (the price of which would be enormously enhanced), this state of things would be liable in its turn to be upset by similar discoveries." By precipitating the necessity of inventing some more efficient tool of exchanges, a scientific and more stable enumerator of values, the after benefits to mankind of such an event might compensate for all the disaster it would temporarily cost. The speaker declared our present civilization not abreast of the knowledge of the time and not yielding to mankind nearly the amount of comfort and well-being it might be made to do. As examples of its defects shown in the improvident tendencies of modern life, the speaker cited the waste of warfare and armament, the decadence of races, pernicious competition, spendthrift luxury, the blight of parasitism, the power of superstition, and the diversity of languages.

We are indebted to the sun for light by night as well as by day; for warmth within doors as well as without. Strolling through a town lit up by innumerable lamps, or whirled along at the heels of a locomotive, it is a pleasant thought that the emanations of suns which rose and set millions of years ago—which rose and set in seeming idleness, and to all appearance, in wasted splendor—are now reproduced to enable us to cope with darkness or to conquer space without moving a muscle. There is something captivating in the thought that the great rector mundi was working for us when as yet there was no sign of man—indeed, no promise of his coming—and with quiet patient labor laying up from day to day those treasures of light and heat which are infinitely more valuable to us than all else we possess. No one who has studied geological processes can repress a feeling of surprise, perhaps of impatience, at the slow, deliberate step with which nature ever marches up to her goal. But when we think of the sun toiling in lonely splendor to store our planet with fuel—we had almost said with his own embodied beams—it seems to reconcile us in some degree to the august and awful chronology of the universe.

The barometric measurements of the height of Mount St. Elias by the Prince of Savoy accord closely with those of Professor Russell, who estimated it as 18,100 feet. These figures give the peak the second rank on the continent of North America. Orizaba, an extinct Mexican volcano, is believed to be 1,200 higher. South of British Columbia our highest mountain is Mt. Whitney, on the border line between Tulare and Inyo counties, Cal. Regarding the height of Mt. Whitney, under date of Oct. 8, '97, in response to a query from the editor of this paper, Prof. Geo. Davidson of San Francisco writes: "The authority which I accept for the elevation of Mt. Whitney is Secretary of the Smithsonian Institution. He determined the height above Lone Pine, Inyo Co., by triangulation, and I obtained from Mr. Yelverton the height along the railroad above the sea. The result was 14,522 feet, which he has published." There are several mountains in the Andean chain which are loftier than either Mount St. Elias or Orizaba, Cotopaxi, for instance, is believed to be about 19,000 feet high, Arequipa 20,000, Chimborazo 20,545, and Aconcagua about 23,000.

California sends two expeditions this month to India to witness a total eclipse of the sun. Prof. Burckhalter of the Chabot Observatory heads one: Prof. Campbell of the Lick Observatory represents the State institution. The expedition from the Chabot Observatory leaves October 30; Prof. Campbell's on the 21st. The Chabot expeditions will use the photographic, and the Lick the spectroscopic method. It is believed that these form the most complete expeditions that ever made an attempt to observe an eclipse. Prof. Burckhalter, who leaves on the steamer Belgic on October 30, will reach Hongkong November 28. On December 2 he will take a P. & O. steamer for Bombay, where he should be by December 19; from there by rail 300 miles. The eclipse occurs there on January 22, '98.

Helium, it will be recollected, is a chemical element which was known to exist in the sun and some of the stars long before it had been discovered on the earth. When found on our globe, two years ago, it was discovered in a rare mineral of Norway named cleveite. Since then cleveite has been in demand in chemical laboratories, and its rarity has made it costly. Recently a mine was opened near Ryfylke, Norway, containing cleveite, which has been found rich in helium, and sells for about $5 per pound.

Mechanical Progress.

Low Cost of Steam Power in New England.

In our issue of July 17 we published some data furnished us by Mr. F. P. Sheldon, mill engineer, of Providence, R. I., concerning the cost of power in New England cotton mills with cheaper grades of fuel, a subject he had been investigating, and found from actual accounts that two mills were running at a cost of less than $12 per H. P. per year, the lowest figure being a H. P. for a year for $11.64, the coal costing $1.76 per ton.

Through the courtesy of Mr. John Waterman, treasurer of the Warren Manufacturing Company at Warren, R. I., we have received the figures relating to the cost of operating that plant, which, it seems, is operating at less cost than any plant yet reported.

The plant consists of a vertical cross-compound condensing engine built by the E. P. Allis Company, with high-pressure cylinder 32 inches diameter, and low, 68 inches, both 5-foot stroke and making 75 revolutions per minute. The cylinders have a ratio of volume of 1 to 4.5 and the working pressure is 150 pounds. They are provided with Corliss valve gear, the valves being located in the heads, and separate eccentrics work the steam and exhaust valves. The condenser is operated by an independent air pump driven by a small vertical Corliss engine. The load now carried averages 1950 H. P., and to give this the required mean effective pressure of the high-pressure cylinder is about 55 pounds, and of the low-pressure cylinder about 12 pounds. The steam pressure is 155 pounds. The boilers are of the Heine water tube pattern, having 216 square feet of grate surface and about 7500 square feet of heating surface. An exhaust steam heater in the exhaust pipe of the low-pressure cylinder warms the water to about 120 degrees, and it is then pumped through a Green economizer, which carries the temperature to a point varying from 215 degrees to 250 degrees. Draft is produced by a chimney 175 feet in height.

The coal used is a semi-bituminous of a somewhat inferior grade to Cumberland or Pocahontas, and costs $2.26 per gross ton delivered in the yard close to the boilers.

The following is a tabulated statement of the cost of power:

Fuel per H. P. per year of 3070 hours	$ 4 70
Labor	1 88
Supplies and repairs	42
Total operating expenses	$ 7 00
Interest at 5 per cent	$ 2 05
Depreciation at 5 per cent	2 05
Taxes	41
Insurance	04
Fixed charges	$ 4 55
Total cost of power per year	$11 55

The fuel as above given includes the fuel used in banking fires at night and that required for the supply of five slashers.

Mr. Sheldon, who forwarded the figures to us, writes that the economy at Warren is better than anything he had ever found, and believed it due to the large size of the plant reducing the labor and supply account, and to the low cost of fuel and low rates of insurance and taxes; also on account of the low cost of the plant per H. P. due to its large size. If the steam used for other purposes besides power were deducted, Mr. Sheldon believes it would reduce the fuel by 10 per cent, or 47 cents per H. P. per year, making the total $11.08. The tons of fuel used per H. P. per year is 2.08.

It is said that the engine uses about 12½ pounds of feed water per indicated H. P. per hour. The coal consumption is about 1.55 pounds per indicated H. P. per hour. Although these figures show a remarkable economy, we believe them to be within the bounds of credible data. With good firing, a boiler plant equipped with heaters such as that referred to ought to give a working evaporation by the week of 10 to 1, and the engine should produce a H. P. with a consumption of not more than 13 pounds of feed water per hour for the same length of run. The engine alone should work, therefore, with an economy of 1.3 pounds of coal per H. P. per hour, leaving 25 pounds of coal per H. P. for the miscellaneous work of slashing, etc. The latter is amply sufficient for that work, and for all reasonable contingencies.—Engineering Magazine, Sept. 4th, 1897.

Testing a Boiler to Destruction.

At the recent convention of the American Boiler Manufacturers' Association, held in Philadelphia, John O'Brien described the testing of a boiler to destruction. The boiler was made and the tests were instituted and carried through by the O'Brien Co. The boiler was 60 inches in diameter by 12 feet in length. The shell was ⅝ inch steel of 60,000 pounds tensile strength. The heads were of ¾-inch steel. There were fifty-six 3½-inch tubes. The front head was braced with five ½x4-inch flat stays, doubled. The boiler was made of two rings, designated A and B. The joint of ring A was a butt joint with inside and outside straps. The joint of B was a triple-rivet lap joint, with an inside strap extending 2½ inches each side of the ends of lapped plates. The circular seams were single riveted. The results of the tests in which hydraulic pressure was employed are indicated by the following record:

TEST NO. 1.—MARCH 29, 1897.

Ring B. *Inches.*

At 300 pounds pressure ring expanded 1⅜
At 450 pounds pressure ring expanded 2⅝
At 750 pounds pressure ring expanded 3½

Ring A.

At 300 pounds pressure ring expanded 2⅝
At 450 pounds pressure ring expanded 3½
At 750 pounds pressure ring expanded 5

TEST NO. 2.—APRIL 4, 1897.

Ring B.

At 625 pounds pressure ring expanded 3⅞
Increase in expansion over test No. 1 ..... ⅛

Ring A.

At 625 pounds pressure ring expanded 5⅜
Increase in expansion over test No. 1 ..... ⅜

TEST NO. 3.—APRIL 5, 1897.

Ring B.

At 350 pounds pressure ring expanded 4 1-16
At 400 pounds pressure ring expanded 4 1-16
At 625 pounds pressure ring expanded 4 7-16
Increase in expansion over test No 2 0-16
Total expansion for the three tests 4 7-16

Ring A.

At 350 pounds pressure ring expanded 5⅛
At 400 pounds pressure ring expanded 5⅛
After 400 pounds pressure no perceptible change occurred.
Increase in expansion over test No 2 ..... ⅛
Total expansion for the three tests 5⅛

At 900 pounds pressure the boiler ruptured on the side, horizontally in the second ring about 18 inches above the riveted joint, in the whole plate, the rupture being about a foot long.

Making Compact Steel Castings.

Two new processes related to the manufacture of steel and steel castings have lately attracted the notice of those engaged in these industries. In recent news dispatches it has been announced that the Government had been paying $400 a ton for armor plate, but had reached the conclusion that $300 was enough, and had an offer from an American firm to supply equally good plate for about $110 per ton. It is said that the process which this firm proposes to employ is a modification of the famous Bessemer process. In the old Bessemer converter air jets are forced up from below into the molten metal, which is kept boiling thereby. The impurities are burned out in this manner, but more or less gas is "occluded," or hidden away, in the steel by the operation. In the improved system the air is injected only into the floating scum, or scoria, and not into the metal itself. Great claims are made as to the efficacy and cheapness of this process. The other new method is applicable to the operation of casting, although it has the same general object in view, the prevention of bubbles. Powerful air pumps are connected with the moulds in such a

manner that when the molten metal is poured in all secluded air and other gases are extracted promptly. The pumps act not only on the casting chamber, but also on certain vacuum chambers near it. Pipes with valves connect them. The latter are opened at the right juncture, and the outer chambers suck all gaseous matter from the mould. Hydraulic pressure is applied at the same instant to the mould itself, so as to produce a flawless, homogeneous casting.

A Remarkable Machine.

A new machine has appeared on E. H. R. Green's Texas Midland road, that seems destined to be of considerable value in California for mining and irrigation. A Houston man thus describes it: The ditcher is a steel platform car, 50 feet long, having erected at its center a revolving crane, and is provided with the necessary tools and attachments for loosening the earth at both sides of the track, placing it where required, and shaping up the roadway uniform. The ditcher is hauled by a locomotive, and the entire machine is controlled by the locomotive's ordinary air pump. The different tools are attached to either side of the car and extend outward to desired distance. The mammoth plow is first used to make a furrow at sides of track for the ditch or drain. The plow has the appearance of an ordinary breaking plow, except that instead of handles it has an upright bar about 5 feet long at the rear end of the beam. The plow is attached to forward end of ditcher by a heavy cable, is maintained at proper distance from the side of car by brace, and the hoisting cable of crane is attached to nose of plow to regulate depth of cut by raising and lowering front end, it is kept parallel with track by an air-operated piston which extends outwardly from car at right angle to track, and attached to the upright at rear of beam. The plow moves along apparently unguided, steadily and uniformly, all operations being performed by but one man at the controlling valves; it makes a furrow 30 inches deep, 24 inches wide, and miles in length, in any kind of soil. The plow is followed by the scraper, an immense steel tool that throws the material toward the track, and in that way builds up and strengthens the embankment. Next comes a tool called the shoulder former, which evens off the surface of the roadway to a uniform contour. After this operation the scraper is reversed and takes up all the surplus dirt from the now perfectly formed ditch, and casts it 20 to 30 feet from the track, leaving the drain unobstructed. If, after plowing a cut, more material is turned up than required to form the bank, a scoop or slush-scraper is put into service, which takes up the dirt and carries it to the end of the cut, where no other material is available. The crane is capable of raising and swinging a load of 8,000 pounds, and in emergencies forms a rapid wrecking car, quickly gotten into action, as it requires no generation of steam, it only being necessary to couple on a locomotive, make the air connections, and go to work.

TWO UNUSUALLY large locomotives have been delivered to the Santa Fe Pacific road, the first of a consignment of eight engines built for the Santa Fe, after plans submitted by Superintendent of Machinery Player, and are to be used on California trains 1 and 2 from Topeka to Las Vegas, New Mexico. The engines each weigh over seventy tons. From rim to rim the driving wheels measure 6 feet, and the cylinders are 28x19½ inches. The engines are constructed for a pressure of 180 pounds of steam, or twenty pounds over what was a few years ago considered a remarkable pressure. The engines are built especially for pulling heavy loads at a high rate of speed.

THE *Age of Steel* says: "The revival in mining industries is not likely to diminish, stimulated as it is by fresh discoveries of minerals all over the world. We are probably entering on a mining era that in its scope and duration has had no precedent in the history of man. In Africa, Australia, Corea, Siberia, South America and beyond the northern spurs of the Rockies to the terminal of the Andes the pick of the miner and the hammer of the geologist and explorer are being heard."

MINISTER BUCHANAN, at Buenos Ayres, has supplied the Department of State at Washington with copies of decrees issued by the Argentine government inviting proposals for the construction in Buenos Ayres of a central railroad station, to cost not exceeding $4,000,000. For the first time in the history of such public works the Government has invited bids from citizens of the United States, through the Argentine legation in Washington.

AN improved range finder for field glasses has a flat dial plate, subdivided to correspond with the focus of the glasses, rigidly attached near the rear end of the adjusting screw to the frame of the glasses indicating the adjustment upon a dial. A small wheel upon the adjusting screw turns it so that it will readily focus the glasses for various distances, and enabling the user to also estimate correctly the speed of advancing or withdrawing objects.

Electrical Progress.

Flashlight Call Signals.

Superintendent McHenry, of the Rarus mine, Butte, Montana, is the inventor of a system of flash signals for mines, which the *Inter-Mountain* thinks may prove as beneficial to the miners in the depths of mother earth as the flashlight is to the mariner on the ocean wave. The flash signals have been in use several months in the Rarus mine and have given such satisfaction that their adoption in other mines of the district is only a matter of time. Within a month it is likely that the system will be in use at the mines of the Boston & Montana Company. It is such an inexpensive system that any mine where electric lights are used can be equipped with a trifling cost.

The system consists of a switch cut into the main circuit at each level. The switch box has a projecting lever by which it is operated. When a carman, shift boss or miner wishes to signal the station tender that his presence is required at a certain level, he simply pulls the lever from its contact the number of times corresponding to the signal for that station, breaking the current each time, and then throwing on the light again. It can be done in an instant, in fact, in much less time than the bell rope can be rung, and has the added advantage that the operator does not expose himself to danger in the shaft and is less liable to give a wrong signal. In fact, it is direct communication with the station tender himself, and not, as heretofore, through the engineer.

The signal is flashed immediately through every portion of the mine where electric lights are used. If the station tender is awake in any portion of the mine electrically lighted, the signal reaches him and by counting the flashes can tell in an instant where he is wanted. But the signal can also be used for a variety of purposes. As a danger signal to the men employed under ground it will be found useful and perhaps result in the saving of many lives. In case of a cave or of fire the danger signal—nine bells or flashes—can be first given, followed by the number of the level where the trouble has occurred. In this way the men on stations or in the levels can be instantly apprised of any danger.

Nearly all of the big mines of the camp are now lighted by electricity, not only at the stations but at the turn sheets and in or near some of the workings, so that the introduction of the system would only entail a nominal cost. The mines of the district are getting so deep that the old bell rope system is getting to be an unreliable affair and frequent mistakes are made by reason of the bell not responding to the station tender's touch below. To overcome this difficulty much labor has been expended in devising a system that would be accurate. So far the only practicable method found has been by means of electric bells, but these are also open to objection in wet mines, and mines where the copper water eats into the insulation of the wires.

Electro-Magnets to Move Heavy Metal Beams.

Electro-magnets capable of picking up a load not exceeding five tons are now used by the Illinois Steel Company in its works at Joliet to transfer iron or steel beams or plates from one part of the shop to another. The amount of electricity necessary to give a magnet enough drawing power to make a five-ton load adhere to it is only four amperes at a pressure of 240 volts, or about one-tenth of that required to move an ordinary trolley car on the level. The magnets used are in the form of the old-fashioned horseshoe. The poles of the horseshoe are 7½ inches apart and are connected at the upper end by a soft steel plate one inch in thickness. The poles themselves are each 10 inches long and are elliptical in cross-section, being 24 inches in depth by 3 inches in width. The upper 7½ inches of each pole are covered with coils of insulated copper wire, through which the current flows, to a depth of 1½ inches.

The working of the magnet is simple. When a plate or beam is lying anywhere else than where it is wanted the magnet, attached to the crane tackle, in place of the ordinary sling or hook, is lowered, and its poles placed on the load to be moved as near the center as practicable. Then the current is turned on and the underlying plate or beam is held fast by the magnetic attraction. The crane is then put in motion in the usual manner and the beam is transferred to the spot where it is wanted. When it is fairly placed in its new position, the current switch is turned off and the action of the magnet ceases. The only reason why such magnets have not been long in use is because of the fear that the load would drop if there was any temporary failure of the current. This is always possible, though it is becoming less so every day with the improvement in electrical apparatus.

To guard against accidents the insulated coils are enclosed in water-tight brass casing, and the whole magnet is covered in with half-inch steel. If the five-ton electro-magnets in the Illinois Steel Company's works prove a success when tested by long enough time, larger sizes will be employed. When used in connection with electric cranes, which are now becoming common, only two hand switches will be required to move iron or steel loads. Of course, loads of other materials could be picked up equally well by an electro-magnet, with a heavy keeper and a hook attached to it for the ordinary sling.

Telegraph and Telephone.

It has been thought by proprietors of telegraph lines that the telephone might prove a serious rival, not merely for such messages as might require a very prompt reply, but also for extended dispatches for news purposes. But a recent test of the telephone shows that it has its limitations. It will serve for short news messages, but not for long ones. In a recent local newspaper contest for news from the Klondike to San Francisco, a dispatch 10,000 words in length was handed by a messenger from a steamship to the manager of a telephone office 101 miles from the nearest available telegraph office for transmission to a still more distant point. Previous arrangements had been made for handling so long a report. A sending operator sat down at the telephone and began reading the message, while the receiving operator at the other end of the line wore on her head the apparatus usually employed in central stations. Her hand were thus left free, and she used them to manipulate a typewriting machine. Her copy was then handed to a telegraph operator to be sent to its final destination. It took five hours to send 10,000 words by telephone, thirty-three words a minute. There are machine telegraphic systems now in actual use which transmit at least one hundred words a minute; some of the new plans which have attracted attention within the last few years contemplate a speed of from one thousand to five thousand words a minute. The limit in this method would seem to be, not the number of words one can utter (from one hundred to two hundred a minute), but the dexterity of the typewriter. It is possible for an expert to write fifty or sixty words, but this is not to be compared with machine telegraphy.

Ore Hauling by Electricity.

TO THE EDITOR:—The standard gauge electric car line being constructed in Cripple Creek district probably will be the first application of electric power to the work of ore hauling. The line passes from the town of Cripple Creek up Poverty gulch, over Gold, Globe, Raven, Ironclad and Bull hills and on to Battle mountain and the town of Victor, and branches will extend to other parts of the district. Much of the distance from Cripple Creek to the summit of Gold hill and from Victor to Bull hill—the ascent—will be about a 7½ per cent grade. The rails being laid are the regular 60-pound T-rails, and the track is being well ballasted. There are many semi-circular curves of 100-foot radius. Besides the regular ½-inch copper trolley wire, there are ½-inch feeder wires being put up, which connect with the trolley wire at quarter-mile points. Each car will have two 50 H. P. motors. Special ore cars are being constructed for the line and will be on the hopper bottom plan. The line will be about twenty miles long, including the branches, and is being designed for cheap transportation of ores and passengers through the district. The track is now complete from Cripple Creek to Bull hill. Mr. L. D. Ross, one of the promoters, is managing the construction.

WASCOTT.

Cripple Creek, Colo., Oct. 1, '97.

MESSRS. SIEMENS & HALSKE'S latest process for the electrolytic treatment of zinc consists in the treatment of the blende with chlorine gas to complete chlorination, solution of the chlorides in water, and electrolysis of the solution. Metallic zinc is deposited and chlorine liberated, which is utilized in its turn for treatment of ore. The electrolysis is not carried so far as to effect a complete decomposition of the chlorides, on account of the cost of the electric energy required. But an excess of chlorine is provided in the solution by the addition of common salt, and undecomposed chlorides in the nearly spent solution are not lost since the solution is employed as a lixiviant for fresh lots of ore.—Industries and Iron.

THE Electric Vehicle Company has organized under the laws of New Jersey, with an authorized capital stock of $10,000,000, to manufacture and operate electric carriages to be propelled by storage batteries. The corporation proposes to establish branches throughout the United States.

A WRITER in a current magazine makes the prophecy that in 300 years from now the world will only know three languages—English, Russian and Chinese. The English language will be spoken all over North and South America, in Australia, India, Africa, New Zealand and the islands of Australasia and the Pacific. The Russian tongue will have conquered all Europe except Great Britain, and all in Asia except India, Chinese will hold sway over the rest of the world.

Mining Summary.

CALIFORNIA.

Alpine.

Peter Curtz of Markleeville has a company to spend $20,000 in development work, and it is decided to organize. All openings formerly made are now closed, and a great deal of work will have to be done to put them in working condition. The ore is low grade.

Amador.

The report of the secretary of the Potazuba Mining Co. shows that during the year the company has received $17,000 and disbursed $16,000, has $1000 on hand and is free from debt. The shaft at the mine is 530 feet deep and as soon as 15 feet more of the sump is finished drifts will be run from the 500 on the ledge, which promises to develop well.

Republican: At the Kennedy, at Jackson, they are sinking from the 2100 to the 2300 level. This is perpendicular depth, and is the greatest depth reached in gold mining in this State. While sinking is prosecuted in one shaft, the other is used for hoisting ore for the mill, which will be kept running to its full capacity. It is reported that in the event of the ore body showing the same size and quality at the 2300 level as at the 2100, the milling capacity will be doubled. The quartz is not of such high grade as that crushed in years past from the 900 to the 1500 levels, but is still of paying quality.

The Argonaut mill is nearing completion. In the mine a number of levels have been opened toward the surface, to prove the continuity of the ledge from its contact with the Kennedy vein to the surface. This work has reached a point only 300 feet from the surface, and it is to be continued through shaft and tunnel to the croppings.

The interests of W. N. Bardue in the Amador Queen No. 2 and mill site, also the Dewitt quartz mines, have been sold to a San Francisco company for $85,000. The first payment of $6,200 was made the past week. It is the intention to proceed with the development of these promising properties without delay.

The financial end of the Anita enterprise was improved last week, $10,000 being paid over to Mr. Bright on the bond and four months additional time given on the balance. Development work will now continue without interruption.

At Amador Queen No. 1 a depth of 1000 feet is contemplated at this mine which leaves 275 feet more to sink. The object is to go deep enough to avoid the break in the ledge caused by the deep gulch. At the 500-foot level a crosscut 300 feet in length has been made, and drifting for the ledge is going forward.

The Bellwether is about free of water and sinking will go on.

The Oneida mine has a full force engaged in sinking and the work will continue until the shaft reaches a depth of possibly 2000 feet.

Butte.

A rich pay shoot is reported in the Carlisle mine

Twenty men are employed in the South Thermalito mines, sinking shafts.

Calaveras.

A Mokelumne Hill dispatch says that on the 13th inst. an old resident was arrested charged with having fired the 20-stamp mill and hoisting works of the Moser and Roanoake mines, which were destroyed by fire last Sunday, $25,000 worth of machinery and 15,000 feet of lumber being burned. The Moser and Roanoake mines were discovered in 1891 by S. S. Moser, and were bonded to the Stockton capitalists, West & Sperry of Stockton. The mine was discovered by drifting a tunnel through the rim of a gravel channel in expectation of making a placer mine. The Moser has been worked steadily up to six weeks ago, when the mill was closed down, and only a small force of men were employed sinking in the Roanoake shaft.

At the Keystone mine near Altaville, Chas. Lillie superintendent, the shaft is unwatered and will be 200 feet deep before running crosscuts.

At the Gwin mine the large air compressor is in position and the pipes are nearly all laid for the water and air, and the pumps are on the ground all ready to put in the mine as soon as the compressor is completed. The engines for the south shaft are on the ground and will be put in position in a few days. The 40-stamp mill is kept running steady crushing 150 tons per day. The face on the north and south 1400 is very large, over 18 feet between walls.

San Andreas *Prospect*: A. B. Thompson, superintendent Jupiter Mining Company, E. H. Binns and C. W. Cross have bought the Scribner placer mine and Bund's San Domingo for $18,500. Two hundred and fifty men are at work under Superintendent Thompson constructing a ditch twelve miles in length to take 2500 inches of water from the San Domingo creek at Maccaroni Flat to the Jupiter mine to be used in hydraulicking, and expects to turn water on the bank early in December.

El Dorado.

Nugget: Lieut. Deakyn, of the Debris Commission, has examined the restraining dam put in by J. C. Murphy at the Slate Creek mine. It is the same dam used by Mr. Murphy to restrain the tailings from his Big Chunk mine, which he has been working the past two years, and from which he has taken upwards of five thousand in nuggets, the smallest of which weighed $30 and the largest $1,065, to say nothing of fine gold. In working the Big Chunk, Murphy uncovered a 5-foot quartz ledge which prospects well, and which he proposes working later on. After examination, the Debris Commissioner decided that the one dam was sufficient.

Nugget: The Grizzly Flat gravel mine, A. A. McDonald superintendent, employs thirty men. The Eagle King, owned and worked by John Melton, is running full-handed.

Kern.

Ledges in the Goler placer district are being uncovered; some prospect free gold. Superintendent Coplin of the Visalia Company is sinking a new 14-inch well at the Rand mill. The Rand Company has two mills running day and night on ore from their mines. Considerable assessment and development work is being done on claims east of Garlock. Webb & Harney have started up on the Hard Cash mine. Rose & Co., who bonded the May Queen mine of Kelley & Price, have paid $3000, the balance of the bond, although it was not due until Jan. 1, '98. They have twelve men at work and will put in a hoisting plant. A. D. Glace of Golden Gate has bonded from Clifton & Barman the Galena City, Dell and Modoc claims, near Garlock, for $15,000, on which the first payment has been made.

Postal Inspector Flint says that within three months Randsburg will be a Presidential postoffice. In order to attain this standing it is necessary to show receipts amounting to an annual income of $1900. Although Randsburg has been in existence but a year, it already shows receipts of $1700 and a rapid and steady increase.

Mariposa.

(Special Correspondence).—On the 1st inst. the California Exploration Co. took over the Virginia mine, which has been worked under a bond since the first of the year. This mine, one of the oldest in the Coulterville district, covers about a half a mile of the east branch of the mother lode, and is about a mile southeast of the Merced Co.'s Mary Harrison mine. The Virginia was extensively worked under bond many years ago by a man named Coe, who cleared about $100,000 from his operations, but dropped the property on account of pending litigation. The mine lay idle till three years ago, when it was purchased by O'Toole & Arnhold for rather less than $5000. Last year it was partly reopened under a bond by Clarence King. The present purchase price is not stated, but at the time the bond was given the consideration was announced as near $80,000. The development on the mine includes three tunnels on the vein with a length of 1200 feet and a shaft on incline to a depth of 400 feet, with extensive drifts. There are also several smaller openings on the mine and an old 8-stamp mill in fair condition. The Exploration Co. will at once begin the erection of a 10-stamp mill on the site of the old one, and has already begun work on a timber dam to impound the waters of the gulch for milling purposes. New hoisting machinery will also be placed at the shaft. The new owners have also a bond on the Parker and Austin claims, adjoining on the south and covering 3000 feet more of the ledge.

There are persistent rumors, which cannot be verified, that the Merced Mining Co. is about to install an electric power plant. It was the original intention of the company to operate by transmitted electric power, and to this end the Golden Rock ditch on the south fork of the Tuolumne river was purchased. This ditch formerly supplied the placer mines of Big Oak Flat, Garrote and Horseshoe Bend with water, but has been idle for fifteen years or more. By rebuilding the first ten miles of the ditch a fall of 2000 feet can be had back into the Tuolumne river at a point about fifteen miles from the company's mines. In view of the statement recently put out by the Boston office, that but $20,000 remained in the treasury, it is not thought active construction can begin till further financial arrangements have been made. There are a number of available sites near Coulterville for electrical power plants, and the carrying through of an enterprise of that sort would give a great impetus to local mining matters.

Coulterville, Oct. 13, '97.

Talking of the Mariposa grant Senator Jno. P. Jones is reported to have said in New York this week that "we are just now getting everything in shape to do big work there. A big dam will be built on Merced river to furnish, if needed, power for running the varied machinery. We will go and go in big. There is no use taking hold of a proposition of that kind unless it is done right. We have been getting in shape to do it right. There are a great many mining properties on the Mariposa grant, some of which we think are big. You have heard that the Rothschilds are interested with us up there. They own one-eights interest. Mr. Mackay also owns an eighth, while myself and friends own the rest. We expect to begin almost immediately to build the dam. The development of the property, the handling of the ore and everything connected with the project will be carried on on an extensive scale. We will get to work on our Mariposa property as soon as we complete some little details. That will be very soon." All of which has been said before.

Gazette: About twenty-seven men are employed at the Mount Gaines mine near Hornitos. The ore is being hauled to the Horseshoe mill.

Mono.

Bridgeport *Chronicle-Union*: D. E. Jones has been appointed superintendent of the Jordan mines—the Golelo, Montecito, and Sterling, and has started work to take out 400 tons of ore to put through the new mill. Mr. Jones intends to work the legitimate gold ore of the mines and leave the manganese and copper ores for further tests, and is satisfied that he can make a success of the next working.

Nevada.

(Special Correspondence).—On the Bellefontaine, three miles east of town, the company has reached 320 feet on a drift north, at 320 feet depth. They expect to cut the chute within 25 feet. The ore (a 20-inch ledge) runs from $25 to $50. There is a 2-inch sulphuretic streak on the footwall—smelting ore that runs $252. The property is owned by local and Sacramento people.

In the Maybert district Baron Von Schroeder has pumped the Blue Belle, 600 feet deep, with a view to resuming development work. The property has been closed six years.

Successful work continues in the development of the Governor Morton by Richie & Foster.

The Blue Jay Company (Bonney & Baugh) have resumed work on their property.

Turner & Richards, owners of the Gray Eagle, adjoining the Blue Jay, made a crushing recently that netted them $11.

Grading for a 10-stamp mill has been started on the Last Chance, comprising five claims.

J. A. Lipman, who with ten others leased the Eagle Bird, began work a week ago, sinking from the winze to connect with the 600 level. This property has been closed eighteen months. There is a 30-stamp mill on it. The ore averaged $5.75 per ton. The formation is granodiorite.

Nevada City, Oct. 11th, '97.

(Special Correspondence).—The old Dromedary, situated on the creek adjoining town, is about to be reopened. Preliminary work has already been begun.

Dr. W. C. Jones & Son will reopen an old property three miles north of town. The shaft was abandoned forty years ago. It has a 4-foot vein of ribbon rock highly mineralized.

The Rockland has been pumped to the bottom, 300 feet, and a contract has been let to sink 200 feet.

On the Orleans since placing electric motor and power drills, less than two weeks ago, they have driven 44 feet on the 800 north and 47 feet in the hanging wall crosscut. A saving has been made over the hand-power work, including surface labor, of $10.05. The company will run another 50 feet before stoping. The indications are quite favorable.

The new shaft of the Omaha Consolidated is now making excellent progress, which was considerably handicapped at one time. The old shaft, long years idle, of the Homeward Bound, some 600 feet adjacent, was reopened and two pumps lowered, and the surrounding country for considerable distance is being rapidly drained, which alone made it possible to resume work on the new shaft. The Omaha Consolidated is to-day a plant of large proportions, and the system of the management in every detail is admirable.

Grass Valley, Oct. 12th, '97.

The Last Chance Con. M. Co., incorporated Sept. 15th, capital stock, $500,000, W. F. Barnes secretary, has under bond seven mines with ore showing values of $3 to $15 per ton, in Diamond Creek mining district, nine miles from Emigrant Gap station. The company proposes to build a 10-stamp mill.

The Cadmus and Home mines, on Deer creek, below the Providence, have been idle, the water supply running short. They will start up again when the rains set in.

The *Telegraph* says: The North Bloomfield Mining Company have bought the Quick property at Badger Hill.

Placer.

At Blue Canyon the Alder Creek G. M. Co. will replace its 3-stamp mill, used only for testing and prospecting, by a 10-stamp mill, which will be built at the mouth of the lower tunnel, a crosscut cutting two quartz veins. The first of these was reached 78 feet from the mouth, and the tunnel has been run 75 feet farther toward the second vein, which, it is expected, will be cut within the next 150 feet. The lower tunnel is perfectly straight and well timbered throughout, and is situated 130 feet below the upper tunnel. This will be the main entrance to the mine, and the mill will stand within 100 feet of its mouth and will be run by water power.

The Lost Camp hydraulic mine has had its new impounding dam accepted and has been granted permission to hydraulic.

The Redstone mine is doing developing work, stoping ore and running the mill.

Sentinel: The electrical machinery for the Hidden Treasure mine is in successful operation. The blower which forces the air into the mine has been started. The electric locomotive will soon be in active operation.

The Truro gravel mine has been shut down for the present.

Argus: Hoffman, Bowers and Outhouse, on the Baker divide twelve miles from Forest Hill, intend to sink a shaft 200 feet in the hope of reaching the main gravel channel, and if they succeed big pay is practically assured them. The Hidden Treasure Mining Company expect to have the electric plant at the Dam claim at Centerville in full operation in two weeks. The La Trinadad mine in Sailor canyon, which is worked by members of the Salvation Army, is rapidly becoming a good producer. The Red Point mine, J. A. Ferguson superintendent, is running a big force of men, and it is said that very rich gravel is now being extracted. The Valley View mine, near Lincoln, is about to resume operations. T. G. Durning, formerly of the Gray Eagle, is superintendent. The Baccaratt mine, about two miles from Lincoln, will soon be running in full blast, the company now in charge of it having made all the improvements necessary to push development work.

Plumas.

On the North Fork A. N. Cameron, in the channel in the Cameron drift mine, is taking out between $60 and $80 per day.

National-Bulletin: The Plumas Imperial mine, owned and operated by C. D. Hazzard, is not washing gravel steadily now. The fall rains will soon permit the operation of the mine. A notable change in the character of the gravel deposits is observable. The firmly cemented gravel wash then contended with has given way to that of a soft nature which yields readily to the large stream of water thrown from a 6-inch nozzle. The gravel is estimated to be about 85 per cent of the 100-foot bank. The gravel deposit of the soft nature is widening out, as development work progresses, across the channel, which is estimated to be 1200 feet wide from rim to rim. The portion of this deposit now being worked is rich in gold, indicating that the Plumas Imperial is developing into one of the large and valuable gravel mines of the State.

Riverside.

Gold is reported discovered in Mill Creek canyon, near Redlands, which goes $75 to $150 a ton.

San Bernardino.

Near San Bernardino a plat of ground has been purchased, equally distant from both railroad depots, on which is to be erected the smelter now located at San Fernando.

G. L. Brown, manager of the Logan Gold Mining Company at Victor, reports that twenty men have been working the Calori group of mines in Rattlesnake canyon, near the Rose mine, and have uncovered a large body of ore which will average $20 in gold per ton. The company will put in a power hoist and a revolving roaster of twenty tons capacity.

Sun: The Lytle Creek Quartz Mining Co., capital stock $100,000, all subscribed, is incorporated to mine a ledge of cobalt at Colton, in Lytle Creek canyon, six miles north of the hot sulphur springs, 6,000 feet in length and from 10 to 20 feet in width. It assays 30 pounds of cobalt to the ton, besides low-grade gold and nickel. A smelter of ten tons capacity will be put up at the mine. This is the only known mine of cobalt in the United States.

[Cobalt is not uncommon in the United States, as high as 13,000 pounds having been produced in one year. It usually occurs in connection with nickel ores. The total world's production is about 250 tons annually. Its principal use is in the manufacture of a blue pigment. At present it is worth about $1.50 per pound.—EDITOR.]

San Diego.

J. P. Frizell, who has a lease on the south extension of the Escondido mines, is taking out some rich ore. He is running a tunnel from the west side of the hill to connect with the old diggings on the east side, where he has men stoping in rich ground.

C. W. Witham & Co. have located some new copper claims joining the old Encinitas copper mines, and will build a dam 60 feet high for reservoir purposes, The *Union* says they intend to put in a smelter.

Mining and Metallurgical Journal: Speaking of the mines at Hedges, C. W. Pauly said recently: "The mines are in good shape. We have been running 50 of the 140 stamps until recently, and are now running 70. The gold is taken from the Cross and Crown mine. The rock runs about $8 per ton, and we crush 240 tons per day. Just before I left we made a very satisfactory clean-up. Between 100 and 200 men are at work, partly Americans and partly Mexicans. The Americans do the expert mining, and the Mexicans shovel, cut wood and do purely manual labor. The wood is found on the desert, twelve or fourteen miles from camp, and it sells by the ton, instead of by the cord. We pay $4 per ton at the scales. It is ironwood, very hard and good fuel. There are about 400 people in camp and about 100 more in the vicinity. All are dependent upon the mines for support."

Sierra.

Standart & Horwege are opening a gravel mine two miles above Pike City.

Siskiyou.

Wm. Kline of Sawyer's Bar has sold his mine at the mouth of Jessup's gulch to the Salmon River Hydraulic Mining & Ditch Co., and the company will extend their ditch to the claim.

Journal: At the Klamath River Flume & Mining Company's property work will soon be resumed.

The Chicago Mining Company, four miles from Cottage Grove, is building a ditch, and expect to start up about the first of December. This will be one of the largest mines on the coast when in operation.

The Minetta B. mine, on Thompson creek, is in operation, running with a small head of water.

Satisfactory results have been achieved in the quartz mines in the Humbug district during the past year, and we may look for the erection of quartz mills on some of the ledges next season.

J. F. Boyle has begun work on the Boyle mine, on Humbug, representing O. Howard of San Francisco.

The Klamath River Dredging Company's dredger is still working below Oak Bar and paying well.

Trinity.

The first payment was made this week on the purchase price of three gravel mining properties located near Douglass City, Trinity county—the Vitzhum Gulch, Union Hill and Dutton Creek. The purchase includes a ditch and water rights, the price for which as agreed upon is $100,000. The buyer is Alexander Hill for himself and English capitalists.

Nine miles from Trinity Center is the McLeod mine, where the greatest quartz strike in the county has recently been made. Development work had progressed sufficiently to justify the erection of a stamp mill. A foundation for the mill was commenced when a ledge larger than the one in the tunnel was uncovered. The millsite was moved 50 feet and work commenced again. This time a larger ledge than either of the previous ones was brought into view. These strikes are all on the 73-foot level. Buildings are now being completed so as to admit of work being prosecuted all winter. A tunnel will be run in on the 250-foot level this winter. The ore in the tunnels is principally talc, while that uncovered in the open cuts or foundation work is a hard blue and white quartz, much resembling the serpentine rock (so-called) found in Siskiyou county.

Tuolumne.

(Special Correspondence).—Gov. Machin has resumed work on his claims on Moccasin creek at the foot of Priest's hill. D. R. Oliver & Co. have begun work on the Black Warrior

and adjacent claims on Moccasin creek, near the Tuolumne river.

Soulsbyville, Oct. 14, '97.

The Ribbon Rock G. M. Co., near Carter's, has acquired and is developing six claims, the former property of the Seminole Co.

Democrat: At the Montgomery Supt. J. E. Summers has miners sinking a working shaft directly on the vein.

A new hoist is being put in at the Golden Gate mine.

The old shaft on the Uncle Sam is being retimbered, preparatory to resuming operations. The mine is owned by Robt. Marshall.

The Tarantula is continually being improved with machinery, etc. The new hoisting works will soon be running, and the two ledges of $80 rock made to show their worth.

On Thursday a sack of fine milling ore from the Pennsylvania was shipped to San Francisco that assays $350 per ton. There is said to be plenty more just like it at the mine.

The new hoist at the Arbona is fast nearing completion, and will be running in about two weeks.

At F. Cullers' East Belt mine near Cherokee—the Little Beauty—twelve tons run through the mill yielded $1800 in gold. Work is confined to drifting on the vein.

At the Gold Bug the main shaft is now down 80 feet, with further sinking on every shift. The new steam hoist works admirably. Thos. Whitto is superintendent.

In the Yellow Jacket advantage is being taken of the shortness of the water supply to timber the shaft and do necessary grading for the powerful hoist that will be shortly placed on the property.

Driving in the tunnel to tap the Blue lead on the Traylor mine, above Arrastraville, has progressed to the extent of 473 feet. Supt. J. L. Tonkins states that he hopes to tap the ledge in 60 feet more.

The Rising Sun, owned by a corporation, which has lain idle a long time, will soon be running. J. L. Tonkins is superintendent.

Independent: At the Pennsylvania mine, near Cherokee, a 22-inch vein recently struck has caused a stir in that vicinity and mine owners are more confident than ever of the productive quality of that section. J. Newton is the superintendent.

At the Providence carpenters, miners and surface laborers are busy. A road to the mine is being opened, and a ditch dug. It is the intention to sink a three-compartment shaft. G. Odgen is the superintendent.

At the Consuello prospecting is being vigorously driven ahead and good rock is being taken out.

Superintendent Sharwood of the Grizzly is pleased with the quality of ore taken out. Of the contract to sink 400 feet, 200 feet has been accomplished.

At the Montgomery an 18-inch vein has opened in the bottom of the shaft that tests $35 to the ton. They are in 50 feet. John Summers is the superintendent.

At the Yellow Jacket miners are working on $200 rock taken from a 2-foot vein.

At the Crœsus Superintendent Winwood is having the 50-foot shaft of this mine cleared and the water pumped out. A vein 9 inches wide has been exposed that milled in early days $50 per ton.

Yuba.

The Orient gravel mine has fifteen men running a tunnel to tap the channel near Camptonville. The Grizzly Hill mine is being opened up by a San Francisco company, E. C. Cochran, superintendent. The Tippecanoe, which formerly was worked as a hydraulic mine, is now to be worked as a drift mine. Nine men are at work there, but the force will soon be increased. The Brush Creek mine, above Camptonville, is being opened up.

NEVADA.

About 8000 tons of ore is reported to have passed through the De Lamar mill at De Lamar in the month of September.

The Wilson mines and tailings at Pine Grove have been bonded to Joseph Smith of Salt Lake for $31,000, the final payment to be made in June, '98.

At the annual meeting of the stockholders of the Comstock Tunnel Company in New York on the 11th, Franklin Leonard was practically re-elected president. He is understood to be desirous of engaging in such enterprises as that offered by the American Flat Development Company. It is thought that the proposition submitted to the tunnel company some time ago by the American Flat Development Company will be accepted.

The *Central Nevadan* says: W. E. Dean came up from San Francisco last Wednesday and gave orders Thursday to discharge all the men, numbering some twenty-five or thirty, and closed his property at Dean for a few months. The once prosperous little mining camp of Dean is now almost deserted, most all of the men and their families leaving for other fields.

Upon the reading of recent investigations in western Nevada by Charles D. Walcott, director of the United States Geological Survey, before one of the leading scientific societies of Washington in November last, the query was asked: "Is not Nevada a gold State rather than a silver State?" Recent developments point that way. From Lincoln county in the far south to Elko's line in the north, and Esmeralda in the west, comes news almost daily of the output of some promising gold property or the discovery of a new lode. De Lamar, a camp comparatively unknown in 1894, is now one of the leading producers of gold on the coast. White Pine county is enjoying the investment of capital in its numerous gold deposits, and Elko is having its share. Washoe, the agricultural county, has her leading papers proclaiming recent gold discoveries; Douglas with her rich placers, Lyon with the same, besides rich copper veins, upon which the 40-ton smelter of the Boston-Nevada Compay blew its inaugural whistle last Wednesday; Esmeralda showing every indication of reviving the days of Aurora, together with Storey having already produced $800,000,000 in gold; Nye, Churchill and Humboldt, all producers, makes the above assertion true in every respect.

New York men are examining the Oest gold mine at Silver City, Lyon county, and negotiations for a sale are pending. The price asked for the property is $250,000.

Walker Lake *Bulletin*: John W. Mackay, who is reported to be interested in a project to buy the Blair mines at Silver Peak, returned from the mines last Monday, after a week's examination of the property. The great miner did not seem to be at all enthusiastic over the outlook at the Peak. In answer to a direct inquiry as to what he thought of the mines, he said: "There is a big country and there seems to be lots of quartz. But the quartz is low grade, and it will require the outlay of a large amount of money before anything can be realized. The conditions at Silver Peak are all unfavorable for cheap mining and milling. Wages are high, supplies are high, transportation charges are high. I visited the Peak on the invitation of friends who think of buying the mines. I cannot say whether the sale will be made or not."

Mr. Mackay has come and gone and nobody is much the wiser, and whether the mines are to be sold or not is still a mystery. Mr. Mackay goes to California, where he will remain two months. He will not return to the Peak. L. E. Hanchett accompanies Mr. Mackay to San Francisco, but will return in a few days.

Dayton *Times*: The Peck plant started up this week Monday, and is now running on the Douglass reservoir tailings. About 200 tons a day are being hauled and worked. Twenty-five men find employment in and about the mill.

OREGON.

W. J. Conners, superintendent Golden Star G. M. Co., says the 10-stamp mill on the California mine at Cable Cove, near Baker City, will begin work Dec. 1st.

Campbell Bros. of Port Blakeley, Chilcott of Seattle and Behrman of Port Townsend, Wash., have bought the entire Black Butte bunch of quicksilver claims in southern Oregon—320 acres—and completed arrangements to begin operations.

WASHINGTON.

The Troublesome Creek Mining Company's property has been sold to a German syndicate represented by E. Haber, being three groups of claims on Troublesome creek—the Daisy, Great Scott and the Minnie—for about $100,000; 10 per cent has been paid. Development work has begun. The properties are fifteen miles from the Great Northern road and a railway will have to be constructed. The company will erect its own reduction works there.

BRITISH COLUMBIA.

(Special Correspondence).—Mr. Parke of Vancouver has invented an amalgamating machine for which he claims wonders. In the presence of the MINING AND SCIENTIFIC PRESS correspondent this week, 28 cwt. of ore was crushed to 40 mesh and was put through the machine by a stream from the city hydrant in forty-five minutes. The rock was washed down a feeder into the quicksilver box, where it was forced through the quicksilver—500 pounds—by means of steam, then up to a matted rocker to the tailings tank. The rock, which was from the Fire Mountain mines—free-milling properties of Harrison lake, near Westminster City—assayed ounce by ounce as it was put into the feeder, went $82 in gold. The brick retorted from the "quick" weighed 5 ozs. 12 dwts. 10 grs. Ten per cent of the total value was lost in the tailings. Mr. Parke claims if the rock had been finer he could have saved over 95 per cent.

Mr. Remington of Salt Lake City has his smelter offer now before the council. He offers to erect a $1,000,000 smelter for a bonus of $100,000 on the basis of $1 a ton for the first 100,000 tons smelted. Harry Symonds, Q. C., representing an English syndicate, offers to erect a $1,000,000 smelter for a bonus of $65,000 on a basis of $1 a ton for the first 65,000 tons smelted. He further offers to transfer to the city in exchange for the bonus $65,000 worth of the capital stock of the company, to deposit $5000 as a guarantee of good faith and to pay the expenses of submitting a by-law to the rate-payers. Mr. Remington, who is on his way to British Columbia, will no doubt come down in his demands when he hears of the Symonds offer.

The Golden Cache mill, Cayoosh creek, started up three days ago. Before this appears in print the first clean-up will have been made. The result is watched with great interest, as the Golden Cache free-milling proposition is the most talked of mine on the seaboard.

The Athabasca of Nelson, owned here, shipped 100 tons of free-milling ore to the Hall smelter during September in three lots. The first went over $80 in gold, the second $96 and the third results just to hand show gross returns of $106.30 per ton. Regular shipments will be made hereafter. The mine is now on a dividend-paying basis.

The Channe Company of Vancouver have recently purchased the following claims and are developing them: The Old Hat, Phillips' Arm, seventy miles north of Vancouver, surface assay, copper, $45; the Centerer, East Kootenay, 7-foot vein, surface assay $59, mostly copper; the Maple Leaf, East Kootenay, 3½-foot vein, $34, all values; the Book Rest, East Kootenay, surface gold and silver $194; the Golden Hope, East Kootenay, $75 on the surface.

Vancouver, B. C., Oct. 10th, '97.

(Special Correspondence).—The C. P. Railway is pushing along the location of its line from Robson to Rossland by way of China creek. Construction of this road is soon expected, and the terminus at Rossland is to be in the hollow immediately south of town.

The chief mines now under active development in the Rossland camp are the Le Roi, War Eagle, Centre Star, Iron Mask and Sunset No. 2. These are all in a position to ship ore at present rates. However, much of the work consists of blocking out ore for some time in the future, when transportation rates become reduced. The advent of the C. P. Railway may accomplish this by entering into competition with the Columbia & Western Railway, which now charges $2 per ton for carrying to Trail smelter, a distance of eleven miles.

The Hall mines are about to declare their first dividend. For the last two years they have been heavy producers of copper matte, but the management and the equipment have been very expensive. Their ore body produces somewhat over 100 tons of crude ore per day, the values of which have lately been increasing.

Compared with this time last year, the travel throughout West Kootenay is very light. There is practically none of the "boom" element left, and the camps are settling down to a business which the adjacent mines will support. This will account for the return of some discontented business men to their former homes. Those who stay will build up upon a fairly solid base due to production of ore.

The Canadian representatives of the "New Gold Fields of British Columbia," headed by Sir Charles Tupper and Sir McKenzie Bowell, both late premiers of Canada, are at present making a tour of this district, inspecting some of the company's properties, chief of which are the Exchange group, a silver-gold dry ore mine in the Slocan, and the Velvet, a copper-gold property on Sophie mountain, some ten miles west of Rossland.

In the granite dry ore section of southern Slocan small shipments of exceptionally rich silver-gold ore are being made from the Howard Fraction, Arlington, Two Friends, Meteor, Evening Star and Chapleau. These mines are being run in a small way and will never employ a great number of men, but continue to furnish ore which is rich enough to pay high cost of packing down. There is some probability of a custom mill being established on Lemon creek. The ores appear to be capable of some wet process which will treat the second-class quartz now thrown aside.

The Canadian Geological Survey Department are just publishing a map and report of the Trail-Rossland section. This should be of great use, as their maps—such as the ones of the Lake of the Woods and Yukon country—have proved most correct; besides which the reports enter into the detail of the geological facts of the district, and such facts are of no small economical value to miners and prospectors. Another map and report of Slocan-Ainsworth divisions is to be published about Christmas.

The Kootenay Electric Power Company are busy at the construction of their large system which is to supply electrical power to southern Kootenay from the station at the falls of the Kootenay river, half way between Robson and Nelson.

As usual at this time of year, there is an increased haste and activity in railway construction. Five thousand men are working on the Crow's Nest Railway. Surveys are being run west and south of Robson by the C. & W. Railway and the C. P. Railway; also the Slocan river branch line is near completion. Besides these, it is said the C. P. Railway contemplate establishing a system of tramways to tap some of the principal Slocan mines at present being served by the independent Kaslo & Slocan Railway.

Rossland, B. C., Oct. 16, '97.

The deal which was made some time since by which the R. E. Lee, Homestake, Maid of Erin and Gopher mines of Rossland were combined and sold to an English syndicate, under an agreement to put $125,000 in the treasury of the company, has been hanging fire. D. M. Linnard has gone to London to arrange matters and is confident of success.

Jas. Champion has charge of work at the Cariboo Gold Fields, near Ashcroft, and has 100 men at work building a ditch, capacity 2000 inches of water. It is 9 feet at the top, 4 feet at the bottom and 2½ feet deep, a grade of 9.60 to the mile. The drain tunnel is in 2700 feet. It is expected about 120 feet more will be driven before it will strike the elevator shaft. The elevator shaft will be driven about 68 feet, at the foot of which bedrock is expected to be struck. The shaft is sunk at an angle of 30° for the water pipe to go down to connect with the elevator shaft. At the elevator shaft a double compartment sluice is being constructed at a height of 20 feet above the present surface of the creek, 840 feet in length. The double sluice will be used for the double line of pipe for the use of the two elevators set and in readiness for active work next spring.

Golden *Miner*: The black sand found in the Saskatchewan river near Edmonton, in the district of Alberta, has proved to be rich in gold. It looks like a mixture of black and gray sand mingled together, impregnated with tiny pebbles and minute pieces of rock. It is very heavy, is found in the bed of the river, and the area is some miles in extent. The deposits are renewed by successive floods when the waters of the river become high. Several companies have been formed to treat this sand. Crushing, amalgamation, or extraction by means of quicksilver have been attempted. This process has not been a complete success. Another process has been roasting and smelting. The assays go as high as $400 per ton. There are millions of tons. The searcher after wealth among its particles is so busy with the solution of this problem, that he does not pay much attention to the question—where does this gold come from?

ALASKA.

The delta at the mouth of the Copper river is thirty-five miles wide, and the tide ebbs and flows for twenty-five miles up the river. Then it becomes necessary to make three short portages, together about one mile, after that the river is navigable for small boats for seventy miles, although the water is rapid and rocks abound. At this point on the river is a canyon five miles long; there is a portage around it, which can be covered in two and a half miles. This brings one to the junction of the North and South forks of the Copper river, which is named Tarral. Back on the divide which separates the two branches of the Copper river is an active volcano. This is supposed to be the source of the copper which is found so plentifully in this district.

Juneau *Record*: Large quartz ledges of a grade equal if not superior to the Treadwell have been discovered on the divide between Cassiar and the headwaters of the Yukon emptying into Teslin lake. The development of these mines is now impossible owing to lack of facilities for the transportation of machinery. With the building of the proposed Cassiar Central & Teslin Lake Railroad by the Canadian Government these difficulties will vanish. The Government's surveyors are now at work on the Stickeen river and their report is looked for at an early date.

THE KLONDIKE.

The vexed question of transportation across the Chilcoot Pass is to be solved. An enterprise was organized last week by a strong company at Tacoma, Washington, under the name of the Chilcoot Railroad & Transport Co. The men at the head of this enterprise are largely connected with the Northern Pacific Steamship Company and the Washington & Alaska Steamship Company. They propose building a surface tram road, commencing at tide water at Dyea, extending up an easy grade for a distance of eight miles, at which point a wire rope aerial tramway will begin. This surface road will be equipped with cars, to be drawn by horses. The aerial tramway will extend from the point mentioned up through the Chilcoot Pass and over the summit down to Crater lake, which is the most southerly of the chain of lakes connected with the Yukon river. The aerial tramway will be built in two sections—the first section being four miles in length and the second section (which passes over the Chilcoot Pass) being three and a half miles in length. Mr. N. M. Bell, the San Francisco agent of the Trenton Iron Works, Trenton, N. J., has returned from Tacoma, where he closed a contract for furnishing the material and machinery needed for this tramway, which will be the Bleichert system of double-rope tramway. It is expected that this road will be in operation by January 15th, '98.

The following is a copy of a bill of goods, stating amount and prices, which was purchased in Dawson City from one of the post traders in August, and shows the current prices at that date:

100 lbs. bacon	$ 44 00
200 lbs. flour	24 00
50 lbs. beans	6 25
50 lbs. sugar	15 00
24 cans milk	12 00
10 lbs. peas	12 50
15 lbs. coffee	7 50
12 cups	4 00
12 plates	6 00
20 lbs. rice	5 00
10 lbs. salt	1 00
2 cans pepper	1 00
12 cans butter	18 00
2 frying pans	3 00
1 case L. tongue	12 00
1 case R. beef	9 00
6 blk. codfish	3 00
1 case tomatoes	10 00
55 lbs. ham	24 75
10 lbs. oatmeal	2 50
30 lbs. potatoes	6 00
6 cans B. powder	4 50
4 cans cocoa	3 00
20 lbs. crackers	5 00
1 can opener	50
6 pkgs. matches	75
2¼ lbs. candles	1 00
Total	$241 25

Ex-Gov. Swineford says: "You can say to anybody who thinks of going to Klondike that they will have a pleasant time of it if they live to get there. After they have been there three days they will begin to draw comparisons and wonder what kind of a paradise hell is, anyway, compared with that country. The result will be much the same whether they arrive there in the summer or winter. The fact is that the upper Yukon shows the greatest extremes of heat and cold that are shown anywhere in North America. In winter 30 degrees below is mild, the thermometer reading as low as 80, while during the months of June, July and August it gets ambitious and climbs to the top of the tube, ranging from 110 to 130. One can protect himself from cold, but it is impossible to do so against excessive heat, accompanied by the plague of mosquitoes, deer flies and other winged pests."

The usual contradictory columns of newspaper reports from the Klondike are published. Nothing has transpired during the week that adds to what has already appeared herein. Several letters from Dawson to hand are merely a repetition of what has already been said.

UTAH.

The following description of the Golden Gate mill is from the Mercur *Mercury*: The site, not including the gas plant, covers a ground space 300 feet wide and 400 feet long, and is composed of eight levels, supported by solid walls of masonry, some of which are 40 feet high. The top or crusher level is 75x25 feet in dimensions. The ore, coming up through the incline, which leaves the working shaft at a point about 60 feet below the surface of the ground, passing under a corner of the mill and emerging above the first level, is dumped automatically into the crushers, where it is coarsely crushed and runs into a bin with a capacity of 2000 tons. Above this level—100 feet—is the shaft-house containing the air compressor and hoisting engines, which lift the ore from the bottom of the mine to the top of the mine. Above it also runs the great flue, which comes from the furnace levels below, connects with the dust

chambers, runs up the hill for 200 feet and is crowned by a perpendicular stack 97 feet high. This flue, inside dimensions, is 7x9 feet. The second or drier level, having a foundation wall of solid masonry 40 feet high, has a floor space 75x82 feet. This level will have two driers, 80x16 feet each, which are connected by flues, 4½x6 feet inside, with the main flue. After the moisture is expelled by the driers the ore passes automatically to the third level, where all the rolls, screens and elevators are situated. This level is 90x68 feet, and here the ore is finely crushed and screened and passes into a second ore bin, 25x84 feet, capable of holding 2000 tons. This ore bin rests on three solid walls of masonry. Under this ore bin is the dust chamber, which is 100 feet long and 10x11 feet inside dimensions. This chamber is connected directly with the main flue, and is provided with hoppers 12 feet apart the entire length. The floor is so arranged that the dust collects at the mouth of these hoppers, so that it can be drawn off into cars below without shutting down the plant for an instant. A door also connects with the main flue at this point, at which all dust accumulating therein may be drawn off in the same manner as from the hoppers in the dust chamber. From the third level the pulverized ore goes automatically to the fourth and fifth levels directly to the roasting furnaces. Each of these levels cover a space 298x83¼ feet, and on each rests two furnaces 135 feet long and 16 feet wide. Under the furnace levels are two flues 75 feet long, 6x8 feet inside, connecting with the main dust chamber and running under the ends of the furnaces, with which they are connected. These furnaces have a capacity of 500 tons a day, and here the ore is parted from all arsenical and other minerals which interfere with the treatment by the proposed process. The sixth level, which covers the same space as the fourth and fifth, is left blank. It is made for the purpose of adding two more furnaces, when it becomes desirable to enlarge the plant, and by this arrangement the addition can be made without stopping the mill for a day. After going through the furnaces the ore drops into a hopper excavated from the fifth level, which is connected with the seventh level by a tunnel which runs under the fifth and sixth levels and comes out at a point above the tops of the tanks on the seventh floor. Until the hopper is reached the ore has been handled automatically. Here the ore is drawn off from the hopper into cars and run out over the tanks on the seventh level and dumped into them. The tank room has dimensions 298x60 feet and the tanks are supported by a solid retaining wall and 230 heavy piers of masonry, which go down to the living rock. This floor will contain ten tanks of a capacity of 200 tons each. Above them on the same level will be the solution tanks and running over them will be four lines of track for the distribution of the ore, while running under these the entire distance will be four more lines of track. On the latter will run the cars which will receive the tailings, to be drawn from the bottom of the tanks. The tailings can be dumped at both ends of this level and ample space has been left for more tanks if found necessary when the extra furnaces are added on the sixth level. The eighth and last level is 50x70 feet, and here the solution from the tanks above is precipitated and relieved of its golden burden. Here, also, is located the main solution sump. Unless some accident occurs, the plant will be in operation at the time specified in the contract—December 1st.

The Eureka *Democrat* says that camp is without doubt one of the most prosperous in Utah. "As an evidence of this fact it may be cited that during the past week an agent has been in town offering to give employment to 100 miners at Castle Gate and Scofield, but after considerable hard rustling succeeded in securing only six men."

Tribune, 12th: Negotiations that have for some time been in progress between officers of the Highland Boy Mining company and the owners of the Stewart No. 2 mine at Bingham were yesterday brought to a close and on the payment of $50,000 title to the latter property will pass into the hands of parties represented by Messrs. Thomas Weir and Fred Bettles. The former is general manager for the Highland Boy, the latter superintendent of its big mill, through which the extraction of gold has just commenced. The owners of the Stewart No. 2 were represented in the transaction by Mr. George D. Haven, owner of the controlling interest and well-nigh the entire property.

The final payment on a transaction in which the ownership of the Vulcan mine at Fish Springs, in the Deep Creek, is acquired by George H. Whitmore, Alonzo Hyde and Andreas Jensen, all of Nephi, has just been made in this city, and in a few days work on the property will have been resumed with a full force of men. The final payment in the deal, according to Mr. Whitmore, was $15,000. What the total amount was he would not divulge, although it is said that it was no less than $35,000.

IDAHO.

The New York & Idaho Mining Co. will put in a 70-ton smelter nine miles below the town of Seven Devils, on the Indian creek claim. This company is the owner of the Peacock mine. Manager Andrews of the Peacock mine says he will buy two hoisting plants and his company will spend $100,000 in development.

A Wallace report says the Standard mine commenced caving Saturday night with other caves reported since. The tunnel is now said to be full for a distance between five ore chutes to an unknown depth. Only three cars of ore were brought to the dump to-day and the mill closed to-night. The extent of the injury cannot be determined, but it is certainly the worst cave ever known in the Cœur d'Alenes. The company hopes to be working again soon.

At Burke the Tiger has commenced sinking again. The shaft is now 1325 feet deep, and will continue to 1400 feet.

At Kellogg the sheriff will sell the Stemwinder mine, mill and tramway on the 23rd inst., to satisfy a judgment aggregating $101,338.50, together with costs and interest from March 10th last, the date of the judgment. It is understood to be a sale simply to quiet title, as the Bunker Hill and Sullivan Mining and Concentrating Company now owns the entire possessions of the old Stemwinder Company, has moved the machinery out of the mill and been working the mine for months. The judgment was rendered on a mortgage for $97,338.50, given by the Stemwinder Mining Company, which mortgage, it is alleged, was illegal, having been given after the company was insolvent. The Bunker Hill M. & C. Co. acquired title by purchase from the receiver of the Stemwinder Mining Company.

MONTANA.

At Helena a decree in foreclosure winds up the affairs of the Golden Scepter Mining Company and the reorganization of the Quigley property under the name of the Majestic Mining Company.

F. A. Heinze, general manager Montana Ore Purchasing Company, has sued the Boston & Montana Mining Company for $197,150, alleged damages by reason of defendant taking ore from plaintiff's ground.

Superintendent Evans of the Boston & Montana Mining Company is credited with saying: "At Great Falls the Boston and Montana Company is increasing the capacity of its smelting, refining and concentrating works 33⅓ per cent preparatory to an increased output from that and the Butte and Boston property. The old machinery at the Boston and Montana mine is also being supplanted by the new and more modern appliances. The copper basin of Montana is a mile wide and three miles long and continues to hold good at the greatest depth thus far attained, viz., 200 feet." The Butte & Boston has fourteen claims, of which but two are thoroughly developed. Explorations are being conducted in other parts of its territory, and several of these places are opening up well. This work has been going on since the reorganization, and no attempt will be made at regular production for about a year to come.

The Mayflower mine in Madison county is now the greatest producer of the State. Last year it produced about $350,000, but this year even if the present rich ore body holds out it will not yield more than $200,000. The introduction of the cyanide process in many old districts in Montana this season will have an important bearing on the output of next year. In many portions of the State there are bodies of low-grade ore which, it is thought, can be profitably worked by this process.

COLORADO.

With lead at $4 per 100 pounds, or $80 per ton, and the apparent rise in the price of silver it has created a stimulus in upper Clear Creek for mines that carry a good per cent in lead, of which there are quite a number in and around Georgetown and Silver Plume, several of which are now being developed and producing largely, and many that are only partially developed. The manager of a property at Silver Plume makes the statement that with the recent advance in the price of lead and silver it makes a difference in his receipts of about $600 per month.

For the month ending Sept. 30 there were shipped from the Black Hawk depot of the U. P. D. & Gulf railroad 326 cars of ore, aggregating 5216 tons, to the Denver and Pueblo smelters, being the smelting product and tailings for that month. For the corresponding month of 1896 the ore shipments were 302 cars, or 4832 tons. Last month's shipments show an increase of 24 cars, or 384 tons of ore. Owing to the delayed shipments during the repairing of the Gulf road in August, 1896, the following month's shipments were unusually large, so that it can readily be seen that the past month's shipments have a correspondingly substantial increase, as in fact the ore shipments of each month of this present year will show a total increased tonnage of about 40 per cent, when figured up at the end of this year.

The Rio Grande last week announced that ore rates had been lowered as follows between Leadville and Pueblo to Denver: On $100 ore, $3 per ton, instead of $4.45 per ton as formerly; on iron ore, $2 per ton, instead of $3. The three roads interested in carrying ore from Leadville are the Denver & Rio Grande, the Denver, Leadville & Gunnison, the South Park branch of the Gulf and the Colorado Midland. Later the latter road announced that the cut had been met.

A rich gold strike is reported near the Revenue tunnel, on Mount Sneffels, in Ouray county; "$1000 has been taken out of two cubic feet of rock."

Near Breckenridge a big placer scheme is under way. T. R. Miller, an old California placer miner, has control of 1460 acres of placer ground along the valley of the Blue, below Dillon, and in the Blue river basin. The average depth of the deposit is reported to be at 45 feet, and the value of the gravel throughout the entire tract is estimated very high. A company has been formed, composed mainly of Kansas City people. The money required for the commencement of operations has been deposited in the bank, and the work started under the superintendence of Mr. Miller. Water will be supplied from a ditch five miles long, having a fall in that distance of 480 feet, giving all the hydraulic pressure for the operation of giants when it is found necessary to use them. The gravel beds are to be worked from both ends of the tract. At the lower end, commencing at a point where the Blue makes a sharp bend, a bedrock flume will be started, and a tunnel run through the bar across the bend. The flume will be in two compartments, each 8 feet wide, and will be operated by the water encountered at bedrock.

When necessary to clean up, the water can be shut off from one flume, insuring continuous work. This flume will be driven eventually through the entire tract and will be used to wash the rich dirt taken from bedrock in driving the tunnel. Besides the tunnel, a pit will be sunk to bedrock at the upper end of the tract, and the gravel lifted from bedrock to a surface flume supplied with water from the ditch, the boulders being placed on ground beside the flume for which the company has no other use.

For lifting the gravel to the surface will be required a hydraulic gravel elevator. The total cost of the enterprise, including the ditch and the necessary flumes, is estimated at $75,000.

Aspen *Tribune*: The number of unemployed miners here is smaller than at any time since the slump in 1893. New men are being put to work by both companies and leasers and the output of the camp is increasing. The Cowenhoven tunnel extension will result in a further increase of the working force of the district by reason of the work of driving the tunnel and the opening up of more territory on Smuggler mountain.

Republican: The Crœsus mine, in Magnolia district, Boulder county, has been sold to a company of English capitalists, who have organized a stock company with a capital of $1,000,000, and will operate the mine on a large scale. About six weeks ago L. J. Marks, a mining engineer of wide experience in the gold fields of South Africa and West Australia, came here from London and made a careful examination of the property, and, returning to England immediately, recommended the purchase of the property. On his report the mine was bought and the money paid to the owner. The price given is not stated. Mr. Marks has been appointed manager of the property and returned from England a few days ago to take possession. Mr. Marks says that when examining the property samples taken from 365 feet of drifts averaged 2¾ ounces of gold to the ton. The first shipment made under the new management of a few tons of ore gave returns of 4⅛ ounces of gold and 6 ounces of silver to the ton. A lot of selected ore ran 169 ounces gold and 328 ounces silver to the ton.

Pueblo *Chieftain*: All the stamp mills and cyanide mills that have been set up in Colorado and New Mexico in the last two years are hardly a "patching," and the many gold camps are calling for more of them, and with increased vigor. Almost as soon as a stamp mill gets into good running order some big producer absorbs it and its work is confined to the ore of a single mine. This has happened twice at Granite, and though two stamp mills have been built there Granite is still howling for a custom mill. Tarryall wants one very much and has at least two mines near Puma either of which could supply a mill. The same may be said of Bare Hills and of Freshwater, Duncan and Crestone, La Belle and Red River and many other places.

KANSAS.

A train load of lead ore, consisting of 600,000 pounds and filling fourteen cars, was sold at Galena, Kan., last week by G. E. Geissinger to the Argentine Smelting Works. This was the output of one shaft in the Frisco mine, one mile southwest of Galena, which has been accumulating in the bin for six months waiting for an increase in price. The ore brought $31 per 1000 pounds—the highest price paid for ore in the district for several years.

NEW MEXICO.

The survey for the branch railroad, three miles in length, from San Jose to Santa Rita, has been completed and the contract for grading will soon be let. Preparations are being made for the filling of the large iron contract, 3000 tons per month, which the Santa Rita Copper and Iron Company has made with the Pueblo Smelting Company. The Gilchrist leases on the Guadalupe, Chino and Oxide mines are doing well. The Driscoll Company continues to take out its usual quota of ore from the old dumps.

ARIZONA.

Our Mineral Wealth: The rich strike made last week at a depth of 150 feet on the Schuylkill mine at Chloride still continues. The ore is worth $25 in gold and 1000 ounces in silver per ton, and the ore body is about 5 feet thick. Besides the precious metals in the Schuylkill ore, it carries a high per cent in lead.

The Gold Cliff Gold and Silver Mining Company, Wm. Johnson, superintendent, operates a mile east of the Commonwealth. The company have put down a shaft of 175 feet and some stoping has been done, which shows ore 10 feet wide, similar in character to that of the Commonwealth. A hoist is being operated and a cyanide plant is to be constructed.

Supt. Thompson at Rosemont, on the Chicago mine, at a depth of 250 feet has a 20-foot body of sulphide ore.

In Aravaipa canyon, Graham county, the Grand Reef Mining Co., J. W. Paine superintendent, is working thirty men, preparing for the erection of a large amount of new machinery. About 150 men are now at work building a road from the main road in Aravaipa canyon to the Burgess mine, eight miles. When the road is completed active work will commence on the mine.

MEXICO.

O. P. Poole is enthusiastic over the mining outlook in Mexico. He says Mexico is no place for a poor man, or anyone without capital, but one with means will find good chances. "A man with $10,000 can go there and his money will amount to $24,000 in Mexican currency. Gold can be mined on a silver basis, by which I mean the labor can be had at 60 to 75 cents a day in Mexican silver. An ounce of the retort gold, bringing $16 to $18 here, brings $30 there. The Mexicans cannot handle machinery to any extent, and are poor hands at gold mining. Americans have a good field." He adds that on the train he came on there was $800,000 in silver, which had been bought by Chinese and was being shipped to San Francisco.

The Mulatos mine, twenty miles from Hermosillo, State of Sonora, is again reported sold, this time to "an English syndicate for $1,000,000."

LOWER CALIFORNIA.

Lower Californian: Douglass and Burr, from Cedros island, say the mines are on the north end of the island, which has an area of some eighty square miles, and lies about fifty miles off the coast and is about 230 nautical miles from Ensenada. The island lies north and south and the mineral belt cuts it diagonally across northwest and southeast. In some places it is half a mile in width. There are two principal outcrops, five miles apart. At the northern outcrop is the old camp, where there are three properties lying parallel—the Esperanza, Guadalupe and Chicago—and the mineral has a continuous expanse across these properties for a width of 600 meters, having an area of 290,000 square meters. This ore is quartz, bearing copper, iron and gold. As is natural, the ore is oxidized near the surface, and it is estimated that this character of ore continues to an average depth of 15 meters, thus giving 435,000 cubic meters, and as this is very light material, an allowance of one meter being made per ton gives 4,350,000 tons of this class of ore. At the other outcrop, five miles to the south, though smaller, the area of quartz exposed is still of gigantic proportions, being 100 by 500 meters, or 60,000 square meters, and evidently of a depth corresponding to the first camp, thus giving 750,000 tons of ore in sight. Below the depth of fifteen meters average depth the ore is in its original base condition, with practically the same proportions of the metals as at the surface. The bright colors of the quartz are blood red, yellow, blue, white and black various combinations, and form a striking picture which may be seen for miles. Various estimates as to the value of this vast body of ore place it between $5 and $12 per ton. Located as it is on an island, where machinery, lumber and supplies can be delivered by shipload, this ore should be mined and reduced at a minimum cost; and even figuring at $1 profit per ton, it will be seen at a glance that it is one of the greatest of mining propositions.

Yuma *Sun:* The Steamer Mohave returned the first of the week from the mines of the Mexican Mining Company in Lower California, with a large consignment of sulphur, which Graham Caldicott, the assistant treasurer and representative of the company at this point, is shipping to consumers and refiners all over the United States, in sack lots. These shipments are simply intended as samples, to introduce the product of the mines, which will doubtless in the future supply a large percentage of the sulphur consumed in this country and Mexico. There is perhaps no other place in North America where so enormous a deposit of almost pure sulphur exists as at this one. The supply is apparently unlimited, and the ore almost pure sulphur. In places, however, it is accompanied with alum in quantities which it will pay to save. Alum brings $15 per ton, and as it runs in veins a foot or more in width in these mines, and must be mined in mining the sulphur, it will certainly prove profitable to handle. Gold has also been found associated with the sulphur ore, Mr. J. A. Dubbs, president of the company, during a recent visit to the mines, discovering a considerable nugget of pure gold in a piece of sulphur he picked off the dump. The Mexican Sulphur Company is pushing the development of this great property, and as the gentlemen managing it are experienced, the result can but be satisfactory.

BRITISH GUIANA.

The Barima Gold Mining Company held a meeting September 2nd, in Georgetown, British Guiana. The report showed that for the half-year ending June 30th, 2511 ounces 17 dwts. 6 grains of gold were received, the result of 2636 tons of ore crushed and 75 days work, and remaining on the mine at that date were 332 ounces 18 dwts. 13 grains of gold, the result of 644 tons crushed and 13 days work. The return per ton of ore crushed averaged .867 ounces of gold. The expenditure for the half-year ending June 30th was $68,003.49, and the net value of gold received, and estimated value of what was on hand at date, amounted to $46,016 63, showing a loss of $21,986.86.

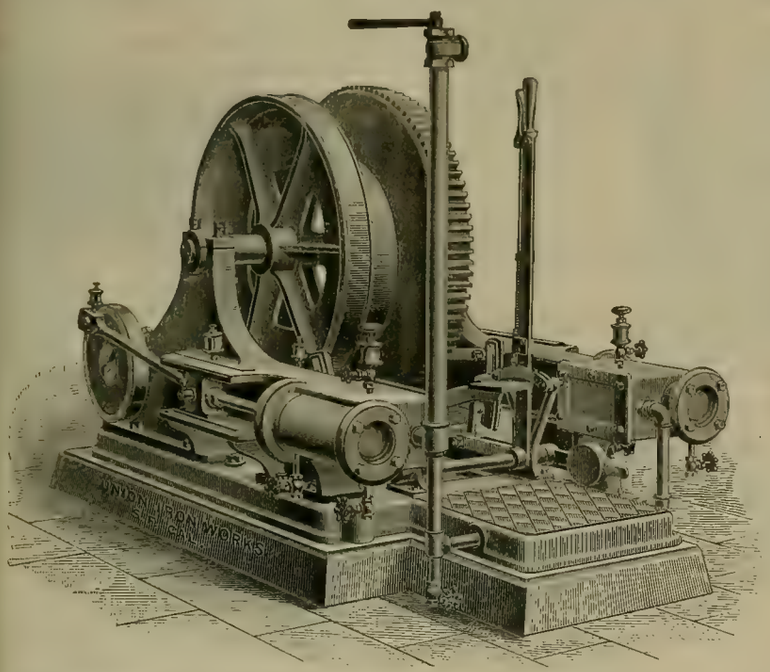
The leader of a recent expedition to that country says: "Alluvial mining will never make New Guinea. I never saw a reef all the time I was there, from the mouth of the Vanapa to the foot of Mount Knutsford, but only a few bits of stringers in basalt and slate in the creeks. Ninety per cent of the men who went up with me got the fever and a large percentage died. It was pitiful to see the poor wretches, stricken with this terrible scourge, trying to crawl back to the coast. I wish I may never see such a sight again. The strongest men, too, are the ones who suffer most. The climate—it is impossible to describe it. Then there are thorny creepers which tear your clothes and skin, and drag you back—long, trailing 'lawyer' vines, with hundreds of strong spikes on their creeping branches, strong enough to pull a man back if they once catch him. The natives, too, are thievish and treacherous and cannibalism is rife. The fever is a horrible scourge, and there is another loathsome disease—the scrub itch where masses of little red parasites fasten on the body, and eat through the flesh right to the bone. Numbers of men have been killed by them. The expenses of prospecting in such a land are exceedingly high—£40 or £50 is no use at all; the natives refuse to act as carriers unless paid in money, and many won't do the work for any consideration; and, as added to this, there is practically no gold to go for. I want to strongly warn miners against attempting the journey."

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

CASTINGS AND FORGINGS

OF EVERY DESCRIPTION.

All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

Send for Circulars and Price List.

DOUBLE CYLINDER SINGLE DRUM HOIST.

MINING AND MILLING MACHINERY.

THE above form of Hoist has certain features of construction which make it superior to all others It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

Coast Industrial Notes.

—The Sierra, Cal., Railway from Oakdale to Jamestown will soon be completed. The track is now laid to Montezuma, five miles from Jamestown.

—One cause of the rapid appreciation of lead is because of the high price of wheat and corn and the abundance of the crops, for every farmer can now paint his house and barn, which means many million pounds of white lead.

—The Tuscarora, Nevada, *Times-Review* says men have begun placing the electric power plant in position. A dam will be built at the head of the canyon and the water conveyed through wood pipe. It is estimated that about 200 H. P. will be developed.

—The Fullerton Walnut Growers' Association has received estimates from all the associations in southern California, the total number of carloads of the present crop being 220. The association estimates that the entire crop of southern California will sell for at least $325,000.

—The Santa Fe Pacific Co. has awarded a contract for furnishing hewn ties to be preserved in the pickling plant lately established at Bellemont, twelve miles east of Flagstaff, Arizona. From 300 to 500 men will be kept at work in the pine forests of Coconino furnishing the ties.

—The Pittsburg company that has a fifty years' lease of the Sulphur Mountain, in Lower California, forty miles from the Colorado river, will build a railroad to Yuma. The sulphur is being quarried. American Vice Consul Godbe, Ensenada, has a concession for the mountain and will receive a royalty.

—The war department has directed advertisements for a proposal for building a large stone pier at Gray's harbor, Washington. The original advertisement, although within the appropriation of $520,000 to $900,000, failed to produce suitable stone. Since that time the department has been informed that good stone has been found near at hand.

—The California vintage of 1897 promises to reach 20,000,000 gallons, or 25 per cent more than last season. About one-half of the grape crop has been converted into wine. The growers are receiving an advance of from $5 to $10 a ton for their grapes, the understanding being that they are to receive one dollar for every cent per gallon the wine brings when sold.

—C. J. Smith, receiver of the Oregon Improvement Company, has filed his report for August, 1897. It shows gross earnings of $491,183, expenses of $327,472, and net earnings of $163,710—a large increase over the net earnings of August, 1896, which were $60,757. The report also shows that the net earnings for the fiscal year ending August 31, 1897, were $538,476, an increase of $345,000 over the preceding year.

—As evidence that people must have Pacific coast lumber, the shipment of a cargo of red cedar lumber by Lewis & Crane, of Seattle, to Buenos Ayres, Argentina, South America, is significant. The order was for tank stock, and was shipped by rail to New York, thence to London by steamer, and again by steamer to destination, a journey of over 14,000 miles, —a roundabout way and an illustration of the need of the Nicaragua canal.

—Attorney-General McKenna has issued an official statement announcing that the Government had decided not to appeal the Union Pacific foreclosure suit, but would allow the road to be sold on November 1, in consideration of the Union Pacific reorganization committee raising its guarantee bid from $47,745,059 to $50,000,000. "The road," he added, "is to be sold to the highest bidder, but with a minimum bid guaranteed as stated."

—With a larger wheat crop selling at good prices, hundreds of farmers in Oregon and Washington will this year have a surplus after paying their debts, and others will largely reduce their indebtedness. Many of these people two years ago were in danger of losing their farms from foreclosure. At that time wheat sold in eastern Washington as low as 16c per bushel, transportation to the seaboard costing 14c, whereas this fall the crop has been selling at from 60c to 80c. California also makes an admirable exhibit along these lines.

—At Sacramento on the 13th Engineer Nurse filed his report with the auditing board to the Commissioner of Public Works upon the investigations and surveys made on the San Joaquin and Sacramento rivers. The report makes an estimate of improving the channel of the San Joaquin at Stockton, recommends and estimates the cost of removing the new town shoals and the closing of the Hershey and other breaks above the city of Sacramento. The auditing board will probably meet next week and order the publication of the estimates and advertise for bids for completing the work as recommended in the report. The total amount of the expenditure which is recommended will be in the neighborhood of $50,000.

—*Locomotive Engineering* is surprised "to find that coal can be mined in China and sold in California at a profit. Several cargoes of coal have been imported into California, and those who are familiar with it report it to be of very good quality. It is expected that within a very few years the Chinese coal mines will supply the whole market of the Pacific coast, except those portions where coal is found. The extremely cheap labor of China enables the coal to be brought to the surface at a very low price. The only obstacle to very active competition in this industry at present is the want of good transportation facilities in China. The extension of Chinese railways, which has begun very actively, is going to exert a very prejudicial effect on the coal mining interests of the United States and Great Britain."

—The Canadian Pacific Railway has placed two corps of surveyors in the field, with a view to opening up the Stikeen River route to the Yukon mines. From the mouth of the river to the point at which the road down the Yukon will begin there are said to be no engineering difficulties, and it is believed the line can be kept open seven months in the year. It is proposed to run a line of fast steamers from Victoria to Fort Wrangel. Steam vessels can run up the Stikeen river for 149 miles, from this point a railroad will be built to Teslin lake, 125 miles further. Light draught steamers will be placed on the Yukon, and it is believed that Dawson City may be reached in thirteen days from San Francisco.

Recent California Mining Incorporations.

Alta California G. M. Co., San Francisco; T. J. Parsons, G. W. Baker, F. W. Vaughan, W. A. Jacobs, S. K. Thornton; capital stock, $100,000; subscribed, $60,000.

Personal.

F. A. R. PENROSE is reporting on the Hailey, Idaho, Gold Belt. The local paper says that his interest in the Pearce mine, Arizona, nets him $1,000 per day.

R. L. DUNN, of San Francisco, sailed last Thursday for Siberia to examine and report upon some quartz properties at the instance of a French syndicate.

PHILLIP DEIDESHEIMER, the first superintendent of the Hale & Norcross mine, Virginia City, Nevada, is examining property at Lundy, Mono Co., Cal.

Commercial Paragraphs.

THE contract for the cast iron work for Wells, Fargo's new San Francisco building, to cost $16,000, has been awarded the Joshua Hendy Machine Works.

THE Fulton Engineering & Shipbuilding Works are building four schooners—three of them for the lumbering trade and one for fishing purposes. The latter will be equipped with compound condensing engines. They are also building a new steamer for the California Navigation Co. to ply between San Francisco and Stockton. The contract requires a speed of 20 knots per hour.

THE James Leffel Water Wheel Company has closed a contract with St. Paul capitalists for six turbine water wheels of 1000 H. P., each for a $2,000,000 power plant to be established near Butte, Mont., on the Big Horn river. While the plant will furnish electricity to Butte and power for general purposes, the plant is being built chiefly to supply power to the copper mines near Butte. The wheels are intended to be the largest ever built.

THE Union Gas Engine Co. of San Francisco has furnished eleven engines to the Tokio Navigation Co. for use in their vessels in Japanese waters, and this week received an order for six more with very complimentary reference to the efficiency of these machines. The Union Gas Engine Co. is now building a 50 H. P. engine for a launch for G. W. McNear of the Port Costa Flour Co. and another similar engine for the San Francisco Launch Co. at North Beach, and a 60 H. P. engine for W. A. Ryan & Co.

IN a distant city, says *American Investments*, there has recently been organized a little company which has for its object the looking after of freight contracts and overcharges for shippers generally. Railroad freighting has become so complicated these days that, unless one devotes his whole attention to it, the subject cannot be grasped to much advantage and profit. The various classifications, rulings and decisions of the powers that be are quite beyond the average shipper's comprehension, so he will welcome with open arms any plan or system that will bring him an immunity from the perplexities and cares of attending it himself. The company proposes to do all that is desired by the shipper in the direction of securing rates, advantageous packing, collection of overcharges and everything that will enable the shipper to put his goods into the hands of his customer at the lowest possible cost. It will be a great saving of worry and time. Similar companies have been formed to look after taxes and assessments for firms and individuals, which so far as we know are working admirably, resulting in the saving of many dollars. We have car-tracing bureaus, concerns that tell merchants how buyers of goods at retail pay their bills, clean towel companies and what not. Everything comes to him who patiently waits for it long enough.

Recently Declared Mining Dividends.

Mercur, Utah, $25,000, Oct. 20—a total of $800,000.

E. H. SCHAEFFLE, of Murphys, Cal., is now traveling through Amador, Calaveras, Tuolumne and Mariposa counties as agent and correspondent for the MINING AND SCIENTIFIC PRESS.

New Publications.

Catalogue No. 15 of the Risdon Iron Works, Howard and Beale Sts., San Francisco, is devoted to "Gold Dredging Machinery." They have the Postlethwaite patent and the right of building those dredges; also, the new form of gold tables and riffles. The catalogue contains in its entirety a recent article on "River Dredging for Gold," written by Mr. Postlethwaite for this paper, which gives the result of his New Zealand experience in that line, and a technical description of the new $25,000 dredger he has just finished on the Yuba river, handsomely illustrated. This method of mining is financially successful in New Zealand, and experiments in the same direction in California rivers have proved fairly successful. Those desirous of learning more about this system of securing gold would do well to send to the Risdon Iron Works for the pamphlet, as, next to seeing the dredge itself, its pages furnish the best exposition of its construction.

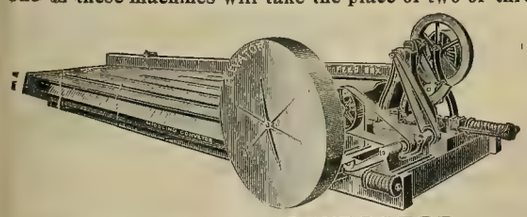
SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LATHING AND FINISHING FOR BUILDINGS.—Martin Carrick, San Francisco, Cal. No. 591,207. Dated Oct. 5, 1897. This invention relates to improvements in lathing and finishing buildings. The object is to provide for the construction of complete walls, ceilings and partitions in which a space is provided for deadening, means for protecting the plaster from water and making the construction vermin-proof. The lathing is made in sections or sheets preferably of sheet steel, or other suitable metal stamped by dies with slots or channels and intermediate parallel bars so as to form a key or lock to hold the plaster in place. The sheets are so arranged as to overlap and break joints and also be supported out of contact with the surface upon which they are nailed and the construction is such that they may be bent to fit the angles or curves of cornices and to fit about posts or pillars where the plaster is to be applied, and in any position where it is desirable to use them.

ADJUSTABLE SCAFFOLD.—Martin Carrick, San Francisco, Cal. No. 591,208. Dated Oct. 5, 1897. This invention relates to a scaffolding which is especially designed for the use of plasterers, wall artists and decorators where it is necessary to have the scaffolding in rooms, halls or other structures. The scaffolding consists of vertical hollow posts with other posts telescoping therein, holes made in each of them to coincide and bolts by which they are united together, transverse bridge bars extensible horizontally and united to the vertical posts by brace rods and in conjunction with these are other brace rods which rest upon the floor and serve to retain the posts in an upright position. This apparatus can be fitted to any height or width of room, moved from point to point without being taken down while within the room and finally reduced to a very small compass for the purpose of transferring from one room to another, or one floor to another.

SLIDING-HINGED WINDOW SASH.—Wm. McCall, San Francisco, Cal. No. 591,356. Dated Oct. 5, 1897. This invention relates to an improvement in windows and their sashes. It consists essentially in the combination with the sashes of independent vertical slides movable in guides in the casing having window weights connected with them, a novel means for locking the sashes to the sliding portions or to disengage them from the sashes and simultaneously lock the slides to the casing, and hinges upon the opposite edges by which the sashes may be opened inwardly for the purpose. When thus opened the sliding portions are locked by suitable mechanism so as to prevent their being thrown up by the action of the weight which is attached to them.

POISON DISTRIBUTER FOR FIELD USE.—M. L. Griffin, Priest Valley, Cal. No. 591,216. Dated Oct. 5, 1897. This invention relates to a device which is especially useful for distributing and placing poison for the extermination of gophers, moles, ground squirrels and other vermin which burrow in the ground. It consists essentially of a containing case having a contracted roller end, a discharge spout connecting with and extending downwardly from one side, an intermediate channel having openings out of line with each other communicating respectively with the discharge spout and with the containing case, a slide movable in the intermediate channel having an independent slidible block forming a chamber between itself and the lower end of the main slide, a screw-threaded rod extending through the top of the main slide having a swiveled head in the lower end turning loosely in the sliding block so that the latter may be moved to increase or diminish the size of the chamber by means of a spring-pressed foot-piece, the slide would be moved upwardly when pressure is brought upon the foot-piece by resting it upon the ground, and this brings the movable slide into line to admit the poisoned grain from the containing receptacle, and when the pressure is relieved the slide is returned by the spring and the grain which was delivered into the chamber is transferred to the discharge passage. The device is adapted to be carried about by means of a handle so that a person riding on horseback can travel over the ground and introduce the poisoned grain into the holes of the vermin without dismounting.

KITE.—Max A. Daberer, West Berkeley, Cal. No. 591,211. Dated Oct. 5, 1897. This invention relates to improvements in the construction of hollow or box kites. It consists in the novel arrangement of triangularly disposed rods or frames having a covering material, these coverings extending in sections at the top and bottom, and in conjunction with this device may be used propellers. Wings are fixed upon the sides of the kite which may be turned so as to steady the kite in its flight

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 14, 1897.

Business has been quieter, yet the volume of goods going out is in excess of the corresponding time last year. Then the feeling was largely pessimistic but now it is optimistic with croakers few and far between. The steadiness of wheat at the higher prices and better average prices obtained for all kinds of farm, dairy and orchard products and also for live stock are calculated to promote a feeling that 1898 will be the most prosperous year seen for over a half decade. To this must be added also the almost certainty that gold mining will forge ahead and work into a good-sized boom. The Klondike craze this fall with confirmed reports of the richness of many mining streams have had their effect in centering investors at home and abroad on the vast mineral wealth of this coast. They are keenly alive to investments calculated to pay a good percentage on the money invested and for such mines they stand ready to pay well for. It is stated that several experts are looking up such properties in California and neighboring States.

The money market continues to rule in favor of borrowers. Deposits are quite heavy, which, in the absence of speculation outside of wheat, goes far to show that business is based on a legitimate basis and has good substantial foundation. The banks have large accumulated funds, which is witnessed in the reports made at the annual meetings of the Nevada Bank and Bank of California, each of which had over $3,000,000 in cash on hand. It is stated that considerable sums have been sent to the East where good employment was offered, but the shipments of over six million dollars in gold to this country has caused an easier tone there. If these shipments should be followed by others, then the ease would be more pronounced. What effect the higher charges for gold by the Bank of England and higher rates of discount on the continent will have is as yet uncertain, but it is reasonable to affirm that it will check, temporarily at least, large gold shipments to this country, for it may be instrumental in causing European holders of American securities to sell a large proportion, which would for a time equalize trade balance.

New York Silver Prices.

NEW YORK, Oct. 14.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26⅛	56⅛
Saturday	26⅜	57
Monday	26⅜	56⅞
Tuesday	26⅜	57
Wednesday	26⅜	57
Thursday	26¾	57¾

	Copper.	Lead.	Iron.	Tin.
Fri.	11 10 @11 30	4 17½	10 00@12 25	13 65
Sat.	11 10 @11 25	4 20	10 00@12 25	13 65
Mon.	11 15 @11 25	4 17½	10 00@12 25	13 70
Tue.	11 10 @11 25	4 12½	10 00@12 25	13 70
Wed.	11 10 @11 25	4 10	10 00@12 25	13 75
Thur.	11 10 @11 25	4 10	10 00@12 25	13 75

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.83
London Merchants	$4.81
London Sight Bankers	$4.85
Refined Silver, per oz. 1000 fine	57¾
Mexican Dollars nominal	46

The British steamer Doric, hence October 12th, took out the following: For China, Mexican dollars, $216,593; silver bullion, $158,500; for Penang, Mexican dollars, $50,000.

SILVER.—The market strengthened the past week, making a sharp jump to-day. Bankers here say that it is unnatural, and therefore it is without stability. While this may be the case, yet it goes far to prove that the market is very sensitive, and an increase in the demand is responded to by higher prices. This ought to suggest the possibility that the world's available spot supply is largely reduced. There can be no question that within the past two years larger quantities have gone into arts and for general purposes than ever before within the like period of time. Aside from that, many countries have been purchasing quietly so as to replace worn coin with new and also increase the circulation, which was too small under increased business.

MEXICAN DOLLARS.—The market is stronger to-day with 46 cents obtainable for round lots, but there is no telling what the price will be to-morrow, it being governed entirely by that of silver and exchange.

COPPER.—The market has held fairly steady with us, but it is slightly easier at the East. The weaker tone there is due to a falling off in the European demand and no increase in the demand in this country, with the output from the mines showing no falling off in production.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—The market is steady. Shipments by water the past week were 100 flasks to Mexico and 4 flasks to Victoria, B. C.

Our market is quoted at $38 for domestic consumption.

LEAD.—The market is weak and while quotations remain unchanged lower prices can be had. The market at the East has eased off some.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00	@	5 25
Sheet	6 25	@	6 50
Pipe	5 50	@	6 00

TIN.—Our market is unchanged. We are informed that there are inquiries from canners on the market for next season's supplies of plate. The East reports pig stronger in sympathy with improved prices abroad.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is easy.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—For mining the demand is very large. Quotations are unchanged.

COAL.—The market is lightly supplied with Seattle. The exodus of miners to Alaska has lessened the output on this coast owing to mines running light-handed.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@— —
Gilman	5 50@— —
Seattle	5 50@— —
Coos Bay	—@ 4 75
Cannel	9 50@— —
Egg, hard	12 00@— —
Wallsend	6 75@— —

TO ARRIVE—CARGO LOTS.

Australian	5 75
Liverpool Steam	6 75
Scotch Splint	7 50
Cardiff	7 50
Lehigh Lump	12 00
Cumberland, bulk	10 50
Egg, hard	9 50
West Hartley	6 75

COKE.—The market is quoted as follows:

Gas Companies'	— — — —
English, to load	— — @ — —
" spot, in bulk	10 00 @ — —
" in sacks	11 00 @ 12 00
Cumberland	— — @ — —

IRON.—The market is firm for both foreign and American.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

NAILS.—The market is strong with a good demand ruling.

upwards.

Wire, carloads, basis per keg	—
" jobbing, " "	$2 45
Cut, carloads, " "	—
" jobbing, " "	2 35

ANTIMONY.—The market is firm.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

The demand is almost entirely of jobbing, there being a light movement from first hands. A thorough canvass of the market does not show any change in quotations. We are informed that there does not seem to be any disposition to advance prices.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported easy from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is good for export.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Oct. 14, 1897.

The market has been spasmodically active, with the center of attraction for traders still in Crown Point and Belcher, with Yellow Jacket a fair second. The moves in Belcher are rather mysterious, and to an outsider are an unsolved riddle. After selling up to $2.15 it sold down to as low a figure as 58 cents. The advance was not warranted by any showing in the mine and can only be accounted for on the supposition that those shorts who frightened on street points when the shares were $1.50 that the Jones crowd were buying after the largest shorts filled. The Jones crowd neglected to sustain the prices, but let them off with a rush, which prevented a line of shorts being put out and the street bulls from getting out. The Belcher shares have for several days been fluctuating between 60 and 75 cents, Crown Point between 70 and 85 cents, and Yellow Jacket between 70 and 80 cents. These moves make them attractive to boardroom traders, who put them out on the small ups and fill on the small downs. The rest of the market is not affected much by the erratic moves of the above three. Chollar, Potosi and Sierra Nevada show an undertone of considerable strength. It looks as if the shares are being absorbed, but whether they will go off after the present buyers get enough remains to be seen. As a rule lower prices generally follow a steady absorption before an upmove is made. In Crown Point they ought to be ready to run for the ore, while in Belcher they will be ready to start work for it some time next week. This, no doubt, causes the shares of these two mines to be quite sensitive. The belief prevails with well informed miners that they will not report finding enough ore to warrant any advance in the shares on a legitimate business showing, but what will be done on a gamble they are not expressing an opinion. Reports are current about work in Yellow Jacket, but we fail to have them verified, as yet. In about every mine on the Comstock lode and also on the Brunswick lode active and important work is being done, which is calculated to make the shares a gamble so long as it continues.

The news from the Comstock mines continues to report active work, but with no increase in the force of men at work. At several points work is nearing completion which will admit of active exploiting and to a much better advantage. This work is causing the older and more experienced miners to watch the progress with greater interest than usual, but, so far as we are able to learn, there is not one that expects anything big to be developed this year; but there may be enough to cause outsiders to hold shares, by which mine managers can collect assessments, so as to lay the foundation for more active work after the winter months. In Utah they are still running in a northwesterly direction. The formation is favorable. They have started a tunnel in Sierra Nevada to tap the ore on the Layton tunnel at a lower depth. This work will be watched with interest. No change is reported in the work on the 900-foot level. From Union nothing new comes to hand. They are still running an east crossdrift on the 1000-foot level in Mexican. West crossdrift No. 3 in Ophir on the 1000-foot level was at last advices in better formation. It is in over 500 feet. No change is reported in the work on the Central tunnel level. They have shipped to the Mexican mill for crushing 252 tons of ore, assaying over $22 to the ton. They are still drifting north in Andes on the 175-foot level. In Con. Virginia work is confined to the 1550-foot, 1650-foot and 1750-foot levels. Nothing new from Best & Belcher. They will commence extracting 1000 tons low grade ore in Gould & Curry next Wednesday. This ore is for testing to see if it will justify extracting. The work in Savage is practically the same as has been reported for several weeks past. No work in Hale & Norcross. They will soon be through with the repairs in Chollar. In Potosi they are in position for the better extraction of ore on the upper levels. Last week forty tons were extracted, giving nearly $14 in gold and over 13 ounces in silver. In Alpha they have started a northeast drift from the top of an upraise from the 500 foot level. No change is reported in the work in Con. Imperial, Confidence, Overman, Seg. Belcher, Kentuck, Alta or Justice. The work in Crown Point and Belcher is noted in the introductory above.

From the Brunswick lode our advices state they have commenced on the 300-foot level of Gould & Curry an east crossdrift on the Best & Belcher boundary line. They are working on the 600-foot level. They are extracting less ore from Chollar. Active work is being done on the 500-foot and 600-foot levels. On the former they are running south, while on the 600-foot level several crossdrifts are being run. In Occidental they are running two new crossdrifts on the 650-foot level. The work in this mine seems to be prosecuted with energy on the 550-foot, 650-foot and 750-foot levels.

The market opened barely steady this morning with the north end and middle shares under support. After call a raid was made on Crown Point, Belcher and Yellow Jacket so as to drive holders to sell shares mostly, desired owing to an improvement in the 600-foot level in the joint Con. Virginia, Best & Belcher and Gould & Curry workings on the Brunswick. This is considered quite important for experienced miners have always claimed good results at that end. The formation is improving in the Confidence, Challenge and Con. Imperial west crossdrift. It looks as if they are near ore. Advices from reliable sources are very encouraging to-day from several mines. The market was steadier this afternoon. Strong parties have been buying several days.

The following illustrates the changes of the week:

Mines.	Oct. 7.	Oct. 14.
Alpha	$ 21	
Alta Consolidated	23	$ 17
Andes	30	33

NOTICE OF SPECIAL MEETING
OF THE
STOCKHOLDERS OF THE SUNOL LAND AND IMPROVEMENT COMPANY.

Notice is Hereby Given that a Special Meeting of the Stockholders of the Sunol Land and Improvement Company, a Corporation, is hereby called and will be held at the office of the Company, at 240 Second St., in the City and County of San Francisco, California, at the hour of 4 o'clock P. M. of the 26th day of October, 1897. The object of such meeting is the election of a Board of Directors of said Corporation, to serve and act as such until the next annual meeting of the Stockholders of said Company, or until their successors are duly elected and qualified. The said meeting has been called by the order of Stockholders holding more than one-half of the votes of the Corporation, to-wit: W. J. Wiley, Thos. Alton, C. B. Stone.

Dated San Francisco, California, October 8th, A. D. 1897. C. B. STONE, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from San Altyre, in the Emerton mine, near Gibsonville, Sierra Co., to deposit tailings in Slate creek; and in the Doherty mine, near Table Rock, Sierra Co., to deposit tailings in Slate creek; from Victor Montre, in the Grizzly Canyon mine, near Pike City, Sierra Co., to deposit tailings in Grizzly canyon; from B. F. Atkinson, in the Homestake mine, No. 2, near Sierra City, Sierra Co., to deposit tailings in the impounding basin of the Homestake mine, and from C. R. Scott, et als., in the Gold Nugget mine, near Gibsonville, Sierra Co., to deposit tailings in Canon creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on October 25, 1897, at 1:30 P. M.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

Assaying Gold
AND
Silver Ores.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents.—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ores Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

FOR SALE, AT A BARGAIN.
A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.
First-Class Air Compressor (Steam driven) and Drill, New.
Also, 3-Ton Capacity Pulverizer.
A. L. FISH, 59-61 FIRST ST., San Francisco.

FOR SALE CHEAP.
1 New Giant Drill
Arranged to run by AIR or STEAM.
With Column Clamps and Numerous Extra Parts. Apply to MILLER, SLOSS & SCOTT, 18 Fremont Street, San Francisco, Cal.

FOR SALE CHEAP.
Gold Wet Washing Machine,
MAIT'S MAKE.
Capacity, 8 Tons Per Day.
Good order. Can be carried anywhere by prospector.
Address T. L., this office.

WANTED.
By a graduate mining engineer (age 29) any position in a mine, mill or office that may lead to advancement. Have my own surveying outfit.
Address L.C., office Mining and Scientific Press.

WANTED — GOLD AND COPPER MINES.
We have customers wanting to purchase good developed Mines. Drawings and Report required. Will mail latter to fill out, when requested. Six to nine months' bond necessary, which need not stop work.
Will also put stamp mill on good mines, for half interest. Address RUSSELL & POOLEY, 449 Wilcox Building, Los Angeles, Cal.

WANTED.
Position as Master Mechanic
With Any Reliable Mining Company.
Am familiar with all types of engines, boilers and pumps to date, and competent to build and repair any machinery in the mining business. Have good discipline and good experience. Will go any place. Address "A," care Mining and Scientific Press.

THE South African Mining Journal.
Published Weekly in Johannesburg (Transvaal).
The official organ of the mining industry, the Witwatersrand Chamber of Mines, Johannesburg Chemical and Metallurgical Society, and the Mine Managers' Association.
Contains the latest and most authentic information relating to the gold mines of South Africa.
The Best Advertising Medium for Makers of Machinery.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. AND PACIFIC ELECTRICAL REVIEW.

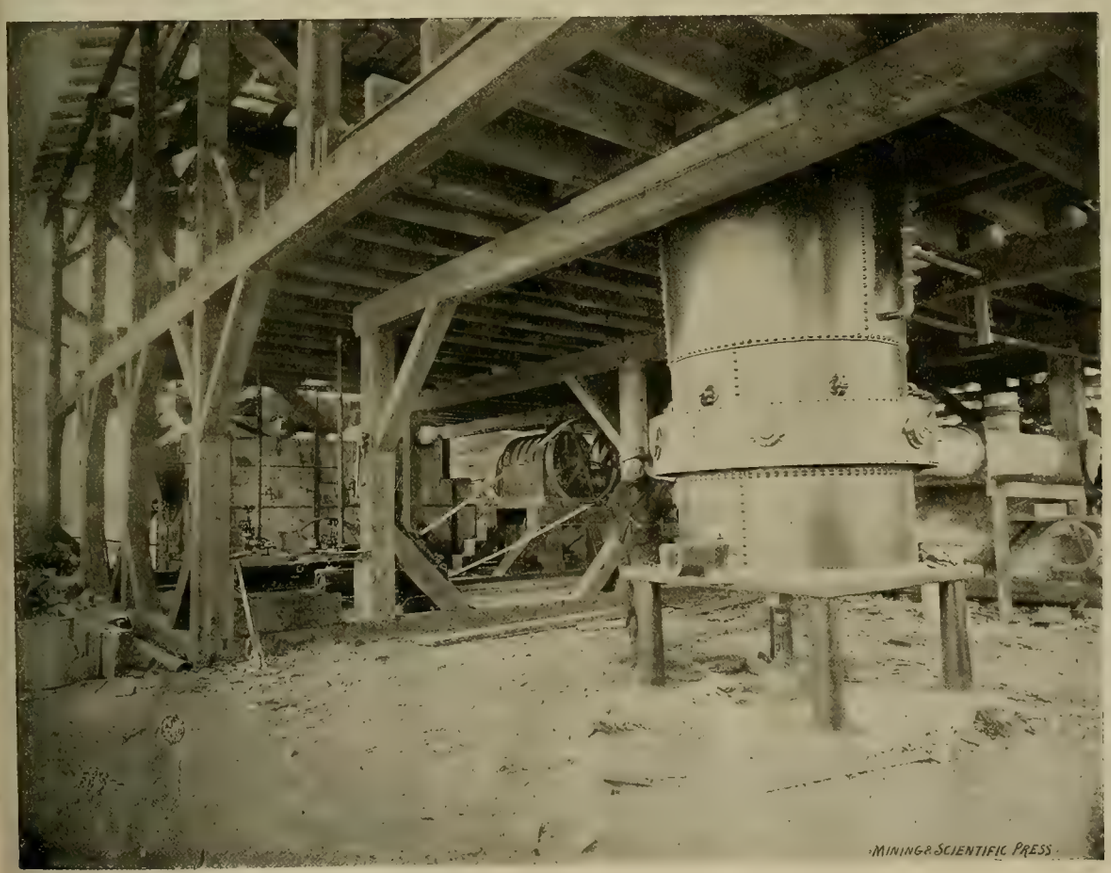
No. 1946.—VOLUME LXXV. Number 17. SAN FRANCISCO, SATURDAY, OCTOBER 23, 1897. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

A Mountain Forest and Sawmill.

The forests of Fresno county, Cal., comprising nearly four thousand square miles, covered with redwood, sugar pine, yellow pine, fir, cedar and oak, are of great commercial value. Two sawmills are in the timber belt of the Sierra Nevada mountains, one on Kings river and the other on Pine Ridge, near the San Joaquin. Flumes sixty miles in length carry the manufactured lumber, posts, wood, etc., from the sawmills in the mountains out upon the plains. One of these flumes ends at Sanger and the other at Clovis. At both of these points doors, sash, blinds, boxes and finished mill work of every description are turned out. One of the sawmills on Kings river daily cuts a quarter million feet of lumber per day; the combined output of the two companies is over forty million feet of lumber annually, besides sash, doors, shingles, lath, posts, etc. The lumber companies at these two places employ nearly one thousand persons. There are also several small mills where from five million to ten million feet of lumber are manufactured annually. The owners of the mills now in operation say they have timber enough to run from twenty to forty years, and they own but a very small part of the milling timber of Fresno county, which illustrates the great lumber supply of this one California county. The engraving on this page is furnished through the courtesy of the *Interior*, Fresno, Cal.

SUGAR PINE FOREST AND SAWMILL IN THE SIERRA NEVADA, FRESNO COUNTY.



BOSTON-NEVADA COPPER M. CO.'S SMELTER, YERINGTON, NEV.

A Smelter at Yerington, Nev.

The accompanying engraving from special photograph for this paper depicts a little smelter just completed at Yerington, Nevada, for the Boston-Nevada Copper M. Co. to treat the copper ore of Mason Valley. The furnace is a 42-inch water jacket, built by the Union Iron Works of San Francisco. Supt. O. B. Hardy writes: "The cost of construction, including cost of all machinery, boarding house, bunk house, assay office and blacksmith house, is about $20,000. I am turning out per twenty-four hours about six tons of black copper, containing 70% copper and $30 gold. I have blocked out in mine, ready to run through smelter, about 30,000 tons of ore."

At the University of California, Berkeley, Cal., last week, Prof. O'Neil of the Department of Chemistry, in the course of a lecture on "The Transmutation of Metals," declared that the idea of making gold from silver and other metals is not an unreasonable one. The professor believes that the old alchemists who searched for a means of manufacturing gold did not waste their time, as the science of chemistry is based upon results they produced. He says "there is ground for thinking that gold can be made out of silver or other metals," and that it is not "scientifically improbable."

California Miners' Association Convention.

The Sixth Annual Convention of the California State Miners' Association was a very important one to the mining interests of the State and coast. Contrary to prior belief in some quarters as to results, it was the largest, most interesting, most enthusiastic, most representative of any of the annual conventions, and transacted at least as much business as any one of the preceding five annual meetings. The wisdom of its deliberations was manifested throughout.

The Association wisely retains its old president, and refuses to commit itself to any wide departures from the policy and purpose that caused its creation. It recognizes the importance of county organization, the necessity for financial aid and personal individual interest on the part of these county organizations; and it is to be hoped that in every mining county in California the co-operative work of the Association will receive hearty and cordial support. The red life blood of actual individual interest is needed, personal contact is required, and the feeling must be made universal throughout the State that the interest, well being and individual prosperity of every miner, mine owner and mine worker in California is wrapped up in the California State Miners' Association.

As usual the Association was honored by the presence of many distinguished citizens of the State, including United States officials, who spoke encouragingly on many topics of immediate interest to the Association. The subject of revision of Federal mining laws—which promised to assume considerable importance—was prominently brought to the front at the start, but was deemed too large a field to exploit while other subjects, on which the Association showed more unanimity and which were deemed to be of more local importance, required discussion. The building of restraining dams, the expenditure of the $800,000 already appropriated for that purpose and river improvement, and in general the specific department of hydraulic mining, occupied the greater part of the time of the convention; and in this regard it may be said that there was less talk and more work than is customary in a convention of this nature.

The matter of local mining legislation, the mineral exhibit at the coming Paris Exposition, the mineral land bill and the creation of a Department of Mines and Mining in the National Cabinet are among the subjects that will receive attention at the hands of the special committee appointed during the year.

It is to be remembered that these annual gatherings of the California State Miners' Association are largely to hear what has been done during the year and to formulate plans for the coming twelve months. The work of the Association is not done in the convention; the actual work of the California State Miners' Association goes on day by day continuously. It is in the hands of an executive committee, composed of representative mining men from all over the State, and is also delegated to special committees which are in continuous session. These committees make their annual reports and carry on the work of the Association without a break.

The complaint on the part of some of the counties that they are not represented, is entirely their own fault. All that the miners in any county in California need do to have full representation is to organize a County Miners' Association in accordance with the rules of the California State Miners' Association, and they will receive full recognition in the executive committee and all other committees of the Association. They cannot help others without helping themselves, and in no way can more be done for the mining industries of the State of California than in being in active accord with the California State Miners' Association. It knows no county limits, it has no interests to serve, no man in it works for pay. Everyone that works with the Association is actuated by but one motive, and that is, to aid the industry without hope of personal reward, but with the ambition to do what he can, honestly and sincerely, to forward the just claims of the miners of the State and to enable them to work their property without injury to the interests or property of anyone else.

The Sixth Annual Convention of the California State Miners' Association met in Odd Fellows Hall, in San Francisco, at 10 A. M., Monday, October 18th, Hon. Jacob H. Neff of Placer county presiding. The Committee on Credentials reported the following delegates entitled to seats:

Alameda County.—E. H. Benjamin, T. W. Jeffress, L. Bridges, A. W. Bishop, A. H. Rickett, J. B. Eldridge, J. L. Lyon, N. T. Farrar, John Daggett, Thomas Mein, K. A. Hughson, J. S. White, J. R. Scupham, M. Webber, J. T. Bradly, S. B. Christy, W. R. Thomas, C. B. Rutherford, R. W. Snow, F. A. Leach, C. E. Gillett.

Amador County.—R. C. Rush, J. F. Parks, Hiram Deacon, C. R. Downs, J. E. Dye, A. McWayne, T. B. Dillon, R. Robertson, W. I. McGee, J. A. McIntire. J. B. Francis, M. J. McDonald, W. R. Thomas, C. Bradshaw, F. Frates, J. Graham, E. S. Barney, Senator E. C. Voorheis, J. B. Treadwell, Thomas D. Calkins, John R. Tregloan, A. Caminetti, Dr. Thomas Boyson, A. J. Crain, W. F. Detert, W. S. Weymouth, J. Trustcott, J. F. Davis, J. E. Barnes, D. Gutman, V. W. Gaskill, A. B. McLaughlin.

Butte County.—W. E. Duncan.

Calaveras County.—P. Eley, Richard A. Parker, W. L. Honnold, J. E. M. Lorley, H. A. Messenger, Mark B. Kerr, O. Dolling, J. H. Smith, P. L. Schuman, W. T. Robinson, W. N. Clary, Jr., J. Burt, Judge C. V. Gottschold, W. C. Howard.

El Dorado County.—D. H. Jackson, N. E. Picket, C. A. Swisler, J. C. Diamond, G. H. Burnham, G. M. Clark, J. F. Armstrong, S. J. Alden, D. B. Mason, A. Mierson, J. Smith, A. H. Ten Broeck, John Brown, W. Leadon, G. W. Raymond, J. H. Barnard, John Thiesen, Thomas Clark, J. J. Crawford, R. S. Raw, J. Richards, H. S. Morey, John Morrow, W. W. Mountain, R. V. Robertson, C. N. Weatherwax, R. Rowland, F. F. Barss, J. H. Moss, F. Adams, E. A. Stent, Louis Barrington, C. H. Dunton, Taylor Gearhurt, A. A. Woods.

Los Angeles County.—F. M. Edelstein.

Nevada County.—D. McPhetres, W. L. Mobley, C. F. Hendricks, H. Schroder, O. K. Cluidman, F. W. Banks, C. L. Miller George Fletcher, James Hoskins, W. A. H wley, S. Granger, W. F. Prisk, J. P. Shoemaker, F. Dulmaine, J. M. Lakenan, C. W. Kitts, E. H. Brown, J. Weissbein, M. J. Farrell, T. Simmons, L. L. Myers, C. F. Hegarty, C. D. Eastin, P. S. Cramm, M. Maguire, James Chisholm, P. Campbell, J. F. Kidder, E. Briggs, J. P. Melville, H. B. Diggles, W. Shelby, C. D. McLean, J. F Lang, H. Daniels, W. C Connell, I. W. Hayes, C. Brockington, T. W. Carson, R. Stenson, Thomas Dunkley, George Fletcher, R. Thomas, A. D. Bigelow, C. O. Jepsen, J. C. Goodwin, E. T. Worthley, J. S. McBride, A. D. Foote, George Mainhart, H. L. Bush, James Tyrrell, E. W. Donnelly, E. C. Morgan, J. P. Zipi, M. Sp oul, C. H. Mitchell, W. Bray, John Greaney, John Eddy, James Bennallack, J. M. Thomas, W. J. Mitchell, Henry Fuchs, Fred Zeitler, G. C. Gaylord, F. E. Wadsworth, W. W. Waggoner, W. W. Mather, William Floyd, J. J. Jackson, F. Page, William Mather, Dahl Nivens, W. A. Dennis, Gus Kartschope, Peter Tautphaus, George E. Turner, A. Cornell, Joel Andrews, William Campbell, Louis Dorsey, W. F. Englebright, F. Searles, G. A. Nihell, R. C. Walrath, E. J. de Sabla, J. T. Morgan, Henry Lane, Charles Stepp, J. M. Buffington, W. H. Tuttle, W. H. Martin, H. F. Shockley, Joseph Fetz, N. P. Brown, J. V. Hunter, C. J. Naffzeiger, Richard White, August Guillaume, D. B. Marwick, William McKinley, F. Eilerman, J. M. Walling, E. J. Rector, S. W. Marsh, George Hethersol, A. Isoard, D. McFall, J. S. Gregory.

Placer County.—L. Balliet, J. L. Gould, W. Rablin, J. Nicholls, L. Tetzlaff, H. H. Hudepohl, E. A. Moody, C. H. Carr, J. Stewart, J. H. Neff, H. Lobner, H. Disque, Ivan H. Parker, Amos Stevens, William Rule, George McAulay, F. H. Green.

Plumas County.—J. Thomes, B. C. Lorich, A. D. White, C. R. Thompson, W. J. Edwards, W. W. Kellogg, J. C. Coburn, S. R. Hall, S. W. Cheyney, William Metcalf, Dixon Bradshaw, William Schuld, Dr. F. N. Folsom, Arthur Price, C. D Hazard, James Jones, Thomas Price, John Nevills, P. Lawrenzi, John Roberts, C. E. McLaughlin, J. H. Frisseli.

Sierra County.—J. M. Harper, Charles P. Gale, Paul Meroux, H. W. Orear, H. H. Squire, John Scott, S. F. Purdy, J. W. Orear, Frank R. Wehe, Tirey L. Ford, Ed F. Wehe, Lewis F. Byington, William H. Byington, Louis Rosenfeld, Mason W. Mather, J. O. Jones, E. A. Meily, William L. Cole, W. F. Page, James McGregor, John Myers, A. B. Moulder, Julian Sonntag, Claud T. Hamilton, Andrew Carrigan, G. M. Sayles, I. Copeland, Frank L. Cole, Stanley A. Smith, J. A. Vaughn, D. T. Cole, J. F. Cowdery, M. H. Mead, Henry Kingdon, J. Westall, H. Spaulding Sr., W. H. Esbacher, J. K. Wiggins, John Costa, P. San Francisco County.—A. J. Ralston, T. J. Parsons, Julian Sonntag, W. C. Ralston, S. W. Backus, Edward A. Belcher, S. K. Thornton, Andrew Carrigan, Hugh Craig, John Coleman, C. W. Cross, H. T. Lally, J. O'B. Gunn, Col. George Stone, J. M. Wright, B. T. Lacey, Charles Watt, D. B. Pike, I. S. Foreman, C. Barbour, P. George Gow, R. R. Grayson, S. J. Hendy, Robert McMurray, J. F. Halloran, C. H. Lindley, A. Scott, W. W. Montague, Henry Pichoir, S. Mooney, J. L. Rathbone, George Schmidt, Charles Allenburg, R. C. Sargent, Samuel C. Irving, Judge Niles Searles, D. E. Hayes, Tirey L. Ford.

Trinity County —John McMurray.

Tuolumne County.—A. M. McDonald, John N. Neals, F. M. Wilmans.

Yuba County.—J. C. Campbell, W. J. Mellon, F. K. Lord, W. R. Meek, C. C. Mayo, Frederick Joubert, J. E. Poingdestre, Daniel Cettins, J. H. Drake, Joseph Hibbert, C. S. Holbrook, Otto Woehler, T. J. Sherwood, F. W. Johnson, James O'Brien, Louis Comath, W. C. Halstead, A. C. Wheaton, C. L. Armstrong, John McQuaid, W. W. Chamberlain, John Peardon, George A. Morris, R. H. Postlethwaite, Thomas Conlin, Joseph Durfee.

The veteran Judge Niles Searls in an eloquent address on behalf of the Association, presented the President with a massive silver loving cup, gold lined, and suitably engraved, as a token of the esteem of the miners and their appreciation of his years of leadership as President of the Association from its first day, to which President Neff made suitable response.

Secretary Sonntag read his report, showing the receipts for the year up to October 15th, 1897, to be $3,374 and the expenditures $2,497. Since then El Dorado county has sent in $100, Nevada county $150, Placer county $150, Calaveras county $20 and others making the total net amount on hand $1,397. He also reported that during the year the Executive Committee held six meetings.

Treasurer Montague's report tallied exactly with the Secretary's. Both reports were received and adopted. The usual letters were read. President Neff delivered his annual address. The Committee on Legislation made its report; as did likewise the special Committee on Revision of the Federal Mining Laws; (see pages 383 and 384.

President Neff appointed a Committee on Resolutions to which all resolutions offered during the meeting were to be referred without debate.

The Committee on Revision of Mining Laws made report as follows:

To the President and Members of the California Miners' Association:

GENTLEMEN.—Your Committee on Revision of Mining Laws appointed by J. H. Neff, president of the Association, respectfully submit the following report of their action since their appointment:

The duties of the committee as originally appointed were limited to suggestions concerning amendments to Federal laws, but at the request of the Committee on Legislation the Committee on Revision of Laws investigated the large amount of proposed legislation and it delivered its report to the Executive Committee.

The committee did not feel authorized to make any recommendations to the Le islature; but from time to time during the session of that body presented for the consideration of the Executive Committee their individual views.

At a meeting of the Executive Committee a resolution was adopted as follows:

Resolved, That it is the sense of this committee that the proposed legislation supplemental to the provisions of the Revised Statutes, relating to the acquisition and enjoyment of mining rights upon the public domain, be confined to the following purposes:

1. The enactment of a law providing for the recording of notices of location and making such notice when recorded prima facie evidence of the facts therein recited.

2. The enactment of a law allowing the discoverer of a lode claim sixty days from the day of his discovery to perfect his location and mark his boundaries.

3. The enactment of a law providing for the deposit with the County Recorder of the several counties of all district records heretofore existing, making such County Recorder legal custodian of such records and authorizing copies certified by such Recorder to be admitted as evidence with like effect as if certified to by the original custodian of such record.

4. Making provision for the amendment of location notices where the originals are defective.

5. Providing for the proof of annual labor by affidavit filed with the County Recorder on the lines of the existing laws.

Acting upon these suggestions, the committee did not consider any proposed legislation beyond the scope defined in said resolution.

The existing law, passed by the Legislature in March, 1897, reflects to some extent the views of the Executive Committee.

With re erence to the proposed amendments to the Federal laws, it became manifest to the committee that no Federal legislation could be secured unless the co-operation of all the mining States and Territories was assured.

At the Gold Miners' Convention, which was held at Denver on July 7th of this year, W. S. Keyes was a delegate, having been appointed to that position by the Governor of this State. He was also a delegate to the Transmississippi Congress, held at Salt Lake City on July 14th of this year. He was also appointed by Governor Prince, president of the Miners' Convention, as a member of the committee, representing California, to formulate proposed amendments to the Federal mining statutes. The committee of the Denver Convention, consisting of delegates from all the States, met at Denver on September 22nd and 23rd, and there discussed and outlined certain proposed amendments to the Federal law.

As Mr. Keyes, who was a member of the Committee on Revision of Laws of this Association, was present at the meeting of the general committee at Denver, participated in its deliberations, and is familiar with the results obtained, we have requested him to present for the consideration of this convention a report as to the action of the Denver committee and the suggestions made by it. Such report may then be referred to the new Committee on the Revision of Laws, to be appointed by this convention or its president Respectfully submitted,

C. W. Cross, R. E. Browne, W. S. Keyes, T. L. Ford, J. F. Halloran, H. Pichoir, Fred Searls, A. H. Ricketts, Committee; CURTIS H. LINDLEY, Chairman.

In connection with the above, Col. W. S. Keyes made a report in which he offered the following for adoption by the convent on, they being the expression of what had been agreed on at the Denver congress:

Resolved, That the existing statutes of the United States touching mineral lands require radical amendment.

Resolved, That the law of the apex and its corollary, the so-called extra lateral right, should be abolished and a return made to the common law right of surface boundaries, and that the claim of unit of location be of sufficient width *i. e.*, of sufficient width on the side of the dip to permit of excavations on the ledge to a depth of 1800 or 2000 feet when the angle of the dip is not less than 45°.

Resolved, That the local rules and regulations ought to be abolished.

Resolved, That the Congress of the United States be petitioned or requested to formulate a complete mining code, touching all matters from the inception of the claim (location) to the final acquisition (patent) thereof.

Resolved, That the process of applying for and obtaining patent should be simplified and made less costly to the miner.

Resolved, That section 2323 of the Revised Statutes relating to the so-called tunnel locations be restric ed in its application to the deep placers or dead rivers whose course and direction are not shown upon the surface by reason of accumulations of drift, soil, lava or other rock. A tunnel for the discovery of such deposit or deposits must be prosecuted with due diligence, and proof of such diligence shall be held to mean work upon the tunnel for not less than four months in each year, with at least two shifts of workmen. The channel, deep placer or dead river, when encountered, to be locatable to the extent of not more than 1500 feet up and down stream from the point of intersection by the tunnel.

Resolved, That all the precious or useful metals, earths, rocks, stones, fossils, mineral oils, bitumens, natural gas, hydrocarbons, natural fertilizers—in a word, any substance found within or beneath the surface of the earth and having a commercial value—should be subject to location under the section or sections of the law applicable to placers.

Resolved, That any party or parties who may desire to avail him or themselves of the provisions of the present laws must apply for patent before January 1, 1900. A failure to so apply shall constitute a forfeiture of all such claim or claims and thereafter they shall be open to location as other public mineral lands. Provision should be made so that mineral land so abandoned may be located preferentially by a neighboring claim, whether possessing a square location or not, if such land be claimed located within a reasonable time—say within six months—and no other location shall be allowed during said period unless such neighboring claim owner shall, in writing, have declined to take up such abandoned ground.

Resolved, That a committee consisting of members of this convention be appointed by the President to formulate in detail the provisions of a bill in accord with these resolutions, to be placed in the hands of our Senators and Representatives in Congress, with a request to urge its passage in the next Congress.

The resolutions were referred to the Committee on Resolutions.

Pending the report of that committee the convention adjourned until 10 A. M. October 19th.

During the evening of the 18th there was delivered an address by Professor Christy of the mining department of the State University at Berkeley on the treatment of low-grade ores by the cyanide process and an address by W. F. C. Hasson of San Francisco on the transmission of electric power, both lectures being illustrated.

Professor Christy said that it cost about 8 cents to work a ton of tailings or low-grade ores in general by the cyanide process.

Lieutenant Hasson said that the application of electric power in the working of mines was rapidly on the increase. Electric motors for milling and pumping were pronounced successes. The mountains of California contained plenty of water at high altitudes that can be used to generate electric power cheaply, and in the past three years the generation of electricity by water power and its transmission for long distances had made rapid strides.

Upon convening the following morning at 10 A. M. the Committee on Resolutions made its report as follows:

To the Officers and Members of the California State Miners' Association: Your Committee on Resolutions begs to submit the following report:

First—On the several resolutions proposed in the report of General W. S. Keyes, herewith returned to the convention, the committee report as follows: Without expressing any opinion upon the merits of the question presented in the resolutions recommended in said report, your committee recommends non-action upon the same, upon the ground that the Association should bend its energies to the completion of unfinished business already engaging the attention of Congress at its request, and upon which there is unanimity among its members, before proceeding to the consideration of new matters covering so vast a field of discussion and probable contention. We believe it of more importance to concentrate our efforts upon the accomplishment of legislation admitted to be imperatively demanded than to weaken our advocacy of any measure by attempting to promote legislation upon too many subjects.

Second—Mr. Sherwood's resolution concerning a conference with the Executive Committee of the State Anti-Debris Association the committee has fully considered, and report the following substitute therefor and recommend its adoption:

Resolved, That it is the sense of this convention that the Executive Committee to be appointed at the close of this convention immediately appoint a sub-committee of three of its members, whose duty it shall be to confer with the Executive Committee of the State Anti-Debris Association, and request its co-operation in urging upon the attention of the United States Debris Commission the importance of procuring immediate protection against a further flow of heavy material into the navigable rivers by the construction of restraining barriers in accordance with such plans as may be indorsed by the said United States Debris Commission, and that said sub-committee is directed to report to the Executive Committee of this Association at their next meeting the result of such conference.

Third—The resolution of Mr. Myers concerning the mineral exhibit at the Paris Exposition has been considered and a substitute as follows recommended for adoption by the convention:

Resolved, That it is the sense of this convention that the miners of California should make a mineral exhibit at the Paris Exposition in the year 1900 which will fully display the varied and valuable resources of this State. And the President is hereby authorized and requested to appoint a committee of five to take into consideration the best method of accomplishing this purpose. Said committee is hereby empowered to confer with State and other organizations contemplating making exhibits at said exposition, and to co-operate with the same in effecting arrangements for such exhibition. Said committee is directed to report its conclusion and action to the Executive Committee of this Association.

Fourth—The resolution offered by Secretary Sonntag in relation to annual visits of certain officers of this Association to mining centers is herewith returned with the recommendation that it be adopted.

Fifth—The resolution concerning the invitation to the President of the California Good Roads League is herewith returned without recommendation.

Sixth—The committee report the following resolutions and respectfully recommend their adoption:

Resolved, That the Committee upon the Revision of Federal Laws be and is hereby instructed to draft a bill for the consideration of Congress which shall define hydraulic mining as the same is defined by the provisions of the Civil Code of the State of California.

Resolved, That the Executive Committee be requested to formu-

late for the use of the Secretary of the Association a circular letter stating the work accomplished by the California Miners' Association, and setting forth the plan of operations for the ensuing year. The Secretary is hereby instructed to circulate the same among miners and business men throughout the State.

Resolved, That the thanks of this Association are due and are hereby extended to the officers of the California Miners' Association for the earnest, intelligent and effective services rendered by them during their term of office.

All of which is respectfully submitted:

T. J. Parsons, J. F. Halloran, A. M. Ten Broeck, H. T. Power, A. Caminetti, F. R. Wehe, J. F. Davis, John McMurray, James O'Brien, J. K. Scupham, J. M. WALLING, chairman.

The second section of the report was argued at great length during the morning session. Postponement of the debate was made to listen to a speech from Congressman De Vries of the First Congressional District, who said the Public Lands Committee, of which he is a member, has the House bill under consideration and will doubtless report favorably upon it. It will, in all probability, be passed by Congress. The Congressman said he believed that if any delay is occasioned in the building of restraining dams with the $50,000 appropriated by the State Legislature and Congress it will be due to the engineers who are deliberating over plans. He has urged them to proceed as speedily as they can. He is heartily in sympathy with the miners, and suggested that the convention express by resolution its wishes in relation to the Mineral Lands bill and the construction of impounding dams.

The debate on the resolutions was then renewed. During a lull in the animated discussion, United States Senator George C. Perkins was called upon and delivered an address, stating all that had been done for the miners in Congress; and pledging himself and the entire congressional delegation of the State to do all that could be done at Washington to further their just interests.

Senator Perkins paid a glowing tribute to Major Heuer and then to the miners in general, declaring that there would have been no California if there had been no mines. The farmer could no more live without the miner than the miner could live without the farmer. Therefore, the subject of mining and the restraining of debris should be discussed from a mutual standpoint. He was glad to see representatives of the agricultural interests in the convention. He assured the convention that the California delegation in Washington would willingly serve the Association in the halls of Congress if only the members would agree upon what they want. The Mineral Land Act was before Congress and would become a law within sixty days after the next convening of Congress. He explained the difficulties in the way of getting legislation through Congress. There was so much of it that it was often impossible to get bills through promptly. The miners should not get weary if there should be delay. Senator Perkins said the miners would not be able to get a Cabinet officer at the head of a department of mining. That, he said, was not practicable; but the miners could get a Commissioner of Mining. That would accomplish all that the miners desired.

Major Heuer of the United States Debris Commission who has just returned from a two years station at Cincinnati, was also asked to address the convention and did so, stating in effect that upon the United States Engineering Corps devolved the additional duties of the Debris Commission and that they were proceeding as rapidly as circumstances would permit. But he desired to remind the miners that he had not sought the appointment, which had been thrust upon him and his colleagues.

"I did not come here to make a speech," said Major Heuer: "I just heard something about military men being on the Debris Commission, but the work was forced on the military men, and they have done the best they could for the miners.

"The North Bloomfield mine has been referred to here as having been stopped after it had built a dam. That is true; but we did not officially know that there was a dam. It would have been easy for them to have secured a permit. The Debris Commission was appointed because the Caminetti law required it to be appointed.

"The river and harbor laws prohibit anybody putting anything into the navigable streams to impede navigation, and if the Debris Commission does not take notice of other things it is because no complaints have been brought to it. If so they would have taken the complaints to the District Attorney."

John P. Irish, representing the San Francisco Chamber of Commerce and Board of Trade, addressed the convention in relation to the proposed department of mines and mining, and, in a long and eloquent address, pointed out the need of such department. He disagreed with Senator Perkins as to being content with a "Commissioner of Mines," and favored the appointment of a Cabinet officer to control mining matters. If a commissioner were to be appointed, it should be with the distinct understanding that a Secretary of Mines and Mining would follow. Concerted action with Eastern miners, he said, was necessary to insure the success of the plan.

Governor Jas. H. Budd was the next speaker, who, amid much applause, said:

"As long as I am Governor of the State of California I will be pleased to come before you and ask: How can I serve you? I am largely under obligations to the miners of this State for my election to the chair of Governor, and hope to be able to repay you in some way. I have never refused my signature to a just bill placed before me which the miners had prepared for passage. I have kept my pledge to the State and to the miners, and will continue to do so. To have a Department of Mines is your main object of convening here. Now is a good time to press the question, and I assure you I will give all the help that is in my power. It is time we should know what regulations are to govern the gold and silver mines of this State. I will not be your Governor for a great length of time, for I would not take a second term under any consideration. I intend to retire as a private citizen, and will then, as now, say if I can be of any assistance to you, simply say the word, and I will respond with a will."

Congressman J. A. Barham of the Second Congressional District was the next speaker. He also declared his belief in the timeliness of the request that a new Cabinet position be created. The products of all kinds of the mines of the United States amounted annually to $700,000,000, and were worthy of special governmental protection and direction as in other countries.

"At all times," said Mr. Barham, "I have to the extent of my ability presented the claims of the miners in the halls of Congress and shall continue to do so. Whatever I can do to help procure a Secretary of Mines and Mining, I will do. This department will not be for gold and silver mines alone, but for mines of every character. The mining industry is as much entitled to consideration as any in the country. The Mineral Lands bill was once passed by the House, and will become a law at the next session of Congress, I have no doubt. The Idaho-Montana Mineral Lands bill is the one we want, and Speaker Reed informed me that he is in favor of it. The Senator from Oregon assured me that at the next session he would not tack on the Oregon amendment, which has held the bill back heretofore."

After these speakers, the convention again took up the discussion of the resolutions, the result being their partial adoption. The section was changed to read as follows:

Resolved, That it is the sense of this convention that the Executive Committee to be appointed at the close of this convention immediately appoint a sub-committee of three of its members, whose duty it shall be to confer with the Executive Committee of the State Anti-Debris Association, and request its co-operation in urging upon the attention of the United States Debris Commission the importance of procuring immediate protection of the navigable rivers of this State by the construction of restricting barriers as provided for by that certain Act of Congress known as the Caminetti Act, and for the purposes mentioned in said Act, and in accordance with such plans as may be indorsed by the said United States Debris Commission, and that said sub-committee report to the Executive Committee of this Association at their next meeting the result of such conference.

Ex-Congressman Caminetti introduced the following resolutions, which were adopted:

WHEREAS, The National Government has appropriated $250,000 for the building of impounding dams for the protection of the navigable rivers of the State, under the provisions of Section 25 of an Act to create the California Debris Commission and to regulate hydraulic mining in the State of California, approved March 1, 1893; and

Whereas, The State of California has likewise made an appropriation of a like amount for such purpose;

Whereas, The State of California has also made an additional appropriation of $300,000 to be used in the improvement of the navigability of said rivers;

Whereas, The money so appropriated by Congress and by the State remains unexpended, while the injuries resulting from a lack of restraining works are being constantly aggravated;

Whereas, No more important work can engage the attention of the department having the expenditure of the appropriation made by the United States than the immediate construction of said impounding dams; therefore, be it

Resolved, By the California Miners' Association, that the Secretary of War and the Chief Engineers, U. S. A., be and they are hereby respectfully requested, as far as is consistent with their duty, to cause the preparation of plans and the construction of said impounding dams as early a date as possible; be it further

Resolved, That the members of the California delegation in Congress be and they are hereby requested to present in behalf of this Association these resolutions to the Secretary of War and the Chief of Engineers; be it further

Resolved, That copies hereof be transmitted to said Secretary of War, Chief of Engineers and the California delegation.

The important discussion on the recommendation of the Committee on Resolutions that the Committee on Revision of Federal Laws draft a bill for Congressional definition of what "hydraulic mining" is, was closed by the adoption of a motion that the matter be referred to a special committee with instructions to present no bill to Congress unless it had the express sanction of the Executive Committee of the Association.

The Committee on Dredgers then presented the following report, which was read by John M. Wright:

SAN FRANCISCO, October 18, 1897.

To the President and Members of the California Miners' Association:

Your Committee on Dredgers appointed at the time of the last meeting of your Executive Committee has not had time to make such an exhaustive examination into the subject of river dredging and into its cognate subject of river jetties, as it will be necessary to make before the miners of California can derive practical benefit from the operation of a combined system of jetties and dredging in the Sacramento river.

In the opinion of your committee, while it is desirable to construct a system of restraining dams to hold back the *debris* already accumulated from former hydraulic mining, pending the investigation of the subjects of jetties and dredgers, yet such restraining dams will not avail to any large extent in bringing about the results this Association was primarily organized to promote, namely, the restoration to the hydraulic miner of his right to use and enjoy his own property to the full extent of its value—a privilege not denied to the owner of any other class of property.

Notwithstanding the short time in which your committee has been able to work, still your committee has collected a large amount of valuable data regarding the subjects entrusted to its care, which, with other material yet to be collected, will be systematically treated in the future reports of your committee; and your committee is able to assure the miners of California that it is quite among the probabilities of the near future, not only that the owners of a few small hydraulic mines may mine here and there in secluded gulches of the Sierras under the fostering care of the California Debris Commission, but that by the establishment of a proper system of jetties in the Sacramento river, supplemented by the use of powerful dredging machines such as have been recently constructed at Government expense, hydraulic miners everywhere may mine without fear of the *baton* of the marshal and without objection from their friends and neighbors, the farmers.

It is true that large amounts of money must be appropriated and employed, but such amounts are infinitesimal when compared with the vast benefits to result, and, considering the now universal interest in the subject of mining and the generous aid already extended by both the State and National Governments in the way of mere experiments, it can scarcely be doubted that at no distant day the authorities of the National Government will provide liberally for the improvements indicated.

To illustrate the efficiency of the dredgers recently constructed for the Government, your committee refers to Appendix WW of the Annual Report for 1896 of the U. S. Chief of Engineers, from which report your committee quote the following, showing the performances of the dredge "Alpha."

"Early in September, owing to the steady decline of the river, the services of the Alpha were needed at four localities between Cairo and Memphis, viz., Cherokee Crossing, Sam Phillips Bar, Point Pleasant Bar, and Medleys. She was immediately started from Memphis and reached Cherokee Crossing, the first obstruction to navigation above Memphis, on the morning of September 12, and worked there sixteen days. During this time she made six cuts, aggregating 2350 feet in length, and increasing the navigable depth 3.62 feet. Not less than 6 feet was found in the channel during the rest of the season, notwithstanding a fall of 2.45 feet in the river subsequent to the dredging. The material encountered at Cherokee was usually coarse and hard to move.

"From there the dredger was towed to Sam Phillips Bar, where work was commenced on September 30. In ten days four cuts, aggregating 3845 feet long, had been made, and the navigable depth increased 1.68 feet. Not less than 8½ feet was found in the channel during the rest of the low-water season, although the river fell 2.07 feet subsequent to the dredging.

"At Point Pleasant Bar work was commenced on October 9 and continued fourteen days, during which time eight cuts, with an aggregate length of 3520 feet, were made, and the navigable depth increased 3.50 feet. Not less than 9 feet was found in the channel during the rest of the season, notwithstanding a fall in the river of 1.39 feet subsequent to dredging.

"At Medleys work was commenced on October 25 and continued twenty-three days. The material here was also very difficult to handle, from its extreme fineness rather than its coarseness, as was the case at Cherokee. Here it fed in toward the dredge from long distances ahead and on both sides, assuming an extremely flat slope. Three cuts were made, with an aggregate length of 3020 feet, by which the navigable depth was increased 2.13 feet. Not less than 10.65 feet was found in the channel during the rest of the low-water season."

Your committee also quote from the same report part of the history of the building and of the performances of the dredge Beta as follows:

"But while the practicability of improving the low-water navigation of the Mississippi river by dredging may be considered as established, there is much yet to be learned concerning the best arrangement of parts and details in a dredge for this purpose, as well as the system of operating it, including the motive power, the method of attack on the bar, the relative dimensions of the cut and the disposal of the excavated material. These questions can only be settled by experience acquired with the use of specially designed and strongly constructed dredges of great capacity.

"These considerations had weight with the Commission in specifying the requirements for the dredge Beta. A capacity of 1600 cubic yards of sand per hour delivered 1200 feet from the point of excavation was demanded. This was far beyond the performance of any dredge ever built. A bonus proportioned to the increase of output beyond the fixed rate, up to 2400 cubic yards of material per hour, was offered to the dredging class of boilers and machinery was specified. A width not exceeding 40 feet and a draft not exceeding 4½ feet was allowed, leaving the length of the hull to be adjusted to the weights. It was constructed 172 feet long.

"The contract time for completion, ready for testing, was August 1, 1895. The other general requirements for this dredge, as adopted by the Commission, may be found in the annual report of the Mississippi River Commission for 1895.

"On the recommendation of the dredging committee of December, 1894, as authorized by resolutions of the Commission of November 13, a contract was made with Mr. Lindon W. Bates, of Chicago, for the construction of a dredge in accordance with these general requirements, provided with six 5x5-foot cutters, revolving on vertical shafts, actuated by spur gear and divided into two batteries. She was to have two double-entry centrifugal pumps, with 7-foot runners, and two 32-inch suction and discharge pipes, all so arranged as to form two separate units from the heads of the suctions to the ends of the floating discharge pipes, 1000 feet away from the dredge. The amount of the contract was $172,775, provided that a rate of delivery of 1600 cubic yards of sand per hour was attained. The bonus was $86,387.50, if the rate of delivery of 2400 yards per hour was reached, and proportionate amounts for intermediate rates of delivery. A penalty of $250 was imposed for each and every day's delay. This contract was not finally approved by the War Department until February 23, 1895."

SCHEDULE OF TESTS OF THE "BETA."

Number.	Duration of tests, seconds.	Sand and water, in cubic feet.	Sand, in cubic feet.	Per cent of sand.	Velocity in pipe, in feet per second.	Rate of sand delivered per hour, in cubic yards.
1	35	8,641	228	2.64	20.77	868
2	68½	9,698	1,465	15.10	11.89	2,847
3	38½	5,147	1,780	34.58	11.60	6,354
4	64⅞	10,606	2,427	22.80	19.76	4,988
5	26½	4,183	1,528	36.40	13.47	7,798
6	55¾	9,251	2,028	21.92	13.97	4,850
7	53⅞	8,975	1,378	17.43	14.03	3,872
8	50½	8,113	2,356	29.00	13.52	6,217
9	51⅝	8,451	2,438	28.85	13.85	6,327
10	49⅞	8,494	1,826	21.50	14.92	5,083
Average				23.02		4,921

"The dredge was thus proved to be of immense capacity, delivering as the average of tests quite three times the volume of sand demanded by the contract, and twice that required to earn the entire bonus."

As to the general result of its experiments with dredgers, the Commission states the following:

"It appears therefore, from the experience of the Commission with the dredge Beta, that the capacity which can be given to such machines for the purpose of bar removal on the Lower Mississippi is very great. This goes far to establish the feasibility of an improvement of navigation by dredging, since it can not be doubted that the resources of constructive science are sufficient to adjust the parts of a dredge so perfectly and to build them up so strongly that she will be substantially free from delays from accident, and to proportion a hull so that it will float its machinery on a draft which will allow it to navigate the river at its lowest stages."

Your committee recommend that the work of your committee be entrusted to a committee under the name of Committee on Dredgers and Jetties, with instructions to vigorously prosecute its investigations and to report the results thereof to the Executive Committee without delay.

W. C. Ralston, J. F. Halloran, JNO. M. WRIGHT, Chairman.

The report was adopted.

The following report from the Committee on Mineral Lands was read and adopted:

SAN FRANCISCO, Oct., 18, 1897.

To the President and Members of the California Miners' Association:

Your Committee on the Protection of Mineral Lands has the honor to report that the past year has been one of inactivity with it, as the well known conditions existing at the commencement of its year have remained practically unchanged, except in the marked diminution in the area of advertised selections by the railroad companies of lands lying within the limits of their grants. Against such advertised selections no protests, under the rules of July 9th, 1894, have been filed on behalf of this Association, as the acreage was comparatively inconsequential. In any event, this committee has no way of meeting the requirements of the Department of the Interior in the protest cases of Benjamin vs. Southern and Central Pacific Railroad Companies, reported in Volume 21 of the Decisions of the Department of the Interior, page 387, in which it was said that where no specific allegation was made of the presence of mineral in any particular subdivision covered by a railroad company's selection, there was no necessity for ordering a hearing or further suspending the issue of patent therein.

The advertised lists of railroad selections during the past committee year, as given it by the professional clipper, are filed herewith. All of which is respectively submitted.

E. C. Loftus, J. F. Halloran, H. T. Power, E. H. Benjamin, A. H. RICKETTS, Chairman.

Mr. Cooper of the California State Mining Bureau said that it was the intention to issue a register of the mines and miscellaneous economic minerals of the State, and to classify the mines in their general nature, as quartz, hydraulic, drift, placer and beach, and give the location and particulars of a public nature of each mine. The register will give the location and character of title of each mine; the strike, dip and thickness of the veins, the nature of the ore, the character of the walls, the number of men employed, and other facts of general interest. It will show the amount of development done, depth of shafts and length of tunnels. The register will also contain a list of quartz mills and reduction works, and will be accompanied by a map of each county, compiled from most reliable and recent available data. In order to complete the register up to date as nearly as possible, a deputy will be appointed in each county. As soon as the conditions will permit, bulletins will be issued on the following subjects: "Chlorination," "Dry Washing," "Beach-Washing," "Dredging," "Building Stones," "Petroleum," "Limestone" and "Cement."

In the evening Professor Geo. Davidson delivered an illustrated lecture on Alaska, discussing its leading physical features and resources.

The following resolutions were also reported on favorably by the Committee on Resolutions and adopted by the Convention:

Resolved, That it is the sense of this Convention that the lien law of this State be amended so as to secure to the laborer who labors upon, and to the material man who furnishes material for any mining claim in this State, located on lands held under an agricultural patent, a lien upon the said property as security for any wages due, or the price of material furnished, in the same manner as such laborer or material man now has upon a mining claim to which the claimant has acquired the right of possession by a compliance with the laws of the United States, and of this State, and the local rules and customs of miners, and the Legislative Committee of this Association is hereby instructed to urge the said measure upon the Legislature at its first session.

Resolved, That a special committee of five be appointed by the President to act in conjunction with like committees from other bodies and conventions in behalf of an executive department of mines and mining, the secretary whereof shall be a member of the President's cabinet.

Resolved, further, That all papers, documents, resolutions and other matters pertaining to the foregoing subject be referred to said committee, which said committee is hereby requested to act in conjunction with other like committees, and to use all honorable means to obtain such national legislation as will secure the desired result.

A resolution favoring the preparation of a State mining exhibit at the Paris Exposition, and another calling for the creation of a national department of mines and mining and the appointment of a Cabinet officer, and a resolution requesting Congress to pass the Mineral Lands bill were adopted.

Resolutions were also adopted thanking Professor S. B. Christy, Lieut. W. F. C. Hasson and Professor George Davidson for the instructive and interesting lectures delivered by them before the Association.

The morning of Wednesday, the third day of the convention, was devoted to the election of officers. Hon. J. H. Neff, for the sixth time, was unanimously elected president of the Association. For the position of vice-president the names of T. J. Parsons and Col. Geo. Stone of San Francisco were presented. Balloting ensued, but before the result of the vote was announced, Col. Stone moved that the vote for Mr. Parsons for vice-president be unanimous. Mr. Parsons was accordingly elected by unanimous vote. For treasurer, Samuel J. Hendy of San Francisco was unanimously elected, and for secretary Julian Sonntag was unanimously re-elected.

Tirey L. Ford made a closing argument in favor of the creation of the Department of Mines and Mining, reminding the delegates that active work and co-operation on the part of the miners of this and other States was necessary for success. President Neff then announced the following standing committees:

At Large—W. W. Montague, Edward Coleman, A. Caminetti, W. C. Ralston, W. S. Keyes, George Stone, R. McMurray, John McMurray, James O'Brien, S. B. Christy, L. T. Byington, D. T. Cole, J. J. Crawford, J. F. Halloran, John M. Wright, S. K. Thornton, C. W. Cross.

El Dorado—H. E. Pickett, G. H. Ten Broeck.

Tuolumne—F. M. Willman, A. M. McDonald.

Santa Clara—Charles C. Derby, R. R. Bylmore.

Siskiyou—Andrew G. Myers, John Daggett.

Placer—Charles H. Carr, Harold T. Power.

Yuba—Joseph Durfee, Louis Conrad.

Sierra—F. R. Wehe, Gail Jones.

Trinity—P. M. Paulsen.

Amador—J. F. Parker, E. C. Voorheis.

Nevada—E. J. Rector, J. S. McBride.

Plumas—A. Hall, John Roberts.

Shasta—J. M. Gleaves.

Calaveras—Richard A. Parker, Mark D. Kerr.

San Francisco—Andrew Carrigan.

President Neff also announced the following special standing committees:

Committee on Legislation—Fred Searles, John McMurray, W. S. Soward, Louis Glass, E. C. Voorheis, F. R. Wehe, E. H. Chapman, Charles A. Swisler, W. F. Prisk.

Committee of Revision of Mining Laws—Curtis H. Lindley, W. S. Keyes, J. F. Halloran, John F. Davis, C. V. Gottschalk, T. L. Ford A. H. Ricketts, Stanley A. Smith, R. C. Rust.

Committee on Mineral Exhibit at the Paris Exposition—J. J. Crawford, John Taggert, R. C. Walrath, A. G. Myers, S. B. Christy.

Committee on Secretary of Mines and Mining—Tirey L. Ford, Louis Glass, Charles G. Yale, W. C. Ralston, J. J. Crawford.

Committee on Mineral Lands—A. H. Ricketts, H. T. Power, George C. Sargent, A. H. Ten Broeck, Robert J. Nixon.

Committee on Jetties and Dredging—John M. Wright, J. F. Halloran, W. F. Englebright, John A. McIntire, R. V. Robertson.

Committee on Conference with Anti-Debris Association—John Spaulding, James O'Brien, Thomas Clark.

Committee on Finance—Andrew Carrigan, A. A. Watkins, Louis Sloss, Jr.

Following is President Neff's address:

Fellow Miners:—Another year has passed and another annual gathering brings its pleasures and

duties to those to whom has been entrusted the more active work of our Association. Again we pause in our industrial march to take another annual account of stock and ascertain the progress made by the mining industry of California and the needed measures for its future advancement. Again we meet in general conference for mutual consultation and suggestion, that we may the better aid the great industry upon which our State was founded and upon which its prosperity in great measure yet depends.

We are happily assembled at a time when the mining industry in California has taken on new life and when its future outlook is more than ordinarily bright. The steady increase in the annual gold yield of our State is supplemented by renewed activity and increasing yield in other branches of mining to the extent that the eyes of the world are now turned upon California and legitimate investors are making careful and earnest examination of the advantages here offered.

This happy condition is in no small degree the result of the united efforts of the miners of California through the Association whose representatives are here assembled. The value of organization and unity of action is thus signally emphasized, and the duty of the California miner made clear and plain. I sometimes question whether the miners of this State have always appreciated, or even realized, the substantial benefits that have resulted from their united efforts. Six years ago the mining industry of this State was in a lamentable condition. The annual gold yield was at a low ebb, and one branch of gold mining was practically destroyed. The yield of other minerals was limited, and the belief generally prevailed in the industrial world that mining in California was rapidly becoming a thing of the past. So general was this belief that capital, in its search for mining investments, scarcely gave California a thought, but passed on to more alluring, if more disappointing, fields.

Then came the California Miners' Association with its enthusiastic energy and co-operative determination. Our State Legislature promptly responded to our appeals and Congress lent us a willing ear. Public sentiment suddenly turned in our direction and the people of the valley gave respectful attention to our appeal to reason and justice. Above all, the world once more learned of our marvelous mineral resources and capital hastened to make investment in California mines. To-day the mining industry of California is better known, better understood and is attracting more favorable attention than for a quarter of a century past.

It is not my purpose at this time to review the history of this Association or of the mining industry of California, nor shall I detain you with any detailed statement of the work of the Association for the year just passed. The former I had the honor to present in my annual address a year ago, and the latter will be fully covered by the reports of the various committees.

I am glad to report that cordiality and good feeling exist between those in charge of the State Miners' Association and the executive officers of the Anti-Debris Association of the Sacramento valley, and that there is no difference of opinion regarding these matters, leaving hope for future harmonious action. Several conferences have taken place during the past year between a committee representing this Association and a committee representing the Anti-Debris Association, looking to a joint appeal to Congress for financial aid in the furtherance of such work as the two associations might be able to mutually approve. Although these conferences have so far produced no definite results, yet I am glad to report that cordiality and good feeling existed, and that there is no difference of opinion regarding the necessity of such action, each working in co-operation for the common good and mutual prosperity of our State, in which we are all so deeply interested. To this end we await the action of the Government engineers in adopting and reporting a plan for the protection and improvement of the Sacramento and San Joaquin rivers as contemplated in the act of Congress known as the Caminetti act.

You are doubtless, gentlemen, familiar with the fact that since we last met considerable progress has been made in the important matter of State and Federal appropriation for purposes agreed upon by mountain and valley residents of this State. You are also doubtless fully conversant with the protracted efforts in our State and National Legislatures, and I will but direct your attention to the results.

By an act of March 24th, 1893, the Legislature of this State appropriated $250,000 to be applied to this work, namely, the building of restraining dams. This appropriation, contingent upon a like appropriation by Congress, was made good by a similar appropriation on the part of the Federal Government; and, to obviate any possible legal technicalities, the California Legislature, at its last session, reappropriated the amount. At the same time the State Legislature appropriated $300,000 for dredging the Sacramento river, which makes now available for the purpose on which we all are united $800,000, all of which, except the $300,000 appropriated by the State and under State jurisdiction, is to be expended under the direction of the United States Government engineers for building dams and restraining debris.

There has been considerable delay and some impatience manifested, more especially by valley residents, regarding the beginning of the actual work, and some considerable discussion has been published concerning the proper character of such work. It may be said in passing that when the bill for the $300,000 was signed by Governor Budd it was the direct understanding that the money was not to be immediately available. Without expressing any opinion, one way or the other, upon the State appropriation, it is believed that in a broad view of the matter the State authorities are doing wisely in making haste slowly, and it is to be sincerely hoped that at the coming session of Congress the Federal Government may be induced to aid by further appropriation in this same work, as it is believed that such improvement naturally and rightfully belongs to the Federal Government.

It is understood that the present conference between the State authorities in charge of the dredger scheme and the United States engineers will result satisfactorily. It is likewise understood that the delay in beginning the expenditure of the $500,000 joint State and national appropriation in the construction of debris restraining dams has been occasioned by difficulty in determining the exact point at which the work should begin. In this connection, it is to be noted that there has been considerable of a change in the United States Debris Commission, and it is believed that upon the return of Major Heuer from Cincinnati (which I am informed will be about the first of next month) that progress in this matter will be stimulated.

The $500,000 appropriated for the building of a debris restraining dam is not understood, nor was it so understood at the time, to be for the impounding of fresh debris or for miners to use as a dam for their tailings, but to stop the movement of material mined by miners and stirred up by agricultural development when you and I were boys. It is also clearly understood that under the Caminetti Act, regardless of State or national appropriation, hydraulic miners must continue to build their own dams and take care of their own debris.

I would have been pleased to have given you a more favorable report of the progress made in the expenditure of the $800,000 appropriated, but in the above have briefly outlined the facts as they exist. I would suggest that, in my judgment, it would be well for the Association at this meeting to set forth the present status of the matter and petition Congress for further appropriation to continue the work which the $300,000 was intended to inaugurate.

I also hope that the Mineral Land bill, so long pending in Congress, may be passed at the ensuing session of that body.

I also desire to refer briefly to the International Gold Miners' Convention held at Denver in July last and to the Transmississippi Commercial Congress held at Salt Lake City during the same month. This Association was represented at both conventions, and action was taken by each convention looking to the creation of a Department of Mines and Mining, and also to the revision of our Federal mining laws. At the Denver convention, Col. W. S. Keyes of this Association was made a member of the Committee for Revision of the Federal Mining Laws, and at the Salt Lake convention Hon. Tirey L. Ford was made chairman of the Committee upon Department of Mines and Mining. These gentlemen will doubtless report what action, if any, has been taken by their respective committees.

I cannot conclude without adding a word in commendation of those who have thus far so successfully carried on the work of the Association, and of encouragement to those in whose hands its future usefulness must now be entrusted. The position with which you have so continuously and so generously honored me has afforded me unusual facilities for observing the unselfish labors of those who have so industriously devoted their time and energies to the cause. Whenever legal services have been required, they have been promptly rendered by eminent counsel without pecuniary reward. Whenever anything was to be done requiring executive or business ability, men of affairs have not been wanting to perform the needed service. When money was needed to defray the necessary expenses of important undertakings, that, too, was promptly furnished by the friends of the mining industry. In short, gratuitous service and generous financial aid have marked the course of the Association continuously since its birth. It must be confessed, however, that the mining counties, themselves, have not always responded as they should and that the financial burdens of the Association have fallen quite largely upon the merchants and manufacturers of San Francisco.

To all who have so generously aided the cause I desire to tender the thanks of the Association, coupled with my own personal gratitude, for the kind assistance of those upon whom have fallen the principal burdens of our noble work.

For those who shall succeed to the duties of the present officers of the Association I bespeak the same kind and generous treatment that you have ever accorded to those whom you have so highly honored in the past. Above all, I appeal once more to the miners in the mountains to respond more liberally with financial aid. You are the direct beneficiaries of the great work that has been and is still being carried forward by the Association, and upon you must the future of the Association depend. Without your cordial support the Association must needs confine its work to a more narrow compass, while with your hearty co-operation and financial aid the past achievements will but mark the beginning of a glorious dawn for the industry that means so much to our State and nation and upon which you must rely for your own prosperity and material advancement.

Report of the Legislative Committee.

Following is the report of the Legislative Committee:

To the President, Officers and Members of the California Miners' Association—GENTLEMEN: Your Committee on Legislation beg leave to submit the following report for the year just closed:

1. *National Legislation.*—Nothing has been done by Congress in the matter of mining legislation since the last annual meeting of your honorable body. The Mineral Land bill, so called, which was then pending in the House of Representatives failed to receive the recognition of the Speaker and thus failed to become a law. The same bill was then introduced into the present Congress by Hon. George C. Perkins in the Senate and by Hon. Marion De Vries in the House of Representatives. Your committee regrets, in common with all those who have the interest of the mining industry of this State at heart, that the above bill should have failed of passage by the Fifty-fourth Congress. It is unnecessary to review here the causes of such failure, though it may not be amiss to say that the California Miners' Association did all that lay in their power to secure its passage and approval. Our representatives in Congress give us much hope to believe that the bill will pass and become a law during the approaching session of the Fifty-fifth Congress.

According to an estimate made for your committee by the Commissioner of the General Land Office on June 19th last, there remained unpatented at that date within the railroad land grants in California 11,596,073.86 acres, distributed as follows, to-wit:

	Acres.
Western Pacific (San Jose to Sacramento)	1,128,317.35
Central Pacific (Sacramento to Nevada State Line)	1,199,384.71
California and Oregon (Roseville to Oregon State Line)	922,301 04
S. P. Main Line (San Jose to the Needles)	4,418,296.80
S. P. Branch Line	3,927,873 96
Total	11,596,073.86

Your committee has no means of knowing how much of this vast acreage is mineral in character, though it is believed that a large percentage of it would be found upon examination to be mineral land within the meaning of the proposed Mineral Lands bill.

2. *State Legislation.*—Our State Legislature, during its recent session at Sacramento, so amended the original act appropriating $250,000 for the construction of restraining barriers as to make it conform to the Congressional act and thus remove as near as possible any impediment to the appropriation and expenditure of the above sum. This, together with the $250,000 appropriated by Congress, makes a fund of $500,000 now available for the construction of restraining barriers. It is understood that plans are now being perfected by the Federal engineers for the expenditure of this money and that actual work will be begun during the summer of 1898.

The Legislature also passed an act governing the manner of locating and recording mining claims. This act was intended to supplement the Federal laws upon those subjects and to remedy such defects as experience had pointed out. The bill, as it left the hands of your special committee having it in charge and as originally introduced by Hon. F. D. Soward of Sierra, was amended by the Committee on Mines and Mining in the Assembly in several particulars, which amendments were finally incorporated in the bill by both Senate and Assembly. The principal one of these changes relates to the necessity of doing $50 worth of work upon a mining claim as a part of the location thereof. This change has been the subject of considerable comment, concerning which your committee expresses no opinion. Many other laws were enacted by the Legislature relating to the mining industry which are believed to be of considerable value, but which we have not space to recite in detail in this report. They relate to provisions concerning miners' liens, the safety of miners employed in the mines, the conduct of the business of mining corporations, and many other matters of equal importance to the mining industry. In fact, the Legislature, at its last session, accomplished much in the way of mining legislation and deserves the sincere thanks of the miners of California.

3. *Revision of Federal Mining Laws.*—Pursuant to the recommendation of your committee a special committee for the revision of the Federal mining laws was appointed at the last session of your honor-

able body. Your committee, therefore, has nothing to report in respect to that matter.

4. *Department of Mines and Mining.*—There was also appointed at the last session of your honorable body a special committee to take such steps as they might deem proper to aid in the creation and establishment of a Department of Mines and Mining. This subject, therefore, has not been considered by your committee.

Your committee desire to say, however, that the International Gold Miners' Convention which met at Denver, and the Transmississippi Commercial Congress which met at Salt Lake City, both in July last, took up both of the last above-mentioned subjects and appointed committees to work in their behalf. These committees, so your committee is informed, are taking steps toward securing the co-operation among the miners of the country looking to the establishment of a Department of Mines and Mining, and a scientific revision of our Federal mining laws. As to what steps have been taken in this regard your committee has not been fully advised.

5. *Recommendations.*—Your committee beg leave to recommend: First—That prompt and urgent measures be taken to secure the passage of the so-called Mineral Lands bill at the approaching session of Congress. Second—That Congress be urged to make further appropriations for the construction of restraining barriers and other works, with a view to the improvement and protection of the Sacramento and San Joaquin river systems, to the end that all branches of mining may be successfully and profitably conducted without material injury to other interests. Third—That further steps be taken to secure a revision of the Federal mining laws and the creation of a Department of Mines and Mining.

All of which is respectfully submitted. Harold T. Power, S. B. Christy, Louis Glass, W. F. Prisk, W. E. F. Deal, E. H. Chapman, F. R. Wehe, C. H. Burnham, Committee. TIREY L. FORD, Chairman.

Amendment of Federal Mining Law.

TO THE EDITOR:—In your issue of Oct. 2d I have read with much interest the letter of Mr. F. T. Freeland of Aspen regarding proposed amendments to the national mining code. While fully recognizing the necessity for some changes in the existing laws, and the value of Mr. Freeland's experience to suggest such amendments, I am yet inclined to doubt if he has reached a satisfactory, or the true, solution.

Mr. Freeland summarizes his proposed changes as follows:

1. Location without discovery.

2. Official survey required, and claims limited in size to ten acres in any shape.

3. Substitution of an annual tax of $50 per claim in lieu of assessment work.

4. Vertical boundaries in place of the law of the apex.

To consider these points in the order he has chosen:

(*a*) To allow the location of alleged mineral ground without any discovery therein, or showing of such mineral character, would be a radical change, subversive of the idea which hitherto has been the foundation of our national mineral policy. This has always been to virtually give away the mineral lands as an inducement to their exploration and development, relying on the material advancement of the mineral country to justify such liberality. To permit their acquisition without any work whatever negatives the idea of exploration, and the absence of any showing of mineral character as a pre-requisite to such acquisition can only result in an endless amount of litigation over such character, with all the accompanying "adverses, hearings and experts" which Mr. Freeland deprecates. Coupled with the abolition of annual work, this law would offer an inviting field to the land grabber and speculator, who for a nominal cost could hold vast mineral tracts undeveloped and indefinitely.

(*b*) The extension of the official survey is no doubt a step in the right direction. Already encouraged by the laws of most of the mining States (which permit the filing of such surveys and make them prima facie evidence in the courts, and from the first an ultimate requirement before issuance of patent), they are only objected to on account of the expense incident to getting a surveyor to remote locations, an expense which must be incurred before there has been time to determine if the character of the claim justifies it.

The other half of this clause, limiting claims to ten acres in any shape and without extra-lateral rights, seems very objectionable. It is not proposed to thresh over here the old straw of "square claims vs. law of the apex." Like General Hancock's famous tariff views, this is largely a "local issue." Eminently suited to the sensibly level copper deposits of Michigan, and not objectionable when applied to some of the carbonate deposits of Idaho and Colorado, to parts of Montana and California the square claim is entirely inapplicable. In large systems of parallel fissures, like the Butte deposits, a single square claim of the standard Canadian size would have consolidated numbers of what are now independent and profitable mines. That is to say, a location which would cover sufficient extent of a flat deposit to justify the great expenditure requisite for development would cover too much in a region characterized by close parallel veins with steep dip. A dozen such claims would eat up the heart of the Butte district. On the other hand, Mr. Freeland's proposed claim of "ten acres in any shape" is too small to fit the flatter ore bodies of the California mother lode. To illustrate: This lode may be roughly said to dip easterly at an angle of 45° for the first 200 feet of vertical depth, then steepening to 55° the rest of the way. Similarly, the ore bodies may be said to pitch northerly or southerly along the strike at an angle of about 45°. Assuming the ore chute to pitch southerly, and applying these conditions to the ten-acre claim which has a chute 100 feet long, located at the most favorable point within the surface boundaries, *i. e.*, the northwest corner, in the case cited (and it is doubtful if the locator without discovery would have been fortunate enough to get just this arrangement of surface lines), then the most favorable size for a ten-acre claim becomes 750 feet long by 580 feet wide. At a vertical depth of 650 feet the ore chute would begin to pass out from the surface boundaries through the south end line, and at 750 feet the last vestige of it would go out at the southeast corner. We are just learning that our mother lode shows its best values only with depth, and a law that sets 750 feet as the practical limit of working would prove disastrous. Apply the rule, for instance, to the Kennedy, Gwin or Providence mines.

True, the owner might catch another chute dipping into his ground from outside, or he might be the owner of the next claims on the dip and strike, or he might sell his shaft, when done with it, to the owners of the next claims—and then he might not.

(*c*) The proposed substitution of the annual tax of $50 for the present annual expenditure of $100 is objectionable from many points of view. While it is true that assessment work is often of small advantage to the property, yet in the majority of cases it tends to ultimately develop enough values to insure a sale or development on a proper scale. Most of the larger working mines of 1897 were first brought out by the results of the assessment work. It is certainly a fact that the perfunctory style of assessment work is more generally done by the speculators, and the poor man who has to make every dollar and every day's work count usually does this work faithfully, to demonstrate the value he thinks is in the claim. It is also a fact that it is this same prospector and poor man who discovers and brings out the mines. Mining companies and syndicates rarely prospect for new claims, preferring to wait and buy when the prospector has developed a showing. Every one who has noted the steady call for "developed and producing properties," and the impossibility of getting money for prospecting work, will appreciate this fact, and hence it seems that any change in the manner of acquiring and holding claims should be in the interest of the man who has the brunt of this work to do. Nothing could be further from this or better calculated to crowd him to the wall, and to promote wholesale acquisition of the mineral lands by large corporations, than Mr. Freeland's proposition. With no obligation to discover mineral or to work the claim, the sole qualification would be the ability to pay the annual tax of $50 per claim, which at once places the prospector at a disadvantage as compared with the capitalist. On the basis of ten-acre claims an annual expenditure of $3200 would hold a mile square, even in the heart of any mining district. How many syndicates are there who would not be glad to hold large areas indefinitely on such terms, unexplored and unworked, awaiting developments? For $10,000 or $20,000 Randsburg, Cripple Creek or Mercur could have been smothered with such a law in force. Mr. Freeland says "the tax would prevent the holding of large blocks of claims by one person." Just how a payment of $50 per annum would accomplish in this regard what the requirement of an expenditure of $100 has notably failed to do he neglects to explain.

It, of course, is not strange that such a law should approve itself to the manager of ten companies at once, for it is directly in the interest of corporations; but to the little prospector it would mean annihilation. Many a man who for years has in good faith held and worked his claim never had or expects to have $50 at once; only in the sweat of his brow can he fulfill his obligations to the Government, and the imposition of the $50 tax would mean simply confiscation of his claim. At least, he should have the option of payment or work. Under this provision for annual tax, no discovery and no extra-lateral right, any blackmailer who had squatted a few years ago on the hanging side of one of the big Montana copper producers, and had paid a few $50 taxes, would long ere this have owned property valued at millions, through no merit of his own, only through the enterprise of the Haggins, Hearsts, Dalys and Bigelows. They could pay his price or he could take his property. True, the law would not be retroactive in this case, but history repeats, and there will be more Anacondas and Mountain Views.

Mr. Freeland continues: "Patenting could proceed, on payment of $500 per claim additional," on which he predicates the statement that "hearings, adverses and protests would be much abbreviated and delays lessened."

Patent proceedings are already entirely ex parte, and there are no hearings, adverses or protests at all, save in cases of conflicting surface boundaries. Such conflicts must and will arise at times, and there must be some tribunal and means for settling them. Even in the interest of the most stupendous land grab, it would hardly be maintained that the contestant's rights should be "abbreviated."

The claim that 90 per cent of litigation will be avoided is merely assertion, and probably far from the fact. While so-called "apex" and "continuity of the vein" cases may disappear with the abolition of extra-lateral rights, in their place will spring up a new lot of "mineral character" and "extra-lateral trespass" cases, with attendant applications for entrance to and survey of workings. The claim that mining litigation will be so far diminished as to restore prosperity to the farmers is also a trifle strained. The poor farmer is being overworked these days. We have just been through a long political campaign, where he was alternately held up as an awful example of the opposition policy or promised pie three times a day if he would assist in putting the other fellows in power. He had about come to the conclusion he was ill-used when the prosperity wheat crop shook him up again, and if we now convince him that the real sources of his misfortunes are adverse suits and lateral rights, he may get prejudiced against the whole mining industry—not a desirable result so long as our beneficent system contrives to invariably supply juries fresh from the alfalfa fields to try our mining cases. Let us let the farmer alone; he is doing pretty well, anyway, just now, and in any case he is best off when the laws best foster the true interests of the mining communities.

Mr. Freeland's charge that our mining law is "tainted with geology" is unanswerable, for it is probably true. The same baneful taint has an appreciable influence on all our mining operations. Whether the commission now revising the laws can put forth a code free from geology is yet to be seen.

If they finally evolve a law on the lines proposed by Mr. Freeland, it is to be hoped they will have the candor to entitle it "An act to facilitate the transfer of the mineral lands of the public domain to certain syndicates." R.

River Improvement.

Engineers Nurse and Randle of the Board of Public Works have submitted their report of the work necessary to be done for the improvement of the Sacramento and San Joaquin rivers, Cal.

The report states that, from the Elkhorn up, the river for a distance of about five miles, to the lower end of acceptable levees, numerous crevasses have occurred. These are known locally as the Butcher, Hershey and Jacobs breaks.

In this connection the report says: "The estimated number of cubic yards of earthwork required to repair the breaks and to build the four and one-fourth miles of necessary levee to a height of 3 feet above maximum flood plane with eight-degree crown and three degrees to one degree slopes will be 12,500. This, at 10 cents per cubic yard, will cost $12,550.

"In view of the magnitude of local agricultural interests long devastated by floods, it is to be hoped that the incidental restoration of better conditions resulting from the execution of the proposed plan of river improvement may serve as an incentive to concerted action of land owners and lead to the construction of a greater portion of the necessary levees this fall and winter, in order that no delay may attend the building of an easement as early next spring as the weather and river stage of the water will permit."

The report goes on to say that the site for an easement has not been definitely settled.

The proposed channel rectification of the San Joaquin river consists largely of cut-offs, and the excations necessary will cost about $35,000.

The present intention seems to be to remove the Newton shoals by a system of wing dams.

It Is.

Is it not true that many of San Francisco's manufacturing firms, who never saw a San Francisco daily, are well known to Colorado people through the medium of the MINING AND SCIENTIFIC PRESS?—The Mining and Industrial Reporter, Denver, Colorado, Oct., '97.

THE Pennsylvania Railway Co. broke its record between Louisville and Indianapolis Oct. 5th. The train left Louisville at 2 P. M. and reached Indianapolis at 4:08 P. M., a distance of 106 miles in 101 minutes. Five full stops and two slow-downs were made. The train was a special carrying Louisville commercial bodies.

California Mining Inventions.

To the Editor:—California has long led in improved mining machinery and as one scans the advertising columns of foreign journals, it is not unusual to find familiar cuts of machinery, set forth as "patented" articles of these countries, and all under different names, which the general reader of these foreign publications, unfamiliar with the advance, conceives to be the work of home talent, when of all these "patented" improvements, as applied to mining, it is probably within the limits of truth to say that three-fourths are simply an appropriation of California inventions. Years ago it was well known to our manufacturers, and the complaint may still be made, that no sooner was an improvement put forth in mining machinery, especially in stamp batteries and amalgamating devices, the work of Irving M. Scott, Zeneth Wheeler, Almarin B. Paul, Thos. Varney and many others, than their devices were "drafted" and put forward by others under different "patented" titles. It is time California asserted her due. One of the most glaring appropriations of California inventions is that of the Paul pulverizing barrel, now so generally in use in Europe and Australia. To illustrate this we have taken the trouble to prepare cuts of the original, and also of the foreign "patented" machines, and here give the names of those claiming to be the inventors of same. Almarin B. Paul of California was the inventor of "a pulverizing barrel for reducing ores *to have the material fed continously, and to automatically screen and discharge the same,*" the feature as given in italics, being the vital point of all of these ball pulverizers. The conception was first patented by Mr. Paul, May 10, 1870, and was first put to use by the Ransome Artificial Stone Co. of San Francisco in that year. This machine is illustrated by Fig. 1. This idea

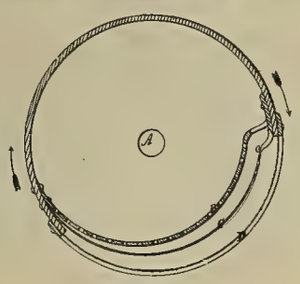

FIG. 1.

was enlarged upon by Paul, who in 1877 obtained a re-issue of his former patent when the barrel as represented by Fig. 2 was brought out. This bar-

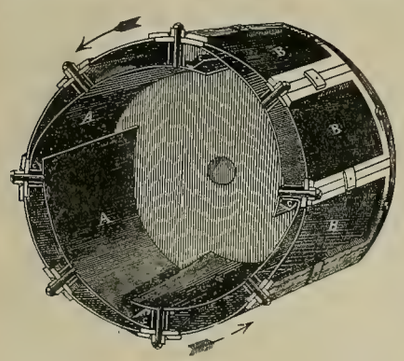

FIG. 2.

rel, though very complete, being ahead of its time, met with but a limited sale, but like every article possessing merit, in after years its value became to

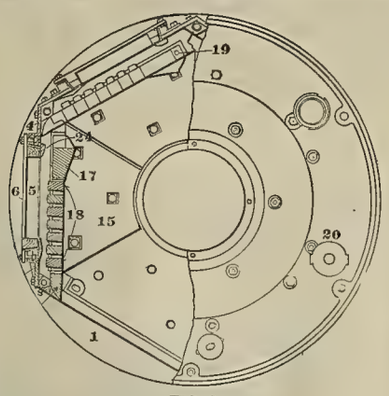

FIG. 3.

be appreciated, and appropriated at the same time. The first one to take the Paul idea of self screening inside and returning the unscreened ore for pulverizing was Miles M. Dodge of this city, who brought out the Dodge pulverizer, which is illustrated by Fig. 3.

This appropriation was amicably adjusted, but soon Paul's patents ran out, he receiving but a limited reward for this valuable invention, as to-day there are over 1000 of these barrels in use.

Now comes the point of this article. This barrel, which was unmistakably a California invention, is now heralded all over the mining world as a valuable one and is "patented" in the several foreign countries in which it is extensively used, notably Germany, England and Australia; the German "patentees" even having the audacity to bring it to the United States, offering it for sale to our miners. To further illustrate our position, a cut of the Grusonwerk ball mill, Fig. 4, patented in Germany

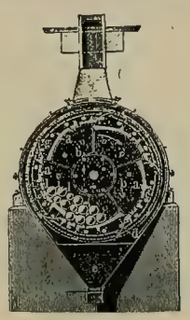

FIG. 4.

FIG. 5.

and now in use in Australia, is given. The mill is also known as the Fried Krupp mill. There are a large number in the Krupp works, and elsewhere in Germany, also in Australia, all going as a German invention.

Now comes the Jenisch "patent" ball mill of Herm Lohmert, Bromberg, Germany, which is heralded as a great and valuable "invention." An investigation of the cut, Fig. 5, shows how much of an invention it is as belonging to Germany.

The next of these machines which we find "patented" is the Otis ore crusher, patented by Hughs, Rigby & Perris of South Melbourne, Australia, Fig. 6. By the foregoing it is seen how our

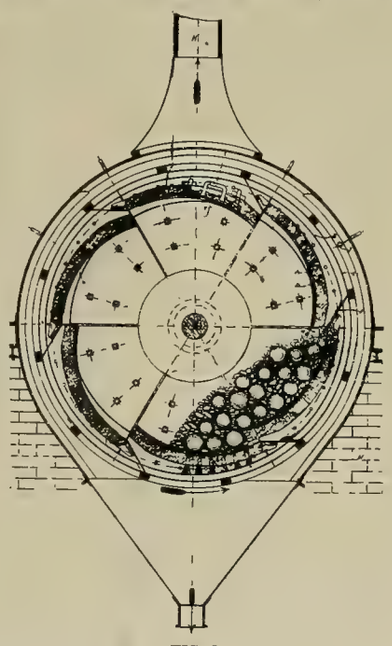

FIG. 6.

California inventions are appropriated by foreigners.

This appropriating of another's inventions, and palming them off as the work of their own brains, is worse than any literary plagiarism and should meet the condemnation of their own countrymen as well as every fair minded man.

So much for Paul's first invention. Seeing the principle, which was conceived some twenty-seven years ago now so generally recognized in Europe and Australia, as he first considered it, he improved upon his original idea, and has succeeded in bringing out a new ball mill on which the Government has allowed him a patent, as the most important step yet made in the line of ball pulverizers.

The main point of this new ball mill is, that it performs the work of automatically returning the unseived material into the center of the barrel for repulverization, and at the same time the crushing is all done with the wearing bars on a complete circle, thus allowing more square feet capacity for pulverizing, and more work to be done at less expense. Besides the mill costs less.

The feed is a central one, which allows the ore to more speedily distribute itself in the barrel during its reduction.

A device as a central circle is so arranged that overloading is at once perceptible, Fig. 7. The screening is all done during the revolution of the

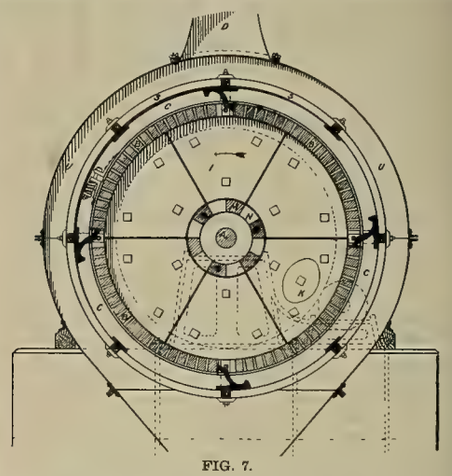

FIG. 7.

barrel, and of any size desired down to an impalpable powder. The barrel will work ores wet or dry equally well.

The merits of this barrel over all others yet put forth stand out so prominent that the Parke & Lacy Company of this city have secured from Mr. Paul the entire control of it, and they will soon commence the manufacture of the same in this city. They have the mill patented in other countries of the mining world.

Mr. Paul, who is one of California's oldest millmen, is strongly of the opinion that the principle on which this barrel is made is in time going to do away entirely with the stamp battery for the reduction of ores. He gives as another reason that as solution systems for securing the highest per cent of gold for the least cost are now coming fast to the front, and as this barrel system of reduction makes comparatively few slimes, which the stamp battery does to a great extent, that it at once becomes the most desirable way of reducing ore, to say nothing of it being done at less cost. Mr. Paul says he knows that it takes time for people to get old ideas out of their heads, but that it will come in time nevertheless.

San Francisco, Oct. 10th, '97.

Agricultural Possibilities of the Yukon Valley.

No doubt many on this coast will be interested in a sketch of the agricultural possibilities of the great Alaskan valley, which is now so prominent in the minds of gold seekers. It is from a Minnesota man, and the California reader will of course remember that his standards of comparison are very different from those a Californian would employ. The following is from a correspondent residing in Fairbault, Minnesota:

The Alaskan Winter.—The winters in the Yukon valley are not much different from those of northern Minnesota in their influence upon the white man. The cold is more prolonged and severe, but the extreme dryness of the air, in a large measure, offsets this difficulty, and a man who has labored outdoors through a northern Minnesota winter will not notice much difference in the cold of the two localities in its effect upon his constitution. On the Yukon there are frequent periods during the winter when a man must desist from all out-door work, and the thermometer drops down to 70° below zero, but I have on several occasions seen the mercury go as low as 60° below zero in Minnesota. From this, it appears that the cold is not to be regarded as so great an obstacle of that region as it has usually been.

Area and Soils.—The Yukon valley is so vast in extent that it is difficult to realize its size, and a very large portion of it is identical with the Red River valley of Minnesota in formation and in soil. The upper terraces of that portion of the Yukon valley which lies below the point where the river makes its exit from the mountains are immense level tracts of deep, rich soil which are only slightly broken at long intervals. So level, indeed, are these flats that the eye can seldom detect any change in the surface on them, and a furrow twenty-five miles long might be turned in many places without a break. The Pacific ocean exerts a profound influence on the climate of the valley, and the changes of the seasons are wonderfully abrupt and decisive. When the spring comes the sudden disappearance of the ice and snow, and the bursting forth of green verdure, are all but

magical. The quick growth of plant life, and the perfection it attains, are truly remarkable. But it seems to be fully accounted for when the conditions of soil and climate that exist in the valley are understood. During the summer the ground never entirely thaws out. The surface is quickly released from the frost to the depth of 4 to 10 feet, according to location and character of the soil, and this frozen state of the subsoil is the principal factor in the growth of plant life. The summer is one long day of three months' duration. The sun swings 'round in a circle and is above the horizon from twenty-one to twenty-four hours each day, so that, for this lengthy period, it never becomes dark, and the ground has no chance to chill; no frost falls, and the thermometer ranges from 90° upwards in the sun during these three months.

Moisture and Crops.—Again, the dryness of the air renders this prolonged, excessive heat as easy for man to withstand as a 75 to 95-degree temperature in Minnesota. It is seldom that rain falls during this short but potent summer, and storms of wind and hail are unknown. But the more prolonged the drought and heat may be the quicker and more perfect is the growth of all plant life present, and the wide valley is clothed in deepest green during these summer months. The secret of this is that an abundant supply of moisture is furnished by the frozen subsoil, that slowly thaws and steadily releases the water stored in it, which is brought to the surface through the channels of capillary evaporation. This moisture is but slightly above the freezing point when it is absorbed by the roots of the growing plants, and it must exert a highly beneficial influence by counteracting the fierce heat that steadily assails the surface of the ground. Under these peculiar conditions of the natural forces of nature it is easily realized that a number of our staple crops will succeed and reach perfection in the Yukon valley. Scotch Fife wheat produces enormous yields of the very highest grade of that grain, which has been proved, by test, to make the best class of patent fancy flour. Barley and oats, potatoes and roots of all sorts, and many of the garden vegetables, also reach surprising perfection. In the case of barley grown in the Yukon valley, the malt makers would likely find the very highest grade of grain for their use, which might soon take precedence throughout the world. The growing barley would not be subject to the vicissitudes it is in the States, and especially it would escape the injury from rains during harvest, and when standing in the shock, which lowers the quality of this grain more than any other.

Present State of Farming.—There are already a number of small farms in the valley which have been opened by disappointed gold seekers, and it is from the results secured on these that I have drawn my most trustworthy information. These farmers are reaping a rich harvest of dollars. The miners stand ready to pay high prices for vegetables, and even for grains, which they grind into coarse meal for bread. This is the golden side of the picture of prospective farm life in that semi-polar region.

The Drawbacks.—But there is a darker side to life in that far northern country, which will likely appear to those used to the comforts of farm homes in the States as insurmountable. The long, cold winter, with its constant night of nearly three months, when the landscape is wrapped in deep gloom, and when only a faint flicker of twilight and the changing play of the aurora borealis shining on the white snow reflect a faint, uncertain light, is likely to give a dubious aspect to the Yukon country. This dismal and dangerous period of the year, coupled with the incredible swarms of mosquitoes and flies in the summer, which make it impossible for horses or cattle to exist, seems to outweigh the favorable features of the valley. Mules and the reindeer will be the beasts of burden in that country if it be ever brought under cultivation. Sheep and hogs will, no doubt, be easily acclimated, and goats may take the place of the cow. The reindeer is a very valuable animal. It makes an excellent beast of burden, furnishes good meat, is easily reared, and is in its native home in that climate, and will take the place of the horse and the ox.

Anticipations.—If, however, a railroad should be built to connect the great Yukon valley with the commercial world, and wheat growing prove to be a profitable business there, the work would likely be done mostly by steam. There is plenty of coal in all districts of the valley, which will furnish cheap fuel for every purpose. On those great flats a traction engine can run a gang plow, turning furrows miles in length, and fields of 50,000 or more acres of wheat would likely be a common sight. The people could live in villages for mutual protection, and in the spring, summer and fall carry forward their farm work on the largest scale. Here the bonanza farm would find its true sphere, with room for all who wished to enter that class of business, and the great Yukon valley could be made to supply the marts of the world with the very highest grade of wheat that would, no doubt, command a better price than that of any other country. Neither are we to presume that this is a painting of the fancy. It will likely become a reality at no distant date.

Gold: The Coming Golden Age.

Extracts from an address by ALMARIN B. PAUL before the California Pioneer Association, Oct. 4, 1897.

* * * * *

How far back in the world's history when gold was first discovered and received the adoration of man is mere conjecture. The most reliable authority points to India, as the oldest of Hindoo records speak of it. That it possesses a remarkable charm for the human family, history of all the ages clearly testify. Not only does it possess a charm, but an influence and a force which at times moves actively the people of the earth, and even nations bow to its silent power.

Its influence for good is widespread and more potent than its influence for evil. We can say that civilization dawned when mining for gold became a pursuit, and history of all the ages shows that the greater the volume of gold and silver produced, the higher intellectually was the standard of the times, as then arts, science and literature flourished.

The dazzling glory of Syria, Greece and Rome was when gold poured lavishly into their treasuries. History of the past, of nations and individuals, respecting the vast treasures of gold possessed by them, is romantic reading. The wealth of men of modern times does not begin to equal the adulation or riches of single individuals of 3000 years ago. * * * * Our purpose at this time, however, is not to deal in the gilded periods of the silent past, but rather to present the more practical and instructive picture of the present; so we will gather the volume of the world's gold at the time when the pioneers of California became fired with the spirit of adventure and launched their "Argo" for the land of gold in search of the golden fleece of the 19th century. As the mind rests, and reviews the historic golden periods of the world prior to the discovery of gold in California, then this of our own golden epoch, as the pioneer knows it, and as it has left the record of pioneer times, we, as actors in this drama, can feel and safely say that it was not only the grandest period of our individual lives, but it was the grandest of any age. It stirred the world to its outermost parts, electrified the human mind, and brought to these then far-off shores, in a single year, 100,000 of the brainiest men of every nation, who built cities and towns, opened highways and byways as by magic, and who, within a period of five years, extracted from the rivers and gulches of California $265,500,000, and by it saved the business world from an impending crushing financial crisis. At the opening of this brilliant period, say, 1st of January, '49, the entire bulk of gold in the world, as near as can be estimated, was $1,800,250,000, and from this date can we say was laid the foundation of the golden age of the 20th century.

The discovery of gold in California and the energetic work of the pioneers in disbursing over the world $550,000,000 in ten years, gave an impetus to explorations in other parts, which has resulted in great discoveries elsewhere, so that the bulk of gold in the world to day reaches close on to $4,500,000,000.

That there is opening a marvelous golden period, and one that should greatly enliven all branches of business, only those who keep up with the advancement and general output of gold all over the world can grasp. That the future may be comprehended as expressed, we will review the world's product of gold for the past twenty years.

Without going into details of the first ten years of this twenty, we will simply say that from 1877 to 1887 the world's total product was $1,055,000,000, and, that the advance of production may be clearly seen, I will now enumerate the yearly product from 1887 to 1897, as follows:

1887	$105,775,000
1888	110,197,000
1889	123,480,000
1890	128,819,000
1891	130,650,000
1892	146,293,000
1893	158,522,000
1894	177,642,000
1895	183,842,000
1896	210,000,000
Total	$1,475,220,000

Thus, you will see that within ten years the yearly yield has doubled, and thus it will be seen, also, that this latter ten years over the previous ten years has an increase of production of $420,220,000, and that the latter five years, over the preceding five, exceeds it by $277,378,000, and this ratio, even, will be exceeded in the coming years.

The year 1897 will produce not less than $240,000,000, and this without considering Klondike. South Africa alone will produce certainly $45,000,000, and, possibly, $50,000,000. Really, I would not be surprised should immigration flow into the Northern gold fields, as all indications lead us to think, but what the yield for '97 will reach $260,000,000. The opening of the 20th century, I am satisfied, will see the world's yearly product of gold reach the enormous sum of $300,000,000. To my mind, this vast accumulation of gold will soon become an exciting, if not an alarming, question for the financial world. There are many reasons for this:

First—The large area of the earth's surface that has of later years been found to be rich in gold.

Second—The great strides made in mechanical devices for cheapening the reduction of ores, and in explosives for extracting them.

Third—The great advance in metallurgical systems, whereby 40 per cent more gold can be saved, at one-third less cost, than twenty-five years ago.

Thus, it will be seen, that gold will soon be as plentiful "as stones in Jerusalem." In Klondike I have an abiding faith, and when I say Klondike, I mean the whole Alaskan and Northwest provinces and reaching on to the Arctic ocean. My reasons are not altogether founded on what gold has been taken from these parts, but on scientific grounds as well, which in as few words as possible I will explain.

The scientific world generally in later years concedes the fact that the metals are a product from solutions precipitated by nature's electrical forces. It is an established scientific fact, also, that there are continuous magnetic earth currents ever flowing from the south to the north pole, and that the electrical earth currents are the opposite, and, through this natural electro-magnetic action, precipitation of the metals, as carried by the thermal waters, from the surrounding rocks takes place. It is also an ascertained fact that the nearer we approach to the north pole the stronger are the electro-magnetic currents; hence, the heavier is likely to be precipitation of the metals.

This is no new idea; it reaches back, to my certain knowledge, for over fifty years; yet it is only in more recent ones that its truth has been fully recognized. So clearly is this principle now understood that in many of our advanced metallurgical establishments the metals are thrown into solutions and by electro-magnetic forces precipitated. It is a plain, simple, practical, every-day operation, but nature operates on a larger scale.

Thus, I am led to say that I would not be surprised at any time to hear of bodies of gold being found in this great northern gold field that will startle the business world. As corroborative of this idea, I will say that previous to the opening of the Lake Superior copper mines, nuggets of native copper of any size were not known. The largest and only piece up to that time was found in the Ural mountains of Russia; it weighed, if my memory is correct, about twenty-five pounds, and was the wonder of the metallurgical world, as much so as a 1000-pound nugget of gold would be to-day. Thus, for countless ages a mass of native copper was unknown and doubted.

Within a year after the opening of the Lake Superior mines, in 1846, at the Cliff mine, on Lake Superior, was unearthed a solid piece of pure copper that weighed 75,000 pounds. This mass I saw myself when uncovered in the mine. Since this time shiploads and carloads by the thousands of native copper have been mined. One may say but this was copper. I will answer: Nature places no more value on gold than copper, yet copper-bearing solutions may be more abundant than gold. Thus, you will see from the foregoing that my expectations are great from the gold fields of the North. I would not be surprised if in time the yield would overreach that of California; yet when we consider that California has produced $1,290,779,000 up to the 1st day of January, 1897, showing a yearly yield of $26,891,041 for forty-eight years, we can see that the great Northwest has some business on hand before she can claim to be the peer of California, notwithstanding her greater area of territory. That we are moving on towards a brilliant period, the figures I have given you clearly illustrate.

There is only one dark cloud on the clear sky of the future, and this is the crushing force of combined capital, nursed by the soulless greed of corporate power. To dispel this cloud wise and just laws must be enacted, that the many, as well as the few, may share in the riches and comforts of God's generous gifts.

The greatness and grandeur of the 20th century, with all the advantages of this coming wealth, and our present knowledge of astronomical, electrical, chemical and mechanical sciences, is beyond our present mental scope to grasp. About fifty-five years ago was published a work entitled "Vestiges of Creation." The writer, through scientific deductions, pictured this then wild, unforbidden Western world, meaning all west of the Rocky mountains, as, in the coming time, the seat of a people greatly advanced in intellectual and physical structure and the home of the noblest men and women of all the ages. The pioneers of this region have laid the foundation, and all things point to a realization of what then seemed but a fanciful dream. The pioneers of California have done their part, and the true history of their time is yet to be written, as the greatness of periods and men only come to the front when the actors are dead. A few of us still live to see the expanse, beauty and value of our planting, but our period will soon be closed. For our descendants and the new generation comes a new age, with new ideas, and issues, broader thoughts, and grander labors, and may they—the blood of the California pioneer—grasp the greatness of their period, and ever prove, in intellectual, moral and physical power, equal for the advance and greatness of the coming golden age of the 20th century.

Scientific Progress.

Calcium Carbide and Acetylene Gas.

The popular idea that calcium carbide is a discovery of very recent times is incorrect. It is a product that has been known for many years, although it did not come into commercial prominence until 1894.

It is a well-conceded fact that Davy had obtained calcium carbide when he noted that a residuum containing aurate of potassium in combination with water generated an evil-smelling gas.

In 1862 Wohler wrote, in the "Annalen der Chemie und Pharmacie":

"The mixture of zinc and calcium in combination with carbon will produce, through the agency of a very high temperature, a carbon calcium. The most remarkable peculiarity of this combination is that when it is brought into contact with water it decomposes into hydrate of lime and acetylene, the same carburetted hydrogen which was discovered by Davy."

In 1893 Travers heated a melted mixture of sodium, calcium chloride and powdered retort graphite for ten minutes in an iron flask, and thereby produced a smelted product containing 16 per cent calcium carbide.

In 1894 Maissan produced calcium carbide by heating in an electrical oven 120 grams of oxide of calcium and 70 grams of sugar coal. The oven was heated to 3500° C. through a current of 350 amperes and 70 volts for from fifteen to twenty minutes. The product weighed 150 grams. This reaction is shown in the following equations:

$$(I)\ CaO+C=Ca+CO.$$
$$(II)\ Ca+C_2=Ca+C_2.$$

Maissan did not look upon his process as being patentable, knowing that calcium carbide, its productions and leading properties were known to chemical literature.

Bullier received in February, 1894, from the German Government, under No. 77,168, a patent for the process of manufacture of "calcium-baryum-strontium-carbid," after the method or process of Maissan. This, when it became known, caused considerable surprise. Later in the same year the experiments of Wilson at Spray, North Carolina, became known.

Calcium carbide is generally produced in ovens similar to those used for aluminum, according to the Heroult system.

Calcium carbide is a hard, bluish-black, clear, crystalline body (exceptional bodies are reddish brown, shiny), and is impervious to light. It is insoluble in all known dissolvent elements; it possesses at 18° C. the specific gravity of 2.22, and its electrical conductibility nearest resembles that of carbon. Dry carbide can be submitted to the action of a powerful gas flame without exhibiting any changes; on the other hand, when heated in an oxygen atmosphere it readily ignites and burns with a strong development of light into calcium carbonate. Hydrogen does not affect it at either a high or low temperature.

When exposed for a short time to damp air it exhibits disintegration, the outer surfaces become crumbly and the color lighter, and a very penetrating odor, strongly resembling that of garlic, is emitted.

When water is poured over calcium carbide a violent generation of gas takes place. The carbide readily divides under the influence of water into acetylene and calcium hydroxide ($CaC_2+2H_2O=C_2H_2+Ca(OH)_2$). It is manufactured in this country at Niagara Falls, N. Y.

The Aluminum-Industrie-Actien-Gesellschaft in Neuhausen, Switzerland, as well as the Electrochemische Werke G. m. b. H., in Bitterfeld, Germany, manufacture calcium carbide which averages in quality 79 per cent. From this percentage 3118 kilograms (6002.9 pounds) of calcium carbide are necessary to produce 1000 kilograms (0.875 cubic meter) of acetylene. It is impossible to ascertain the cost of the production of calcium carbide from either of the above mentioned factories, but taking as a basis the lowest wholesale price of the carbide at 40 marks ($9.52) per 1000 kilograms (2204.6 pounds), then the cost of 1000 kilograms (0.875 cubic meter) of acetylene will be 1247.20 marks ($296.93).

It may be further added that, in addition to the above use of calcium carbide, it can be used advantageously in metal refining, especially for reductive purposes in the manufacture of ingot iron.

The principal feature of acetylene gas is that it burns with great intensity of light. The flame emits a fine soot when burned with an ordinary burner, therefore it should be burned with one specially constructed for this gas, so as to insure complete combustion; then, the flame is blinding white in color and possesses about ten times the intensity of common illuminating gas. When the proper quantity of oxygen necessary for complete combustion is mixed with the acetylene, as shown in the equation $C_2H_2+O_5=2CO_2+H_2O$, a strong explosion takes place when the flame is ignited. The acetylene must, however, be under water pressure, thereby insuring a proper distribution in the pipes as well as a steady flame.

This illuminant has the very great advantage of giving a great amount of light with very little heat; in comparison with the "illuminating" gas, it generates not quite one-half the amount of carbonic anhydride and vapor.

Additional importance is to be given to the fact that acetylene in a liquid state can be used for lighting purposes.

The fact that acetylene is poisonous demands consideration; but this point appears to be frequently exaggerated. As shown by Frank and Weyl, mice and rabbits can remain in a 4 per cent acetylene atmosphere without exhibiting any evil effects.

It may also be remarked that this gas should be handled with considerable care in experiments, as its tendency to severe explosions has been but too sadly demonstrated on both sides of the Atlantic. To this end, caution should be exercised in the following details:

1. Copper should not be used on any part of the pipes, cocks, burners or apparatus, as the contact of acetylene with this metal will shortly be followed by an explosion.

2. The gas should be under sufficient water pressure to insure proper velocity in its distribution through the pipes; if the pressure is weak, the flame is liable to sink through the burner into the pipe. The result of such an accident will be an explosion.

Possibilities of the Commercial Use of Liquid Air.

By Elihu Thomson.

The well-known effect of cooling by liquid air or like gases a conducting metal like copper is almost to abolish its electrical resistance. Consequently a conductor so cooled is able to carry very much larger currents with less loss than at ordinary temperatures. This fact has attracted the notice of electricians and physicists for a long time past. It has recently been found that liquid air is one of the most perfect insulators, and that insulating materials cooled to the temperature of liquid air are greatly improved in insulating qualities. It is known also that cooling renders it more difficult to cause a spark to occur between oppositely electrified conductors, the striking distance for a given pressure being diminished. The stability or permanence of liquid air in bulk, even when it is fully open to the ordinary atmosphere or kept at atmospheric pressure, is, of course, simply dependent upon the heat insulation provided, and if this could be made perfect, the air would never evaporate. Recent methods, such as those of Linde, make it possible to obtain large quantities of liquid air by simple means and with moderate expenditure of power. Cataract power is twenty-four-hour power, and as there are but few industries demanding power for the whole day, it must follow that in the case of many large plants surplus power is either not used or wasted, and that to keep the plant working night and day at full capacity is desirable, even if some of the power only yields a moderate return. Can it not be used in making liquid air? Cannot the excess at certain times of day be put to use in compressing air to be afterward liquefied on the large scale? It would seem that large tanks of liquid air can be heat-insulated very perfectly by layers of air and fibrous material properly placed outside. The evaporated air from the tank could traverse the jacketings in successive order from within outward, and help to keep down the temperature of the jacketings. A furnace with an internal temperature of 2000° to 3000° above the normal temperature is easily insulated by moderate thicknesses of asbestos or other fibrous coating, so that the outside temperature is but slightly above the normal. The temperature difference between liquid air and normal air is, say, one-eighth of that between the interior of the furnace assumed and the normal, so that it ought to be possible to insulate so that but little heat would enter. In most electric long-distance transmission lines a loss on the line of about 10 to 15 per cent is suffered. If the conductors were immersed in a pipe with liquid air, the loss might fall to not over 1 to 2 per cent, perhaps, leaving available a large power for condensing air to supply evaporation. It may be possible that a much higher voltage than is now used may be successfully used with conductors cooled and insulated by liquid air. If the potential could be raised, either the loss on the conductors for a given power transmitted would fall off as the inverse square of the voltage, or the conductors could be made smaller in the same proportion, or the distance of transmission increased with the same section of conductors as the square of the potential. These are matters worthy of experimental determination. The limit to the capacity of an electric transformer to transfer energy from its primary to its secondary circuit is found in the heating and loss involved in the copper conductors comprising these circuits, and upon the nearness with which the two circuits may be placed one to the other, which is in turn governed by the insulating material used to separate them. Could the conductors be kept cool by liquid air, and thereby their conductivity and insulation greatly increased, the work of transfer in a transformer could be much greater for a given size than it now is, although 3 per cent is sacrificed in ordinary practice. Transformers in liquid air might be made entirely of copper without iron. A transformer without iron would moreover avoid the loss in the iron and would permit a saving in material.

A new solvent for chloride of silver is found in accordance with the fact that much in the same way that most insoluble silver compounds dissolve in ammonia, so do they dissolve in the very similar volatile alkali methylamine—methylamine being ammonia in which one atom of hydrogen is replaced by the radicle methyl. Thus, ammonia is NHHH, and methylamine is NHH (CH_3). R. Jarry finds that when the solution of silver chloride is evaporated, bi-refractive crystals are deposited which consist of one molecule of silver chloride united with one molecule of methylamine. Gaseous methylamine unites with dry silver chloride to form the same compound.

The following are the compositions of some of the most prized of the Japanese copper alloys: One hundred parts of copper with from one to ten parts of gold constitute the varieties of skadko, which is colored bluish-black with copper sulphate, alum and copper oxide. The gray quishibuishi contains, besides copper, some 30 to 50 per cent of silver. Sinchu, the best Japanese brass, consists of 100 parts copper, 50 parts zinc. And, lastly, a bell-metal is made up of 100 parts copper, 15 parts zinc, 40 parts tin and 5 parts of iron.

Mechanical Progress.

Uses for Gilsonite.

The discovery that gilsonite, the new asphaltum which has been found on Indian lands in Utah, and will protect a ship's bottom from seaweed and corrosion, is likely to end the attempts of speculators to induce the Government to open these lands to entry. If the Government owns the only gilsonite deposit known, it will hardly consent to make it an article of commerce available for use to foreign navies. A monopoly will enable our war vessels to keep the sea indefinitely, while foreign ships are obliged to seek port at short intervals to be scraped and cleaned. It would be worth millions of dollars to this country in a war to always have the best speed of its cruisers available. At present a cruiser long in service, that made twenty knots on her trial trip, only makes fourteen or fifteen because of her foul bottom; but, with the hull painted with gilsonite, twenty knots could be run, if the stories about the new asphaltum are true, by a vessel which has not been docked in years, always providing that no accident should intervene. The probability that piles could be protected from the teredo by this new substance is not great, but it would bear looking into. At present, however, the chief advantage of its use is naval, and this is enough to warrant the Government in guarding it with jealous care. Inventions may be copied, naval plans stolen and engines and ships duplicated; but, if we have all the gilsonite there is, and that on Government land, we can keep it for our own use, no matter what the anxiety of foreign naval officers may be to get some of it for theirs.

Of Interest to Boiler Makers.

That galvanized sheets which are made of steel with the oxide formed in rolling removed, and then coated with spelter, are not more generally used in boiler or tank works is because the advantages thereof are not sufficiently understood. The extreme cheapness of steel plate and improvement in manipulating same has been followed by the general substitution of steel plate stacks and chimneys for brick. It is, however, well for boiler makers to remember that the action of moisture, especially when impregnated with sulphur arising from soft coal, has a destructive influence on steel plates, rusting rapidly, particularly in the lighter gauges. This may be delayed by frequent painting or varnishing. The coating of spelter or steel sheet is impervious to moisture, and therefore the life of the metal is preserved indefinitely, especially where it may be painted with ordinary commercial stack or boiler paints. Boiler makers should remember that unless they call the attention of their customers to this fact, they will find a large and profitable part of their business leaving them on account of the short life of the ordinary steel stack as now made, because the first cost of the brick chimneys will be of less importance than the inconvenience and cost of having to replace a steel stack or chimney.

A method of preserving boilers not in general use has been prescribed for the French navy. The boilers are completely filled with fresh water; in the case of large boilers with large tubes there is added to the water milk of lime; in the case of tubular boilers with small tubes soda is added, the solution, however, not being so strong as for the larger tubes, in order to avoid any danger of contracting the effective area by deposit from the solution. The strength of the solution is to be just sufficient to neutralize any acidity of the water. Care is enjoined to be taken to preserve the outside of the steel or iron tubes in those boilers which are not to be used for long periods; such are for this purpose painted with red lead or coal tar as far as is possible to reach, while for those portions which are inaccessible a protect-

ive coating is obtained by burning under the tubes a certain amount of tar or coal tar, the smoke of these forming a coating of soot, which prevents the air from reaching the surface of the tubes. Besides this treatment, the boiler casing is closed and kept airtight, after some quicklime has been placed inside. Periodical inspections of these boilers are made to insure the complete filling of the tubes.

In a paper recently read before the Institute of Mining Engineers by D. H. Bacon some interesting comparisons are drawn in regard to past and present production of iron ores in the Lake Superior district. Up to 1870 a 700-ton ship was an enormous craft as an iron ore carrier in that district, the loading of which required at least two days. In 1871 the largest ore barge carried 1050 tons, and made twelve trips per season. Now the cargoes reach 5000 tons, the loading requiring less than three hours and the unloading ten hours. The annual shipments have grown from a few thousand to 10,000,000 tons, and the ability of the mines to produce is not taxed. Great savings have been made in each detail of each department. As illustrating the cheapening that has been effected, ore is to-day sold at Lake Erie ports for $1 per ton less than in early times it actually cost to mine it, and this is done without loss, and further economies may be expected. Nitro-glycerine and power-drills have done more to reduce cost than any other two improvements. In 1871 a drift at the Cleveland mine cost $100 per foot. Now the cost would not exceed $16. As viewed from the present experience the early methods of mining were very crude. Horses furnished the power and they were worked in all possible places. The little machinery then in use was poor and often but ill-adapted to the work. Now single, compound, triple and condensing engines of large power are found throughout the iron ranges for hoisting, pumping and compressing. The striking hammer has been supplanted by the power drill, and electric motors and rope-haulage are common above and below ground. Underhand, back and breast stoping, square sets, caving sets, saddle-backs, and milling and filling are common. Steam shovels and locomotives have taken the place of hand shovels and carts.

Electrical Progress.

The Sacramento Meeting.

A meeting of the Pacific Coast Electric Transmission Association was held in Sacramento, Cal., last Wednesday, the 20th inst., and was well attended by members of the organization. Those present were C. P. Gilbert, president, manager of the Sacramento Electric, Gas and Railway Company; Robert McF Doble, secretary, manager of the Blue Lakes Water Company; L. M. Hancock, chief electrician of the Nevada County Electric Power Company; Dr. C. Van Norden, general manager of the Central California Electric Company; E. W. Sutcliffe, superintendent Central California Electric Company; R. W. Van Norden, assistant superintendent Central California Power Company; C. W. Hutton, chief electrician Sacramento Electric, Gas and Railway Company; August J. Bowie, Jr., assistant electrician Sacramento Electric, Gas and Railway Company; F. T. Vanatta, chief electrician Yuba Power Company; E. J. DeSabla, Jr., manager Nevada County Electric Company; John Martin, manager Yuba Power Company; T. A. W. Shock, Sacramento Electric, Gas and Railway Company; M. L. Osler, San Francisco; S. Morgan Smith, Yorke, Pa.; C. N. Beal, manager Power Development Company, Bakersfield; Theo. O. Theberath; T. S. Lee, San Francisco, and M. W. Stewart, electrical engineer.

The meeting was called to order by President Gilbert, who introduced Mayor Hubbard, who said Sacramento has a great deal of electricity, which is being largely utilized for all purposes, though as yet the people know very little about it, and he hoped that the present meeting of electricians would throw light upon a dark subject.

The membership of the Pacific Coast Electric Transmission Association is composed from the following companies: Blue Lake Water Company, Amador county; Big Creek Power Company, Santa Cruz; Southern California Power Company, Redlands; Central California Electric Company and Sacramento Electric, Gas and Railway Company, Sacramento; San Joaquin Electric Company, Fresno; Power Development Company, Bakersfield; Portland General Electric Company, Portland, Or.; Nevada County Electric Power Company, Nevada City; and San Gabriel Electric Company, Los Angeles.

President Gilbert stated that the meeting would be informal, and would be devoted entirely to the reading of technical and scientific papers on hydraulics and electricity and discussions of the same.

S. N. Smith read an interesting paper on hydraulics, and the discussion which followed covered a wide range. This was followed by an able paper on "Governors," written by S. N. Knight of Sutter Creek. Mr. Knight was not present, but his paper was the cause for a lengthy discussion, during which water governors of all descriptions came up for criticism, the consensus of opinion being that hand governors give best satisfaction.

Papers on "Insulation," from Henry B. Sears and C. S. Newell of Boston, were next read, and these were followed by John Martin of the Yuba Company, who gave exhaustive and practical reasons why glass insulators were preferable to those made of porcelain.

Superintendent Sutcliffe's paper on "Protection Against Lightning," was listened to with great interest, and several other essays on similar subjects occupied the attention of the meeting until a late hour.

The Southern California Power Company of Redlands this week filed a contract on the part of the company with Thornton & Leonhardt of Los Angeles, to construct a power house on the north bank of the Santa Ana river. Another contract entered into with the firm of Fairchild & Gilmore of Los Angeles is for tunnelling, etc., involving the expenditure of $100,000. The power house agrees to pay 20 cents per cubic yard for earth excavations, 50 cents for pan excavations, 50 cents for loose rock, and $1 for solid rock. The amount to be paid for masonry and the concrete work is also specified in detail. The building will be of concrete and granite boulder masonry, and the foundations and water-ways will be concrete. There will be foundations for sixgenerators of 1000 H. P. each and three smaller generators, all with their water-wheels. The structure will cost $20,000.

In the course of experiments, M. Hemptinne has discovered that a Crookes' tube in proximity to a high-potential electric discharge facilitates the action of the latter at a greater gaseous pressure than the normal. For instance, with the apparatus used, the pressure of hydrogen had to be reduced to 71 mm. before luminescence ensued throughout the extent of the gas. When, however, a Crookes' tube at short distance was put in action the same phenomena were produced at 94 mm. pressure. An aluminum screen was interposed to cut off all but x-rays. Tests with various organic and other elastic fluids were undertaken; and, although no constant could be deduced from the results, it appears that the higher the molecular weight of the gas the greater is the proportional effect of the Roentgen ray.

An unusually large multiplate static machine has been completed by a New York firm to the order of a medical practitioner. It is of the Holtz type, having eight ⅜-inch plate glass plates 5 feet in diameter, mounted upon a 4-inch steel shaft, supported on roller bearings. A Tœpler-Holtz machine, fitted in one corner of the glass case containing the apparatus, serves as a separate or initial exciter. The plates weigh nearly 1,000 pounds, and are intended to revolve at a speed of 250 revolutions per minute, it being anticipated that under favorable conditions a 30-inch spark can be obtained. The machine is enclosed in an oak and glass case 11 feet wide, 5 feet deep and 9 feet high, rendered practically airtight by rubber gaskets.

Deeds of assignment were filed in Marysville last Wednesday conveying from F. W. Page to John Martin, representing himself, E. J. Desabla, Jr., of Nevada county, and R. R. Colgate, of New York, the lease of waters in transit from the Brown's valley irrigation canal, and fifty years' assignment of franchises heretofore granted F. W. Page or assigns by the city of Marysville and the county of Yuba. They purpose erecting and maintaining an electric power plant. They have contracted with the Brown's valley mines to supply all necessary power, commencing April 1st next. Power will be supplied by the Sperry Flour Company of Marysville.

Electricity will henceforth be used as power for operating the W. Y. O. D. mill in place of steam, arrangements having been completed with the Electric Power Company for this purpose. Temporarily one of the Gold Hill Company's motors will be used. The W. Y. O. D. is showing great improvement and the twenty stamps will be kept running all the time.—Union, Grass Valley, Cal., Oct. 20.

Commercial Paragraphs.

The J. H. Montgomery Machinery Company of Denver, Colo., report the shipment of two cars of mining machinery to the Kassar Gold Mining and Milling Company, of Globe, Arizona, this week.

The Colorado Iron Works Company, of Denver, Colo., report the following shipments: One carload machinery to Boston Battle Mountain Manufacturing Company, Victor, Colo.; one carload machinery to Metallic Extraction Company, Cyanide, Colo.; 5-stamp mill, with crusher, etc., to Westchester Manufacturing Company, Breckenridge, Colo.

The pipe for the LaGrange Company, at Stewart's Fork, of which William H. Radford is superintendent, was manufactured for Schaw, Ingram & Batcher, of Sacramento, Cal., at Springfield, Illinois, of boiler steel and of various thickness up to ⅝ of an inch, the pipe being 30 inches in diameter. It weighed 586,000 pounds; railroad freight charges were $5500 to Redding, whence it was shipped on wagons to its destination by contract to F. N. Woods for $6400. The pipe shipped to the French company at Junction City, E. Saladin, manager, was made by Schaw, Ingram & Batcher in Sacramento, and was thinner than that for the LaGrange Company, but about the same diameter. This pipe weighed 450,000 pounds; railroad freight charges were $1600. The freight charges from Redding to Junction City were $5050.

The largest hoisting engine in the State of Montana will in a short time be in operation at the St. Lawrence No. 1 shaft of the Anaconda Company. The engine, which is being installed at the present time, was built by the Union Iron Works of San Francisco, its cylinder dimensions being 30x72. It will have a capacity of handling two four-deck cages to a depth of 5000 feet or over. The new engine room is of brick on a solid stone foundation and stands south of the old shaft house. To supply steam to the big engines five mammoth upright Berry safety boilers were recently installed in a building about 200 feet east of the engine room. The plant is a model one in every respect, no expense being spared in its equipment. The first steel gallows frame in the State will be in use at this mine. The frame is now in place and only the finishing touches are needed to the big engine to have the new plant in operation. The gallows frame is 113 feet from base to top, but its base being 18 feet below the collar of the shaft makes it 95 feet in the clear from top to mouth of shaft.

A notable addition to the already extensive electrical plant of the Niagara Falls Hydraulic Power and Manufacturing Company in the power house at the foot of the cliff, at Niagara Falls, New York, will shortly be made in the form of a General Electric Company electrolytic generator, which will be the largest of its kind ever constructed. It will be both liberally and carefully designed to enable it to cope with the very severe service of electrolytic work, i. e., for practically continuous operation. This machine will have fourteen poles and will run at 257 revolutions, giving an output of 5000 amperes at 175 volts, or a capacity of 875 Kilowatts. It will be of the largest type and will be directly connected to the water wheel shaft. It will be provided with a special panel switchboard with full form K equipment of instruments necessary to handle a current of 5000 amperes. The General Electric Company is already well represented in the power house of the Niagara Falls Hydraulic and Manufacturing Company. Two of its six-pole, 560 K. W., 300 revolution, 650 volt railway machines, both directly coupled to the same turbine shaft supply current to the Great Gorge Railway. In addition the station contains a General Electric booster and two other generators, one of 100 and one of 90 K. W.

Coast Industrial Notes.

—The San Francisco Chamber of Commerce last Wednesday adopted resolutions to be forwarded to the California Representatives, calling for the establishment of a Department of Commerce and Industry in the executive branch of the Government.

—At Eureka, Cal., the Dolbeer and Carson Lumber Company will on November 1 pay its eighty men an increase of 25 per cent. The Elk River Mill and Lumber Company, owing to an advance in the price of redwood of $2 per thousand, caused by increased shipments to Australia, will resume operations next Monday with a full complement of employes, after being closed down for fifteen months.

—Henry R. Woods of Scotland is in Victoria in connection with the proposal of an English shipping syndicate to enter into the carrying trade between there and the Yukon next spring. He estimates that 100,000 people will leave England for the Klondike, and his company wants a share of this trade. He proposes to put on four 1000-ton steamers, to load at London and bring out about 3000 passengers each. He will probably reconsider his idea after getting some information as to the facts.

—Beginning on the 31st inst. a new steamship service will be started from Portland, Or., to Yokohama and Shanghai and Hong Kong, China. It will be run in connection with the Oregon Railway and Navigation Company. Three steamers will constitute the service, the Braemer, the Mogulam and the Pelican. They will leave Portland in the order named, approximately every three weeks, beginning with the last day of the month. The new Transpacific service will be known as the Northern Pacific Steamship Company, Portland line.

—The steamship Alameda from Australia yesterday brought 400,000 English sovereigns, about equal to $2,000,000, consigned to the Anglo-Californian and the London, Paris and American banks of San Francisco, the third shipment of gold from the same source on as many consecutive steamships, aggregating nearly $8,000,000 within the last three months. The Mariposa came in August with 450,000 sovereigns; the Moana brought 740,000 sovereigns, and $310,000 in gold bars from New Zealand. Adding the $2,000,000 on the Alameda brings the total up to $8,000,000 for the fall season thus far, a pretty good Klondike for California.

—Edward Strasburg, manager of the American Crude Oil Company, has been appointed secretary and general superintendent of the Los Angeles oil producers' trustees. The *Times* says Mr. Strasburg took an active part in the executive control of the old Los Angeles Oil Exchange in the days of 30-cent oil. At that time a plan of exporting oil to San Francisco was successfully carried into effect, and after several weeks of hard work the price of crude oil was advanced, step by step, until dollar oil dominated the local market. If necessary the San Francisco market will again be resorted to for relief. Owing to better shipping facilities and a market having already been established in that city, oil may be shipped there with far more profit to exporters than formerly. Shipments now being made net the Los Angeles producer nearly 80 cents per barrel.

—The Manufacturers' and Importers' League of San Francisco proposes to bring dealers generally from the country and secure trade mutually advantageous to buyer and seller. Each member contributes $50 to a general fund for buying return tickets to country dealers who take advantage of the proffer. This week applications for 12,000 free return tickets have been received from local mercantile establishments. The time for dealers to visit San Francisco has been extended to embrace the period between October 23d and November 25th, and they may remain until November 30th. The travel is at present limited from and to stations located on the Southern Pacific Company's roads—El Paso and western stations, Ogden and western stations and Portland and southern stations—the Valley road and the Pacific Coast Steamship Company's lines. The conditions under which return tickets will be granted are all stated on the buyer's ticket. One sentence is as follows: "Tickets not good for free return trip by the Manufacturers' and Importers' League on steamer between Portland and San Francisco."

—The three big passenger locomotives placed in service in New Mexico by the Southern Pacific Railway Company have a remarkable capacity for high speed. One of them could pull at the rate of sixty miles an hour on a piece of level, straight track no less than thirty-three Pullman cars weighing forty tons each. Such a train would be more than two-fifths of a mile long. The six coupled driving wheels of these engines are each 6 feet in diameter, and the working steam pressure is 200 pounds to the square inch. The cylinders are of the ordinary simple type, each 21 inches in diameter, with piston stroke of 28 inches. This gives a tractive force, or drawbar pull, of 27,400 pounds, sufficient to haul a train load of 4279 tons, equal to about eighty-five of the largest loaded freight cars, at slow speed on a level track. The total weight of one of these locomotives is seventy-five tons, of which fifty-eight tons rest on the six driving wheels, the remaining seventeen tons being carried by the four-wheel truck in front. Reckoning the bite or grip on the rail at one-fourth the weight of the drivers, there is adhesion of fourteen and one-half tons, or 29,000 pounds more than the tractive force of the engine, thus leaving a margin for wet weather and slippery rails.

Mining Summary.

CALIFORNIA.

Amador.

Rich rock is reported struck in the Iron Mass mine, near Volcano, in a crosscut from the shaft at a depth of between 200 and 300 feet. A chute of ore was encountered from 1 to 2 feet in width.

Ledger: The shaft at the Esperanza is down 700 feet. The shaft has been enlarged, a second reel is being added, when completed the shaft will be driven 300 feet deeper.

A San Francisco company intends to reopen the old Centennial mine at Dry Creek east of the Cosmopolitan. T. B. Dillon will superintend operations.

The mill at the Red Hill mine was started up Thursday morning for a steady run. C. B. Zeek, superintendent.

At the Bellwether, Superintendent Knapp informs the *Dispatch*, the water has all been taken out and sinking will be resumed.

At the Zeila workmen are driving a drift at the 1000-level.

The Amador Queen No. 2 and mill, and Dewitt mines have been bonded to an Ohio company for $85,000—the first payment of $6-300 was made in Jackson last week. The properties will be developed.

In the case of the Argonaut vs. the Kennedy Mining Company, the latter company had the cause transferred to the United States Court, but the Argonaut Company's attorneys deny the jurisdiction of the Federal Court and have asked for a retransfer to this county. Lindley, Eickoff and McGee represent the Argonaut and J. M. Wright, the Kennedy. The suit is for $400,000 damages and ground considered to be worth a million.

Record: The Giualinni mine is six miles east of Sutter creek, and is owned by Nixon & Giualinni. There is a tunnel on the ledge of 106 feet. The rock shows free gold. Several assays run $37.

Butte.

(Special Correspondence). — Development work is being quite extensively carried on in and about Forbestown. At the Denver they have four tunnels. The lowest is 600 feet on the ledge, which is from 4½ to 10 feet and averages $5. The sulphurets average 3 per cent and their value is from $75 to $250 per ton. The footwall is slate, and the hanging is grano-diorite. The ore is mined and milled for $1.50 per ton. There is a 10-stamp mill and four concentrators in good order used for prospect work. H. H. Noble of San Francisco is the owner, and F. L. Noble is superintendent.

The Carlise mine has a 28-foot ledge of low grade ore in a slate formation. The sulphurets are profuse. The company has just completed a 10-stamp mill.

Burroughs & Son are operating quite extensively in the development of mining property. They have bonded one mine to San Francisco parties on which there are three tunnels 90, 50 and 30 feet, all on the ledge, which is from 3 to 5 feet and assays from $12 to $20 per ton, including the sulphurets. The same parties own the Golden State, which has a tunnel 100 feet and a crosscut tunnel of the same length on a ledge 20 feet wide. The formation is known in local parlance as greenstone and porphyry.

The same parties are working on the Ira, one mile west of town. The tunnels are 250, 130 and 200 feet. They can get 1000 feet of "backs." The ore will run from $10 to $20. The tunnels follow the ledge. Ore from this mine will be taken to the mill on the Bullion this week.

Burroughs & Son have another large low grade proposition, the ledge of which is 20 feet wide. There is some development work done.

The Gold Bank or Stowe mine, a quarter of a mile from town, runs 40 stamps and two concentrators to each battery. When leaving the concentrators the slimes are dropped to a canvas plant 60 feet long, divided into 25 sluices 18 inches wide. When leaving this they are caught on another canvas plant of the same dimensions. I am informed that these canvas plants yield $1000 per month.

The Oregon Gold Mining Company, Josiah Champion superintendent, has two crosscut tunnels and two drifts from each crosscut, and an upraise from the lower to the upper tunnel. The drifts are all on the ledge, which is from 9 to 20 feet. There is a 2-stamp prospect mill in operation.

Forbestown, Oct. 15th, '97.

The dredger now being built for mining in South Thermalito is expected to handle large quantities of dirt and gravel. It is estimated that 2000 cubic yards of earth can be handled in twenty-four hours, and that this will pay thirty-three cents to the cubic yard. If it pays one-fourth of that it will do well.

Register: The stamps used in the Banner mill which is now being erected will weigh 1050 pounds. They will be run by compressed air.

At the Little Hope mine eight men are now employed by Supt. Lambert. Preparations are under way for a 5-stamp mill to be erected this fall.

Calaveras.

The Oriole M. & M. Co. of Stockton, has a strike in the Big Bonanza mine. The mine is 300 feet from the Utica mine and has been worked years ago, when over $30,000 was taken out on the surface. A shaft was sunk recently and about $8000 taken out.

The California Lion Quartz mining claim in Railroad Flat district, is bonded to A. A. Dudley of Stockton for $1000.

El Dorado.

At the Saucerman, at Greenwood, the new mill is on the ground ready to be set up.

Democrat: At a depth of 700 feet the Boulder mine, in White Oak township, has developed a paying ledge 12 feet wide. The only drawback is the want of water for milling purposes.

Present owners of the Gray mine, on the east side of Gray's Flat, began operations this week.

Fresno.

A Pine Ridge report says: More mining and prospecting has been done in the mountains this summer than ever before.

Two thousand feet of pipe has been freighted into the Yellow Bottom placer mine, owned by W. Bennett & Co., San Francisco. They have men building a ditch to carry water for the 10-inch monitor.

A body of rich ore is reported uncovered in the Richmond.

Darby & Moore have built a water power arrastra at the Hancock mine.

Ritchie, Halbert & Company are developing the Chispa. They also have the Rolland mine bonded.

Kern.

In the hills to the southwest of the town of Randsburg nature has shown strange freaks in the deposit of gold. Veins of quartz run in every direction, appearing above the ground, disappearing far beneath, running straight for a few feet, then diverging with as many angles as a streak of lightning. These stringers perpiex all calculation. The tiny veins of quartz are rich in gold, and at first were supposed to descend only a few feet, and to be streams, as it were, cast off in the general upheaval, and scattered on the surface of the soil. When they were followed deeper, however, they were found to unite and form feeders to rich bodies of ore, and "the stringer district" bids fair to become the richest portion of the gold fields. From a consecutive run of 20 tons, 380 sacks of ore, $3,800 was realized by one of these stringer mines in the month of June. Another averaged $80 and a third $130 a ton for the same period, and the total average of all the stringer mines for the same time would be about $90 to the ton. The coyoting of a single mine in the Rand for six months produced $80,000, and in nine months the same amount was taken from the shaft on a triangular claim 300 feet on a side, the only machinery in use being an ordinary whim.

At Randsburg, the Meteor mine has been bonded for $25,000 by Carpenter, Price and Kelly, to McGrew & Ellis. Price and Kelly have bought the Combination, an extension of the Meteor, for $2000 cash. The Little Butte Company has established a level at a depth of 385 feet, and is now drifting both ways in a vein of good ore. The 25-horse power gasoline hoisting engine will be in position next week.

Wilshire and Blaisdell of Los Angeles have a working bond on the Pioneer, Garfield and St. Michael claims for $15,000.

Nevada.

The Spence Mineral Company has incorporated to work a copper mine at Spenceville, capital stock $100,000, subscribed $20.

This week the United States Circuit Court of Appeals affirmed the decision in favor of the North Star Mining Company of Grass Valley in the suit brought against it by the Carson City Gold and Silver Mining Company. The case was a suit for damages in tresspass. The plaintiff, as owner of the Irish-American claim, complained that the defendant, whose claim was adjacent to the Irish-American, had followed and worked its lode in its descent under the Irish-American property. The court decided that the defendant "has a right to pursue and follow its North Star ledge on its downward course to any depth underneath the surface of said Irish-American mine."

The United States Circuit Court of Appeals this week decided the case of the Carson City G. & S. M. Co. plaintiff in error, against the North Star M. Co., defendants in error, involving the question of whether an owner of mining property, formed by the consolidation of several mining locations, had the right to follow the ledge of vein under the surface of another mining property, when none of the owners of such locations that were consolidated would have had such right. While not deciding this abstract question, the appellate court affirmed the decision of the trial court, which specifically gave the North Star the right to follow the ledge outcropping on its property, under the surface of the mining property of the C. C. G. & S M. Co.

Transcript: L. S. Rose, secretary of the La Suerte Mining Company, with other San Franciscans and W. W. Kirkham of Nevada City, have bonded the Lyons & Eddy and J. C. Locklin's Mountain Chief quartz mines in Willow Valley. The new company will immediately begin working these properties on an extensive scale. The 500-foot drain tunnel in the Lyons & Eddy will be driven another 500 feet into the Mountain Chief, and a first-class hoisting and pumping plant will be erected. Mr. Kirkham will have charge of the operations. These properties adjoin the Texas and Murchie, and the ledges of both the latter run into them. The Lyons & Eddy and the Mountain Chief have been worked to a depth of about 100 feet, and have produced $200,000.

Union: That the mining situation in Grass Valley is on the improve is evidenced by the increased pay roll of the past month over that of the preceding months of this year. It is estimated by a gentleman who has looked closely into the matter that last month the pay roll of the Grass Valley mines was something over $50,000, and that over 600 men were employed on day's pay. This represents an increase of about $3000 over the preceding month and a proportionate increase in the number of men employed. During the past few months the North Star, Empire and Allison Ranch mines have given employment to an increased number of men.

Placer.

Following is the September statement of the Pioneer Mining Co.:

Gross receipts	$11,858
Pay-roll	4,441
Bills	1,271
Total expenses	$ 5,712
Net	$ 6,146

This $11,858 was from 610 tons of ore, being an average of $19.44 a ton. In August 765 tons of ore were crushed and the yield was $19.01 a ton. The smaller quantity of ore milled in September was due to the unusual shortness of the water supply, and not to any lack of ore of high grade. The superintendent says: "It would be no trouble to keep the mill running to its full capacity, if we had the usual supply of water." He expects soon to have sufficient water to run the mill to its full capacity of 1500 tons per month.

Three of the directors, Messrs. Cutler, Grose and Bickford, were at the mine last week, and expect to make arrangements for additional water power sufficient to run the mill to its full capacity.

The new pay chute on the 1000-foot level was opened on September 30th a length of 51 feet. The superintendent says: "The vein is now 5½ feet wide and the ore coming from it is very good."

Colfax *Sentinel*: The Drummond Quartz mine, eight miles west of Forest Hill, has a record of having produced over $110,000 from a rich pay chute of ore. E. A. Wiltsee, representing English capital, recently purchased this mine from C. F. Reed, of Auburn. The Company is developing the property under the direction of Supt. C. L. Lang. A Pelton wheel with water under a pressure of 835 feet is used to run a fifty-five horse power compressor used in working the power drills. The new lower tunnel, which has passed the 1000 foot mark, will tap the ledge 750 feet below the croppings, and 400 feet below the lowest point reached in the old works. Even with a very low head of water, Supt. Lang has been able to make 50 feet per week in hard formation. The ledge will be 200 feet farther, when an upraise will be made. A tramway from the lower tunnel to the five-stamp mill is building. It is hoped to erect a twenty-stamp mill near the mouth of the tunnel. Thirty men are employed on the pay roll.

During the week the Eureka upraise reached 245 feet.

At the Pioneer Supt. Sullivan will place location notices for water rights on the American river; to make a survey for a dam, and for a tunnel to strike the vein at the 1500-foot level. Work will be commenced immediately toward the erection of twenty more stamps. In the spring another compressor will be added, and those now in use will be moved to the new location near the river. Then the mill, as well as the drills, will be run by air.

Plumas.

(Special Correspondence).—Traveling from Gibsonville, at an altitude of about 6000 feet, one encounters on the mountain sides amid rugged peaks and deep canyons, old prospectors who remind one of the cliff dwellers written of in history and romance. I met one of the "old timers" who hasn't been out of the canyon in fourteen years.

About one mile from Johnsville the Little Jamison is prospecting with good success. The company has just completed an additional ten stamps and placed two concentrators and a canvas plant. They employ thirty men.

The Plumas-Eureka is running fifteen stamps. This, as is well known, is a low-grade proposition. The work has not gone below water level. Twenty-eight men are at work.

P. Laurenzi and others are developing a gravel property into which a tunnel 120 feet has been run and tapped the channel. At this point the bedrock pitches and the company needs capital to run an incline and place pumping machinery. It is a large property situated on Nelson creek.

Placito Laurenzi has bonded to Woodworth & Son of San Francisco, a quartz claim in Gold Valley, Sierra county. Considerable work has been done on the claim. The ledge in the middle tunnel is from 12 to 18 inches and fair grade. In the upraise from the lower tunnel the ledge is 3½ feet.

Johnsville, Oct. 18th, '97.

F. B. Whiting at the Rappahannock quartz mine, French ravine, East Branch district, will commence operations this week.

La Porte reports that work has been resumed on the Thistle shaft. Teams are hauling 1000 cords of four-foot wood to the mine.

San Diego.

(Special Correspondence).—A mill run of ore is now being taken out of the Mountain View mine, near the Stonewall mine, near Julian, by the Mountain View Mining Company, a new corporation, which is developing its property.

A report from the Laguna mountains is that chloride and ruby silver has been struck in the Alpine mine, the ledge being 7 feet wide.

The Laguna Mining and Milling Company is sending out men and supplies to further develop its property in the Lagunas—the late good reports from the camp being an incentive.

San Diego, Oct. 17th, '97.

Santa Barbara.

Santa Barbara reports a number of claims located in Romero canyon, eleven miles from Montecito. Some assays of the ore are reported to go $11 per ton.

Shasta.

Free Press: Development work is being done on the Ancient Channel Gravel mine on Indian gulch, near Reid's ferry, two miles northwest of Redding city, under bond to the Union Mines Company of San Francisco.

The company has put in a steam hoist and pump. They started to sink a shaft in the gravel some 50 feet from the point where the bedrock showed upon the side of the gravel channel. They sunk to a depth of 25 feet and struck the bench of bedrock just where it broke off into a second bench. Continuing downward, parallel with the wall of rock, for a distance of 14 feet, the gravel left them, but they went on for a distance of 11 feet. The gravel could not be found, and at a depth of 50 feet they began drifting from the bedrock wall. They have gone but a short distance and have not reached the gravel deposit. The gravel in the shaft is 31 feet in depth and prospects well, although not rich enough in free gold to pay a large return for working. They expect to find the rich gravel when they reach bedrock in the channel.

J. Conant has bought the North Drift mine, seven miles south of Callahan's, for $22,000, one-half cash, balance in six months.

The Utah and California Gold Mining Company, principal place of business Salt Lake City, Utah, capital stock, $150,000; Walker and Cheeseman. The corporation will operate the Providence and Josephine quartz mines in Old Diggings Mining district.

G. Senn, who has a bond upon the Delta mine, has almost completed arrangements for a 10-stamp mill.

The Mountain Copper Company has commenced the erection of a third rotary smelter. It will be much larger than the other two and will require 500,000 bricks in its construction. It will roast 100 tons of fine ore per day. To burn ore on the hill requires from sixty to ninety days.

A. McDonald has a contract with J. Kahny of Redding, to take out 40,000 tons of ore from the Bowery Bell mine, to be hauled to the smelters at Keswick.

Sierra.

(Special Correspondence.)—In and about Gibsonville considerable ground sluicing and drifting is going on in a very small way. Some work is being done awaiting spring and the melting of the snows. Great fields of gravel lie idle because of injunctions on hydraulics. The Thistle shaft has pumped the water, but whilst the shaft is clear and in good order, the drifts are filled with sand from the flooding that occurred last December. Mr. Wingate, the superintendent, is at present in Scotland, conferring with the company as to future methods of operations. It is certain that work will be started very soon upon some plan, but whether by opening the works at a new place or continuing through the present plant is at present the topic under consideration. This company employs over 100 men when in operation.

Gibsonville, Oct. 16th, '97.

Siskiyou.

The Spencer gold quartz mine, which has just been re-opened by the Golden Star M. Co. of Hollister, is on Humbug creek, at an altitude of 4,275 feet, twelve miles northwest of Yreka.

News: Hunter & Smith have bonded the Barnes ledge in Cherry creek district and are operating it with ten men. The vein is a clean fissure. They are down about 500 feet on the vein which shows 25 per cent galena, copper pyrites and sulphurets.

Mr. Bradley has men at work on the Spencer mine on Humbug creek, under the supervision of Thos. Hegler.

At the Hathaway brothers mine on Sugar creek, on the vein from which they are supplying ore to their arrastra the ground, goes about $25 to the ton, free milling, and at the bottom it is about the same with some sulphuret ore coming in that goes $72 per ton and four ounces of silver. The gold seems rusty and the arrastra only saves about $15 per ton.

Trinity.

The Cle Fse will mine this year on their property adjoining the Fred Haas mine, and are putting in a 36-inch pipe line.

The Enterprise group of mines is six miles from the town of North Fork, and consists of eight locations. The Enterprise location is operated by four tunnels and nearly $175,000 has been taken out. The vein is 18¼ inches in width, the walls being diorite and greenstone. Work is now being done on an extension of the Enterprise called the Lone Jack. The vein trends southeast and northwest and has a 30° dip to the north. The ledge averages 24 inches in width and in the winze has increased to 30 inches. This ledge is in granite. The ore is a hard white quartz carrying galena sulphurets. A tunnel has been driven in on the vein at a distance of 150 feet from the surface. They have crosscut in both directions from the end of the tunnel a distance of 350 feet along the pay chute.

News: The reported sale of the Union Hill group of mines at Douglas City was an error. Recently an extension of four months time was given on the bond.

Tuolumne.

The Grant G. M. Co. on the Grant mine, seven miles from Chinese Camp, have been receiving new machinery on a large scale. Chas. P. Keith has been appointed superintendent.

Jas. Broyson of the North Star and Black Warrior gold mines is opening up the mines.

The Santa Ysabel mill is reported shut down because of lack of water. Advices from the mine state that "the indications are that we shall have to wait for the fall rain. In the meantime we shall arrange to run our mill by the steam plant which we have on the ground as an auxiliary. The work from No. 3 crosscut on No. 3 level shows an improvement and indications of being near an ore body. There are at present stringers of quartz cutting through the mineralized slate showing gold at many points. The ore seems identical with ore in the Jumper mine. We have opened out another small but quite rich pocket on the Mascot vein. Development work for the week amounted to 212 feet, most of which was sinking and drifting on No. 2 shaft. No. 4 shaft was sunk 45 feet."

Democrat: R. M., T. T. and S. Swan, J. H. Howland, four mining men of Alaska, and later of South Africa, have made a deal with M. Davis for the lease, with the privilege of purchasing, of the White Lead mine, one mile north of Columbia.

Democrat: At the Rawhide the mine proper is being worked and the triple chlorination works kept running, but aside from these all other branches of the plant are temporarily closed down for lack of water. In the mine the main shaft is being driven, present depth 1270 feet, where there is a 30-foot ledge of the usual high-grade quartz. At the 1200 crosscutting is under way. Drifting north on the 900 level shows body of ore in the face. An

upraise is being run from the 700 to the 600 to tap the recently discovered ore chute on the latter level. The vein at point of this late strike is 18 feet wide, and includes some of the best rock ever seen in the mine.

Independent: The Sell mine near Sonora is reported sold to Fresno men who are now extensively operating the Kanaka mine south of Groveland.

Mr. Soulsby is reopening the old North Fork mine, about three miles northeast of Soulsbyville.

The Hibbing mine at Soulsbyville has passed into the hands of the Hibbing G. and M. Co. The company is putting in a steam hoist.

The Maryatt Company at Tuttletown is arranging for the construction of a 20-stamp mill.

The Shawmut mine is running only five stamps on account of little water.

NEVADA.

At the annual meeting of the Eureka Consolidated Mining Company this week, about 38,000 of the 50,000 shares of capital stock were represented. The old directors were re-elected. The company has $5000 on hand; no indebtedness.

The America Gold Mining Company, capital stock $200,000, owns the Young America mining claim, adjoining the property of the Dexter Mining Company at Tuscarora. There has been two openings on the vein in the Young America, one at a depth of 120 feet, at which point the vein was followed for 120 feet. Another shaft was put to a depth of 85 feet, and at present a permanent working shaft is being sunk to the vein. R. L. Andrew, Salt Lake city, Utah, is secretary. The ground of the company is favorably located.

The Sutro tunnel taps the C. & C. mine at a point 10 feet above the 1750-foot level, but the water stands 3 feet below the 1750-foot level, so that when a cage is lowered down until its upper deck is on a level with the floor of the 1750-foot station the lower deck is submerged. The *Enterprise* says a singular phenomenon is observed at this point; there is an ebb and flow of the waters as if they were directly connected with the waters of the ocean. This phenomenon has been noticed by all the miners. A most singular thing is that each Sunday the water rises several feet higher than during any other day in the week. When the men go to work Monday morning there is always a clear high water mark where the water has encroached on the 1750 level during the day before. Mr. Hawkes, foreman of the mine, is of the opinion that somewhere in the country water is used during Sunday. This may lead to an interesting clew regarding the course of subterranean water courses.

The Pioche *Record* says the lesses of the Lyndon mine in Comet district have concluded to quit work. The low price of silver is the principal cause. They have been working quite a force since last July and have done a considerable amount of dead work. The mine shows large quantities of sixty-ounce ore, but this is not high enough to bear the heavy expense of extraction, freight and working charges, with silver at its present price. Several cars of shipping ore will be sorted out from what has lately been extracted, and the mine will be turned over to the owners.

At the annual meeting of the Consolidated California and Virginia Mining Company Superintendent Lyman reported that for the twelve months ending September 30, there was produced from the 1550, 1650 and 1750 levels of the mine 2901 tons of ore, which yielded bullion of the gross assay value of $104,136, of which $46,372 was gold and $57,765 was silver. The average yield of the ore in bullion was $35.89 per ton.

Following is an official statement of the dividends paid to date by the companies composing the Consolidated California and Virginia Mining Company: California, $51,320,000; Consolidated Virginia, $42,930,000; Con. Cal. & Virginia, $3,898,800; total, $78,148,800, a record unsurpassed by any other mine in the nation.

White Pine *News*: The erection of hoisting works at the North Mountain Company's mine at Cherry creek, is being proceeded with, and plans for the erection of more rolls for the mill have been forwarded to Salt Lake City for the approval of the directorate. The capacity of the mill will be increased to eighty tons a day.

OREGON.

Near Baker City, the North Pole mine, the Bonanza, the Red Boy, the Don Juan, the California and the Columbia will, it is locally reported, add enough stamps to their plants to almost double their present ontput. The Union-Companion is reported to have produced $50,000 last month.

At Ontario placer mining is the chief industry. J. Morton has sold his Island placer, cotaining 1200 acres, to Omaha parties for $15,000, and his homestead mine and ranch to D. Wilson for $10,000. The bars are low but rich, some of the gravel and black sand running as high as $9 per yard. One company is using gasoline engines and centrifugal pumps on the bars and cleans up $100 per day to the machine. Mr. Franks is manager. Miners are making good wages all along the river with rockers.

At Davis Island Netherby & Davis have cleaned up $600 in thirty days with a beach machine. This is a dredging proposition, as the richest ground is under water.

The Baker County Mining and Development Company will operate quartz and placer claims in Baker county; amount of stock is $600,000, non-assessable.

About forty-five men are on the pay rolls of the Oak Flat placer mines. The companies' ditch from Soldier creek to the opening of the mine on the Illinois river, 6 feet at the top, 4 feet at the bottom and 3 feet deep, is practically completed. It has a capacity of 2100 miner's inches.

From A. M. Brown, manager Oak Flat placer mines, the observer learns that the ditch from Soldier creek to the opening of the mine at Illinois river is practically completed. This ditch is 6 feet on top, 4 feet bottom and 3 feet deep. The capacity is 2100 inches of water, between 600 and 700 feet of flume will have to be put in, and then everything is ready for the winter's run. Forty-five men are on the pay roll at present, but this number will soon be cut down as soon as the preliminary work is completed, which will be in a short time. A saw mill has been put in with a capacity of 2000 feet per day. Two giants are to do the work of moving gravel, 1900 feet of hydraulic pipe, 11 to 26 inch, is all in place. Also a new hydraulic power derrick with a capacity of five tons has been constructed for the handling of large boulders that will not pass through the tailings flume.

JACKSON AND JOSEPHINE COUNTIES.

A strike is reported made in the Elk creek country of a large body of low grade ore. "The ledge is 400 feet wide and is a contact vein between granite and porphyry walls. The ore assays on surface from $2.65 to $6.80 per ton."

Fitzgerald & Frakes on Elliott creek, at the mouth of Silver Fork, have opened up a bed of talc, lime and quartz near the head of Dunamoor creek, from which they claim they have been able to get seventy-five cents to the pan by pulverizing the stuff, which is soft and largely decomposed, by hand. There appears to be a wall of porphyry, but the formation is peculiar and a remarkable one in which to find gold in quantity, if at all. Other parties who have examined the ore found colors but nothing rich. These men exhibit some fine specimens of dust which they claim to have panned from their mine.

In Josephine county, southern Oregon, M. Keller, manager and consulting engineer, has fifteen men employed, principally on the main tunnel which is 480 feet long and within 30 feet of the main ledge.

WASHINGTON.

At Boundary, the Belle of Waneta group on Fish creek has been sold to Davenport & Co. of Trail, for $12,000.

BRITISH COLUMBIA.

(Special Correspondence). — The Klondike fever is about over for the season on the Canadian coast. Hundreds of Canadians have returned from the Yukon with the idea of going back in the spring. In the meantime merchants in Victoria and Vancouver are laying in big supplies for the anticipated rush next March. There is no doubt that the sad face of ex-Mayor Fred Cope of Vancouver who was drowned in Shallow lake September 18th, will deter many from going to Klondike from Vancouver. The late Mr. Cope was active, energetic and widely popular, and the sad ending of his venture has visibly influenced others.

The Bleweths, of Chicago, father and son, are still working energetically on their Van Anda properties on Taxada island. They have now over 3000 tons on the dump, which will average $40 a ton, while 200 tons were shipped to Swansea to-day which would average about $40.

There is nothing new in smelter matters. Big bonuses are still asked from the citizens in Vancouver and Victoria, and the citizens think that if their locality is a good place for a smelter, some company will be forthcoming to erect one without a bonus. The fact that a smelter is to be erected in the interior, in a measure makes the scheme less attractive, because a coast smelter would then only be able to treat coast ores. However, it is believed than enough mines are now producing ore to supply a large smelter.

The Excelsior, next to the Golden Cache, Cayoosh creek, Lillooet, have a tunnel in 120 feet, and have struck ore running from small values to $79 in value. This week for the first time the company placed 25,000 shares on the market at 30 cents to raise money to push work in the lower tunnel.

Vancouver, B. C., Oct. 16th, '97.

(Special Correspondence.) — Vancouver's smelter is an assured fact, but it is not to be built in the city limits. The City Council, provided the people agree, have promised to give the Harry Symons syndicate, in which one of the London Rothschilds figure, $65,000 in cash in exchange for $65,000 worth of stock in the new smelter, provided the Symons people will erect a million dollar smelter within a year, or failing to do this will forfeit $5000. The smelter will be situated at Hastings, about four miles east of the city limits on the Canadian Pacific Railway. This agreement disposes of the offer of Mr. Remington, of Salt Lake City, who offered to build a million dollar smelter for a bonus of $100,000 or forfeit $10,000. The Remington people were practical American mining men. The Symon syndicate are financial people.

The Poorman mine, Nelson, worked by the Davenport Bros. for four years at a profit of $25,000, a 10-stamp mill being used, has been sold to Johann Wulffsohn and others of this city. The new company are running a tunnel in vertically below the present tunnel to tap the vein. This will be done, they believe, at another 100 feet.

Vancouver, Oct. 18th, '97.

The daily output of the Payne mine, Kaslo, is seventy-five tons. Its shipments are divided between the Everett and Pueblo smelters. The new three-track tramway for the Payne is one and a half miles long. The Reco ships sixty tons per week to Omaha. The output will be greatly increased when the rawhiding season opens.

The Miners' Union of Rossland warns miners to stay away from the camp, as there is a surplus of men there now.

Nelson *Tribune*: During a period of 33 days ending September 30th, 6210 tons of ore were treated by the Hall mines smelter, producing 522 tons of matte, containing approximately 249 tons of copper, 141,860 ounces silver, and 98 ounces gold.

During September there was entered at the port of Nelson for export, ore and matte of the value of $188,184, more than half of which was smelter product from the Trail and Hall mines smelter. A new feature of the exports for the week was an entry of 753 ounces of gold bullion from the Trail smelter valued at $12,841. This week's exports brings the total value for the year up to $6,250,701. The returns from the outport of Revelstoke for the month of September have also been received, which shows that during the month 674 tons of Slocan ore valued at $96,492 were exported via Revelstoke. These figures added to the returns of the port of Nelson show that during the month of September the mines and smelters of southern Kootenay exported ore and matte to the value of $810,717.

The Rio Tinto Mining Company of Spain, which owns the greatest copper property in the world, is also the real owner of a most valuable group of mines on Pyramid creek, in this district, says the Fort Steele *Prospector*. The claims number fourteen in all, and on several of them good development work has been done. At one place there is a dump of silver-copper ore valued at $5000 and a force of forty men are now at work. Next year a 6-drill air compressor is to be put in, and preparations are already being made to receive it.

ALASKA.

The Alaska Treadwell Gold Mining Company during September crushed 21,354 tons of ore; 417 tons sulphurets were treated, the former averaging $2.50 per ton and the latter yielding $18,159. The bullion product for the month was $53,563. The company also sent down $13,815 in gold for account of the Alaska Juneau Company.

The Alaska Mexican Mining Company worked 13,118 tons ore in September, averaging $1.80 per ton, and treated 249 tons sulphurets, yielding $6399. The gross expenses for the month were $19,849. The company reports a bullion product of $23,356 for the month, besides $4598 shipped on account of the Alaska Juneau Company. There was also a shipment by the same steamer of $11,073 on the October account of the Alaska Treadwell Company, a clean-up of the chlorination works.

The Alaska Treadwell Mining Company has a bullion shipment on October account valued at $11,073; a clean-up of the chlorination works.

IDAHO.

At Florence it is expected ten or twelve mines will be put on a paying basis this fall, among them the Banner, Gold Bug, Hiyu, Blossom, Poorman, Trilby, Waverly and Briscoe.

The Blossom was recently sold to Captain N. D. Moore of Spokane, who has a 10-stamp mill en route.

At the Hiyu C. King of Spokane is putting in a new 5-stamp mill.

The Watsen, a new discovery on the Salmon, is proving rich, and a stamp mill will be put in next spring.

There are 500 prospectors and miners in Florence district, of whom 200 are on pay rolls.

The dredge operated by the Warren Placer Mining Company at Warren, excavates 700 yards of gravel per day, the average value of which is 30 cents per yard. Twenty men are employed and work will continue thirty days longer.

Cusick & Thompson of this city are at work on a gravel bar on Snake river, near the town of American Fork, using a new gold catching appliance of their own invention, made in Butte. While its capacity is meager, it is said to save 92 per cent of the very light gold found in this gravel.

Silver City *Avalanche*: The Alpine Group, owned by Messrs. W.N. Nichols and E. Lewis, has been purchased this week by the Trade Dollar Mining and Milling Company. The purchase price has not been made public, but is upwards of $30,000. The Alpine group lies just west of the Trade Dollar group, and can be worked to unusual advantage by crosscutting from the levels of the latter property.

UTAH.

"The best tonic that can possibly be prescribed for the diggings at this time," says Manager A. Hanauer of the big plant which bears his name, to the Salt Lake *Tribune*, "is a reduction of the rate on ore, and that can be done only by the railroads. Some persons who have made comparison between smelting charges at Denver and those in this valley have suggested that the local smelter might reduce its charges, but they are awfully lacking in information. One item alone in the operation of the smelter at the respective points is sufficient to show the disadvantages under which we in this valley labor in the attempt to compete with the smelters of Colorado. At Denver fuel is unloaded at the furnace for $6. Here we are compelled to pay $9.75 for the same thing that costs them $6. Other supplies correspond. The railroads, it appears to me, however, have it in their hands to relieve the situation without making any great sacrifice, and were a reduction in the rate on ore only until such time as the struggle for bimetalism is settled it would infuse new life into the camps, loosen up capital and stimulate development throughout the State."

It was upon the producer of lead that the present blow from the metal market is visited, the market opening at $4 per hundred pounds and dropping down to $3.75, at which figure it closed. The blow was not unexpected. At least that was what was said by the management of the Hanauer and repeated in the offices of the Germania. Each referred to how the advance in lead, which on September 7th, last, reached $4, had stimulated the production of that metal, which has been pouring upon the market until it is said to have become a drug. The demand having been exceeded, the smelter men contend that it was but natural for the price to decline, and the decline having started no one will undertake to foreshadow its fate.

Salt Lake *Tribune*: The present reign of inactivity at the Ontario and Daly mines, Park City, will continue indefinitely. This is the information with which Hon. R. C. Chambers yesterday returned from California, where he was closeted with some of the directors: "The mill must necessarily shut down, as we cannot produce bullion with any profit for less than 75 cents per ounce. At the solicitation of Senator Stewart of Nevada we, some three years ago, prepared a statement in which it was demonstrated that at that time the actual cost of producing an ounce of silver under most favorable circumstances, was 65¾ cents an ounce, that with the mine open, with the ore bodies accessible and in good shape and everything in condition for economical extraction. As a matter of course, the above figures do not include the capital invested in machinery, the cost of equipment of mine and mill, nor do they represent the vast amount of money that has been expended in the driving of a long tunnel that the cost of extraction might be even further reduced. Then there is the endless list of incidentals with which all experienced miners are familiar. Let me assure you, however, that both companies will be glad to resume at any time, but that resumption must be at a small profit to themselves."

The *Patriot* predicts an early revival of operations throughout the district of which Park City is the center and that it will continue without cessation through the year '98. "There is now ample truth for asserting that the Daly-West will resume operations in a short time. On the dumps of the Daily-West are several thousand tons of ore which will be treated as soon as the new machinery is set up."

MONTANA.

The Anaconda Copper Co. is developing a coal mine at Joliet, sinking a double compartment shaft 7x17 feet in the clear. To reach the coal requires a depth of 1000 feet to have been reached before the coal can be mined. This will take five or six months to complete and a big outlay of money. The Anaconda company expects that when in operation these coal mines will have an output of 2000 tons a day.

Inter-Mountain: The history of the copper industry in Montana extends back fifteen years, in 1882 the present great producers of the district were passing through the crucial test of early development. The year preceding the Alice had paid in silver dividends about $350,000, the Lexington had been transferred to a French syndicate for $1,000,000 and its great silver properties were attracting the attention of Eastern and European capitalists.

It was during the year 1881 that the active search for copper began. In May the Anaconda had been purchased for $30,000, and in October of that year the Mountain Consolidated Mining Company had been incorporated with a capital of $4,000,000, by W. A. Collinwood of New York, and Marcus Daly, J. A. Talbot, R. S. Jones, Prof. J. E. Clayton, O. P. Blaine and H. S. Clark of Butte. The claims included in that group were the Burnett, Buffalo and Mountain, now owned and operated by the Anaconda Company. At an eatlier date, in July of the same year, 1881, Prof. Clayton had made his famous report on the Bell mine. He reported the value of the visible supply of first, second and third-class ore in sight at $1,380,000, and was derided and scoffed at. That his judgment was correct may be determined from the fact that sixteen years later the Bell is considered the banner shaft of the Anaconda Company. At a depth of 1400 feet 50 per cent copper glance, six sets wide is being daily broken and hoisted to the surface.

The Colorado smelter had been running in a small way since 1878. The Parrot smelter started up two stacks under Mr. Migeon in July, 1881, and in September of the same year the Bell smelter was blown in. Most of the ore treated during that year by the smelters was the silver produced in the camp, and in 1882 the *Inter-Mountain* heralded it as an important factor in the growth of the new camp, that the daily output was 300 tons of ore per day. In this year the output is not less than 10,000 tons, of which the Anaconda Company produces considerably more than one half.

In March, 1882, copper reached a high mark —19½ cents—and with the knowledge that there was almost exhaustless quantities of the mineral in the district the development increased and has kept increasing at a wonderful rate. The following figures of production of copper in pounds fine for Montana from 1882 to 1897 (the output of the present year being estimated), will prove interesting:

1882	9,058,284
1883	24,698,364
1884	43,098,346
1885	67,797,881
1886	57,611,621
1887	78,699,677
1888	97,897,968
1889	98,222,444
1890	110,955,733
1891	112,389,340
1892	161,051,477
1893	154,300,100
1894	183,094,755
1895	194,768,925
1896	228,958,164
1897 (est.)	250,000,000
Total	1,872,571,629

What a hole in the earth this more than 850,000 long tons of copper represent! Taking copper at an average value of 11 cents, it means a total value of over $200,000,000 for the copper produced in Bunte alone, for outside of a very inconsiderate portion, Butte produced it all. But Butte is capable of even better things.

Bystander: The Anaconda Company is sinking on most of its mines. At the Diamond the shaft is down close to the 1300-foot level. At the Green Mountain a station is being cut on the 1600-foot level. The High Ore shaft is down close to the 1500-foot level, the High Ore No. 2, 1600-foot; the Mountain Consolidated No. 1, close to 1500-foot; No. 2, 1500-foot, with station cut. At the Never Sweat sink-

ing is in progress below the 1400-foot. At this mine a skip, holding eight tons of ore, is used in one compartment of the shaft, with a four decked cage in the other hoisting compartment, the cage being the most convenient to hoist men and timber. At the Ramsdell Parrot about 200 tons of ore is hoisted daily. About forty men are employed. At the Gagnon about 200 men are employed. At the 1500-foot level the vein is from 30 to 40 feet wide; preparations are being made to sink below this level. About 500 tons of ore are hoisted daily.

WYOMING.

G. F. McLaughlin, Harry Eckline and C. Henschaw of the Edison Mining Company at Paterson, N. J., are at Sheridan, Wyo., for the purpose of inspecting the development work done upon the company's platinum property on Piney creek. A large amount of machinery, consisting of drills, air-compressors and other mining tools, has arrived and will be put in operation at once. The mines will be worked during the winter. The product is used by the Edison manufacturing works in New Jersey.

COLORADO.

(Special Correspondence).—Ward, Boulder Co., is eighteen miles west of the town of Boulder, in the proximity of Bald mountain and Long's peak. The district is well watered, well timbered, rough, rugged and at an altitude of from 9000 to 10,000 feet above sea level. It is in the sulphide belt, which trends through Clear Creek, Gilpin and Boulder counties. The mines produce here the same character of iron and copper sulphides that abound in Clear Creek and Gilpin counties. The product here is divisible into two classes: first-grade smelting ore having an average value of $100 per ton; second-grade or milling ore averaging in value $10 per ton. The first-grade or smelting ore constitutes about 5 per cent of the product of the camp, the second-grade or milling ore making up the 95 per cent of the product. The first-grade is all shipped to the smelters direct, while the second-grade is either milled on the ground or it remains on the mine dumps. About forty-five tons per week, valued at $4500, are shipped to the smelters, which is figured at 5 per cent of the camp's output. About 900 tons a week, valued at $9000, would be the product of milling ore taken from the mines. At this rate the district is producing about $700,000 per year. The second-grade or mill ore runs as low as $3 and as high as $15 per ton. As an example, the Dew Drop mine in the course of its development milled 7000 tons, which averaged in value $6.78 per ton. At a better stage of development the same mine is producing ore which runs from $10 to $12 per ton. Ore in the stopes of this property is 12, 15 and 20 feet in width. The Dew Drop tunnel is in 1125 feet, with 1000 feet timbered and having 600 feet of levels. The Adit tunnel is in 1800 feet, and this is to be driven 3000 feet farther to cut the Ni Wot grounds, which latter property was recently acquired by the parties controlling the Dew Drop and Adit mines.

The Ni Wot has a history. The property is situate on the saddle between Ward and Camp Frances. It was opened in 1862 by wealthy New York parties. For fifteen years it was one of the noted mines of the State. It was the cause of the establishment of Ward camp. Under the crudest conditions it produced $48,000 in six months. During its entire career it is credited with a production of $1,250,000. In 1868 a 50-stamp mill was built at a cost of $250,000. At that time it was the largest mill in the State. When the mill was practically complete, and before a wheel was turned, it was totally destroyed by fire. It was rebuilt at a cost of $150,000 and was operated for about twenty years, ending in 1888. The ore bodies are claimed to have been very remarkable. In places the vein matter was 30 feet wide. Twenty years of operating shows a dump of only a few thousand tons, which suggests very little waste. It is asserted the ore yielded $80 per ton on the plates and that the mill product reached as high as $2500 per day. These great values were close to the surface, as is evidenced by the fact that the lowest workings were only 450 feet. Through disputes and litigation the mine fell into disrepute and remained idle from 1888 to this time. The new corporation now in control has purchased the property and assumed the claims against it, which are said to have aggregated $217,000. The new company state that they will expend $350,000 in developments. The Ni Wot will be developed and worked through the Adit tunnel.

The Utica mine and mill, which have been operating for nine years, have a shaft 750 feet deep and extensive underground developments. The mine is now producing at the rate of about $6000 per month. This rate of production has kept up for eight or nine years and in that time it has not ceased to be a steady producer. The Utica tonnage amounts to about 650 per month.

The Ward-Rose mine, in Puzzler gulch, possesses a new plant of machinery and in the course of its development has produced some ten ounces gold ore.

The New Market mine was recently sold by Walters, Larson and Kline for $25,000, the purchaser being B. I. Potter, trustee for his Boston associates. The ore in the New Market runs about $40 per ton in gold.

The John Jay mine is being provided with a mill having the Beam process of roasting and converting. Six muffles are being put in and the mill will have a capacity of 30 tons per day. This property is in the tellurium belt, five miles from Ward.

The San Blas mill, having ten stamps and concentrators, will soon be in operation.

The Star mine, in Spring gulch, is being being worked largely by leasers. It is producing sulphide ore, having gold values running as high as six ounces.

The majority of the mines of the district belong to New York, Pennsylvania and Massachusetts people.

The B. and M., close by Ward, is developing from a 400-foot shaft and is under a bond and lease to the operators. A recent shipment of sulphide ore yielded about $70 per ton in gold.

The Ruby mill, with stamps and concentrators, located in Puzzler gulch, is complete and operating on ores of the Ruby mine.

At Col. Brainard's camp, two or three miles from Ward, is his very modern power house, where a system of water wheels are driven by 740 feet head of water, which is flumed and piped from Mout Audubon. The power thus produced runs a system of dynamos by means of which power is transmitted to the several mines, mill and concentrator some distance away.

The Colorado & Northwestern Railway Company, which, it is claimed, is backed by heavy capitalists, is constructing a line of road from Boulder to Ward. A large force of men are at work and the plans contemplate that the line will be completed by the close of this year. It is claimed the destination of the builders is Routt and Rio Blanco counties in northwestern Colorado, thence on into Utah. The completion of this road will give Ward shipping facilities which will be greatly to her advantage. It may lead to the enlargement of Ward's milling facilities to handle her low grade ores. I predict that this will become a mining and milling camp the equal of Gilpin county. WASCOTT.

Ward, Colo., Sept. 20th, '97.

A Denver dispatch of the 18th says: The flooded mines of Leadville will not be pumped out. Eben Smith, chairman of the committee appointed by the mine owners to secure funds to buy and operate the necessary pumps, said to-day the pumps would not be started as long as silver remained at the present low price. In addition to $50,000 contributed for the purpose of unwatering the mines, it was found that $25,000 more was needed, and it is impossible to raise this, as David H. Moffat, one of the principal mine owners, has flatly refused to give another dollar.

ARIZONA.

(Special Correspondence).—The Copper King of Arizona is making progress. No. 1 shaft is now down 300 feet in black sulphide copper ore and drifting has begun. As soon as ground sufficient is opened up the company will erect a smelter of 100 tons daily capacity.

Bisbee, Oct. 12.

At the Congress mine, W. F. Staunton superintendent, 425 men are employed; monthly pay-roll $30,000. The daily output is 120 tons ore, averaging $20 and a shipment of twenty-five cars per month of high grade ore. The 40-stamp mill crushes the ore from three shafts. No. 1, 1750 feet deep; No. 2, 1400 feet; and No. 3, 1100 feet. No. 1 is lighted by electricity. A new hoisting plant has been ordered for No. 2, capable of going to a depth of 3000 feet, and in shaft No. 3 a similar hoist will be placed, capable of hoisting a load of 20,000 pounds at the rate of 1000 feet per minute, for 3000 feet depth.

At the cyanide mill 100 tons of tailings are handled daily. The company intend to enlarge this branch of the business.

G. O. Pearce, representing the Rio Colorado Gold Extraction Co., is in Yuma making arrangements to erect a 5-stamp mill on twelve mining claims in the Chocolate mountains, about eighty miles up the Colorado river. The mill will be shipped up the river on the steamer Mohave as soon as it returns from the sulphur mines in Lower California, and used developing the claims on which the Colorado company holds a bond from Taylor D. McLeod.

The machinery for the Kasser Gold Mining Company, near Globe, is in place. The hoist is capable of sinking 1000 to 1200 feet; general manager, M. Gibbons.

It is reported from Globe that four copper mining companies of that camp have tired of waiting for the new railroads promised and have concluded to begin work on a broad-gauge line of their own. The road is to be constructed to Phœnix on as direct a line as possible, running near Goldfields and possibly including Mesa and Tempe. The reason why Phœnix has been preferred is that here competitive rates could be secured over both the Santa Fe and Southern Pacific. Not a furnace is running in Globe, though development is being pushed on all the mines and thousands of tons of rich ore are piled up on the dumps and in the smelter bins. New machinery is as well being installed, and only low freight rates for coke and copper are necessary to make the camp a lively one.

News: At Willcox, Manager Payne of the Grand Reef copper mine in Aravaipa canyon, is putting in new machinery. There are 200 men working in the Aravaipa canyon, at the head of Sulphur Springs valley. Fifteen miles southeast of Willcox lie the mountains in which is located the Dos Cabezas gold mining district. About thirty men are scattered about the district working claims. On the Cottonwood property there is a 5-stamp mill. The shaft on the Cottonwood is down 200 feet and three levels are run.

The Golden Rule copper mines at the east end of the Dragoon mountains are being worked by Kansas City parties. The shaft is down 135 feet and levels run 150 feet.

In the old Benson smelter building there is in operation a concentrating plant, put up by F. S. Webster, run by two 6 H. P. gasoline engines and handles twelve tons per day. The ore is from the Golden Rule mine, on the coast side of the Dragoons, and is hauled by the railroad for $1 per ton. The ore carries lead, silver and gold. The old slag dump of the Benson smelter contains on estimate 5000 tons of slag, which is being worked at a goood profit.

Oasis: C. J. Eames, Sr., ex-superintendent of the Columbia Smelting Co., at Rollin, formerly the Empire Smelting Co., is in Nogales on mining business. His company at Rollin have in contemplation the construction of an ore railway from Rollin on the N. M. & A. to Washington Camp. This will give an outlet to the rich mines at Washington Camp, and gives those operating them a chance to get the ore to a smelter at a nominal cost. The new ore road will be fitted with twelve ton engines and five ton cars. There will also be added to the smelter at Rollin two more stacks, one for lead and one for copper. Mr. Eames is looking for more copper mines for his company, and was in Sonora during the week making some examinations.

NEW MEXICO.

Of the Mogul Mine Company, the Socorro *Advertiser* says: The shaft is down 125 feet, and the drift is in 25 feet. A good body of ore is in sight.

ALABAMA.

(Special Correspondence.)—The following tables give the mineral production and manufactured product therefrom, for the State of Alabama, during the month of August, 1897, as reported by the producers to Dr. Eugene A. Smith, State Geologist and Secretary Alabama Ind. and Sci. Soc.

Material.	*Tons.*
Coal	401,506
Coke	109,270
Iron Ore	136,958
Pig Iron	62,279
Flux	21,874
Bauxite	808
Building Stone	5,000 cubic feet
Total number of employees	12,960

WM. M. BREWER.

Birmingham, Alabama, Oct. 8.

Recent California Mining Incorporations.

Poor Man's G. M. Co., Groveland, Tuolumne county.—F. Lindsay, J. Carlton, F. Akinson, J. C. Moody, C. McZurnaham; capital stock $250,000; subscribed $27,500.

Towle and Stetson Alaska Commercial and Mining Co., San Jose.—B. F. Towle, W. B. Hayford, C. H. Johnson, J. B. Stetson, J. Parmer; capital stock, $250,000; subscribed, $200,000.

Contact G. M. Co., Los Angeles.—E. E. Perrine, G. Woods, H. A. Howard, S. Littlefield, F. C. Smythe; capital stock, $200,000, all subscribed.

Yosemite Mining and Development Co., Fresno.—J. A. Hacker, A. J. Pedar, C. A. Shattuck, T. M. Hayden, C. H. Emmons; capital stock, $1,000,000; subscribed, $717,000.

Columbia G. M. & M. Co., San Francisco. G. Gall, N. Hansen, T. Forniski, D. Meyer, T. B. Dillon; capital stock, $1,000,000; subscribed, $500,000.

Tuolumne M. L. M. & D. Co., Fresno. N. W. Moody, T. R. Brown, J. Scott, J. L. Marble, H. E. Barnum; capital stock, $250,000; subscribed, $1575.

Recently Declared Mining Dividends.

Alice Mining Company, Utah, $20,000; payable Oct. 25; a total of $1,035,000.

Standard Con. M. Co., Bodie, Cal., 10 cents per share, $20,000; October 20th.

The Boston and Montana Mining Company, Montana, $3 per share, $450,000; payable November 20th—total dividends, inclusive of this one, $6,725,000.

The Alaska Mexican Mining Company, quarterly dividend, 10 cents per share, $18,000; payable 28th inst.

Alaska Treadwell G. M. Co., 37½ cents per share, $75,000; payable Oct. 28th.

Personal.

A. B. CARDWELL, of San Francisco, is now foreman of the Ione Mountain mine, Shasta county, Cal.

Dr. J. M. MERRILL of Montana, is in San Francisco seeking California investment in Montana mines.

E. R. ABADIE, formerly of Grass Valley, is now general manager of the Grand Central mines, Torres, Sonora, Mexico.

F. W. EDELSTEN, proprietor Los Angeles *Mining and Metallurgical Journal*, is in San Francisco en route to the north.

MAJOR HEUER of the U. S. Corps of Engineers has returned from protracted official duties in the Mississippi valley.

H. W. TURNER of the U. S. Geological Survey, who has had charge of government work in the Yosemite for the past ninety days, is in San Francisco en route to Washington, D. C.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

1 New Giant Drill

Arranged to run by AIR or STEAM.

With Column Clamps and Numerous Extra Parts. Apply to MILLER, SLOSS & SCOTT, 18 Fremont Street, San Francisco, Cal.

FOR SALE CHEAP.

Gold Wet Washing Machine,

MAIT'S MAKE.

Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco

A HIGH GRADE Gold and Copper Property, FOR SALE AT A SACRIFICE.

HAVE GOT THE KLONDIKE FEVER. For Samples and Particulars, Address

JOHN P. CLARK,.....Cisco, Placer Co., Cal.

MINE RAILS and PIPE.

We have for Sale a large lot of **16-inch Rails for relaying** and **Four Miles of 10 5-8-inch Casing.** Can also supply New Rails and Pipe, direct shipment from mills.

LEE CHAMBERLAIN & CO.,
256 So. Spring St.....Los Angeles, Cal.

WANTED.

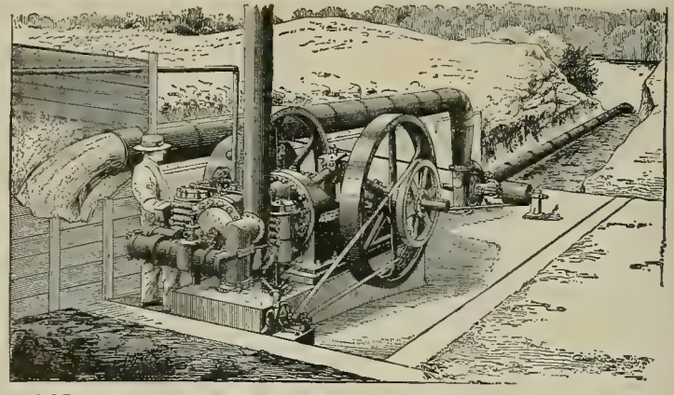
By a graduate mining engineer (age 29) any position in a mine, mill or office that may lead to advancement. Have my own surveying outfit.

Address L.C., office Mining and Scientific Press.

WANTED — GOLD AND COPPER MINES.

We have customers wanting to purchase good developed Mines. Drawings and Report required. Will mail latter to fill out, when requested. Six to nine months' bond necessary, which need not stop work.

Will also put stamp mill on good mines, for half interest. Address RUSSELL & POOLEY, 449 Wilcox Building, Los Angeles, Cal.



LARGEST GASOLINE PUMPING PLANT IN THE WORLD

The illustration shows the gigantic pumping plant recently built by the Hercules Gas Engine Works on the Packer Ranch, Colusa Co. 80 h. p. Hercules Engine, pumping 7200 gallons a minute, 27 feet high. Burns Gasoline or Distillate oil. Cheapest power known. Gas, Gasoline and Oil Engines, 2 to 200 h. p. Send for Catalogue. HERCULES GAS ENGINE WORKS, 217 Bay St., San Francisco.

MINING MACHINERY, Second-hand.

WILLIS SHAW,

Contractors' Machinery, 506 N. Y. Life Bldg., Chicago, Ill.

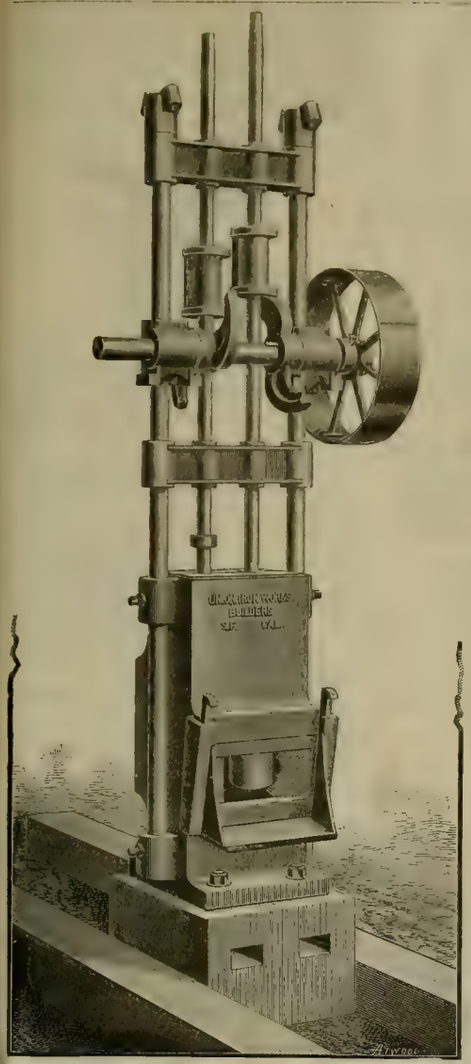
✦ PRINTED LIST NOW READY.

✦ WRITE FOR A COPY.

NOT SCRAP IRON,

But First-Class Machinery

Of standard make and modern design. Have most everything for Hoisting, Excavating, Crushing, Pumping, Quarrying, Etc. All repaired and ready for service. ATTRACTIVE PRICES.



PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

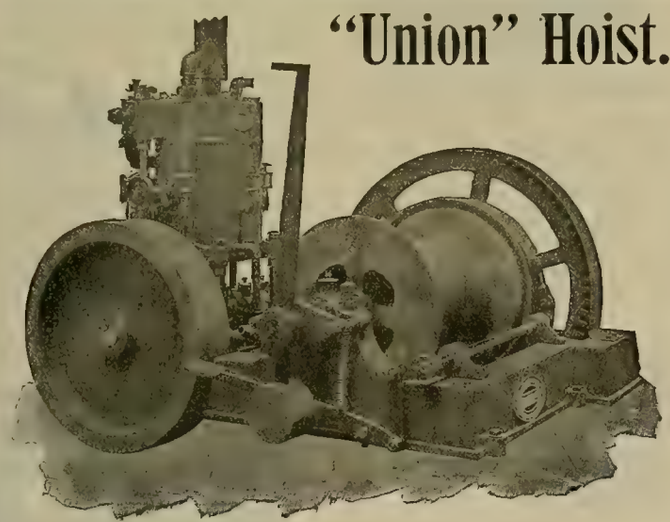
It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Yukon Boats and Sleds.

Stern Wheel Boats, 25 ft. to 200 ft. in length. Light draught. Shipped--knocked down--and set up at St. Michael's ready to run. Send for Circulars and Prices.

DENVER, COLO.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying Gold .....AND..... Silver Ores.
By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores.") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

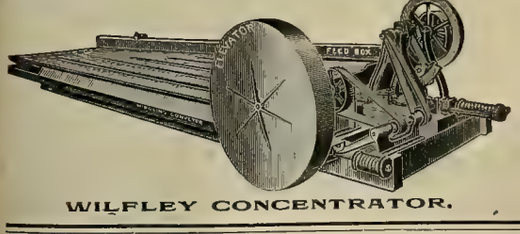
SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.



WILFLEY CONCENTRATOR.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

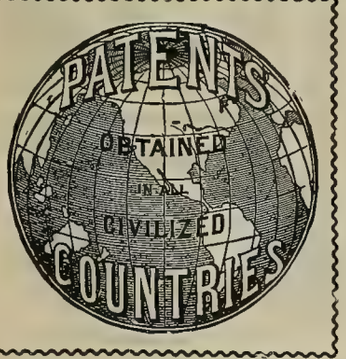
PATENTS



DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals an Rules provided for in the Voorhies Act. passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 21, 1897.

Business the past week has been fairly active notwithstanding the more distant points have laid in the bulk of their winter supplies. It is the prevailing belief that winter stock purchases have not been sufficient to tide over snow-bound places until 1898 spring opening. It is the opinion also that the purchases from other points have been too light which will necessitate constant sorting up. The general tendency of the market is to steadiness with some lines stiffening. The move that is being made by manufacturers and merchants to get cheaper ocean freights from this port looks to be a success, for if older established lines do not give lower freights then competing lines will be established. The low freights from here to points tapped by the Valley Railroad emphasizes the necessity of lower rates. Another move is taking form and that is to get the different transportation companies to give half rate passage twice a year to merchants to visit this city. The Valley Road is the first to come in on that proposition, and it seems quite safe to affirm that others will fall in line. Our manufacturers have had to contend with cheap freight from the East and high inland transportation from here.

The local money market is practically unchanged. The supply of available funds seems to be steadily increasing, notwithstanding the free shipments eastward. Much of that going East is in payment on exchange differences for the gold brought from Australia, which aggregates about $8,000,000 with, it is said, other shipments to follow. There does not appear to be any demand for funds outside of the usual routine of business requirements. Advances made on grain in warehouses have been made mostly by interior banks and capitalists. For speculative purposes the market is dull, but it is stated that the outlook is favorable for an active demand next year. There is a fairly good inquiry for good to gilt-edge bonds—municipal and otherwise. The East reports a fairly active money market, with a better demand for commercial and manufacture paper. A New York exchange says that the country banks were in the market for paper, which shows that the interior is well supplied with funds, but this does not apply to the South, where there is a continued good demand for cotton moving. European advices are rather conflicting, but the trend appears to be to more steadiness. The short crops abroad necessitating heavier importing at higher prices had been the main factor in promoting strong money markets. Gold commands a good premium abroad.

New York Silver Prices.

NEW YORK, Oct. 21.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26¾	57¾
Saturday	27 3-16	58⅝
Monday	27 3-16	58⅝
Tuesday	27 3-16	58⅝
Wednesday	27⅜	59¼
Thursday	27⅛	58⅝

	Copper.	Lead.	Iron.	Tin.
Fri.	11 10 @11 25	4 10	10 00@12 25	13 80
Sat.	11 10 @11 25	4 00	10 00@12 25	13 85
Mon.	11 15 @11 25	3 95	10 00@12 25	13 85
Tue.	11 10 @11 25	3 92½	10 00@12 25	13 85
Wed.	11 10 @11 25	3 95	10 00@12 25	13 85
Thur.	11 10 @11 25	3 95	10 00@12 25	13 85

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.83
London Merchants	$4.81
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	58⅝
Mexican Dollars nominal	46@46½

SILVER.—The markets at the East and abroad held strong throughout the week, with sales up to 59¾ cents per ounce fine at New York and 27⅜ pence in London. The latter price is the highest since last July. The New York *Journal of Commerce* of Saturday, October 16th, reports the market there on Friday, October 15th, as follows: "Bar silver in London was quoted at 27 3-16d, with a scarcity of cash or spot silver. New York market for large commercial silver bars, 50@60c. Fine silver (Government assay), 59⅜@60¼c. The 'official' price was 59c at the close." By referring to prices given above, which are telegraphed to the Merchant's Exchange of this city, it will be seen that the market was higher on that day than reported here. The advance in silver is said to be largely due to a short interest filling and also an active demand for India. If press telegrams are correct that China has negotiated an eighty million dollar loan, then it is quite likely that the country will want more silver next year. The production of silver, it is stated, has been stimulated by improved prices.

MEXICAN DOLLARS.—The market is quiet. Owing to the uncertainty regarding silver, operators in Mexican dollars do not care to anticipate wants.

COPPER.—The market has held steady throughout the week. D. Houston & Co. of New York report as follows in their circular: "The market for copper at this center the past month developed no radical changes, the prominent features being the steady tone and the continuance of the remarkably heavy exports. Home consumption is using up considerable copper without making much show of demonstration. The large mills of the country, however, could undoubtedly consume more copper were they operated up to their maximum capacity of output; but with fundamental business and trade conditions so much improved, a gradual return to increased consumption here is expected. Foreign demand continues to furnish bone and sinew to the market. Exports keep up on a scale of great magnitude, and give conclusive proof of the heavy consumption going on throughout Europe. For the first eight months of this year foreign shipments have absorbed all but 36.7 per cent of the total United States production during this period. The exports this year are 14.3 per cent larger than last year, while the increase in production in this country is only 4.9 per cent."

Our market is quoted as follows:

Ingot casting, jobbing	13	@	—
Ingot " wholesale	12½	@	—
Sheet copper	—	@	16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½		

QUICKSILVER.—The market has held remmarkably steady. There were exported the past week 150 flasks to Mexican ports.

Our market is quoted at $38 for domestic consumption and $34@34.50 for export to the west coast of Mexico.

LEAD.—Our market is reported weak at quotations. The markets at the East sold down under more obtainable supplies and a falling off in the consumptive demand. Unless production is restricted, it looks like still lower prices, for from now on until spring the demand is usually offish.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 25	@	6 50
Pipe	5 50	@	6 00

TIN.—The market for pig has held steady both here and East. Plates are irregular and in buyers' favor.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing		—@	15
Plate, I C coke, heavy, per box	$4 10	@	4 25
" " " light, "	4 00	@	—

SHOT.—The market is easy.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40		
Drop, B and larger sizes, " "	1 65		
Buck, Balls and Chilled, do, " "	1 65		

POWDER.—There is a continued free demand.

COAL.—The market shows more steadiness, with a tendency to more firmness in foreign, owing to lighter supplies on the way.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00	@	—
Greta	6 00	@	6 50
Nanaimo	6 50	@	—
Gilman	5 50	@	—
Seattle	5 50	@	—
Coos Bay	—	@	4 75
Cannel	9 50	@	—

Wallsend	6 75	@	—

TO ARRIVE—CARGO LOTS.

Australian	5 75		
Liverpool Steam	6 75		
Scotch Splint	7 50		
Cardiff	7 50		
Lehigh Lump	12 00		
Cumberland, bulk	10 50		
Egg, hard	9 50		
West Hartley	6 75		

COKE.—The market is quoted as follows:

Gas Companies'	—	—	—
English, to load	—	@	—
" spot, in bulk	10 00	@	—
" in sacks	11 00	@	12 00
Cumberland	—	@	—

IRON.—The market is fairly firm for both foreign and American. The production at the East of pig has increased quite fast. It is now larger than at any time since February, 1896.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

NAILS.—The market is steady.

Wire, carloads, basis per keg			
" jobbing, " "	$2 45		
Cut, carloads, " "			
" jobbing, " "	2 35		

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

Business continues of a jobbing character. While there are no advances by jobbers, yet as stocks of cheap purchases lessen, there seems to be a disposition to strengthen views. At New York, so far as our advices go, the market has exhibited very few changes, and these have been of no material consequence.

A New York correspondent writes: Recent advices from abroad stated that the South American nitrate combination was about to break up owing to outside competition by the Salar del Carmen Company, which refused to join in the agreement. While local receivers of nitrate appear to anticipate such a break it is understood that the combination is still intact and will not be given up until the Salar del Carmen Company actually begins operations, which, according to latest cable advices, it has not yet done.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1¼c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported easy from store at 6¼@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is good for export.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is barely steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Oct. 21, 1897.

The market ruled weak, with a heavy, sick look, up to Tuesday afternoon, when a steadier tone prevailed, which resulted in more active trading at better prices yesterday. At the decline there can be no doubt that many margin accounts were uncovered, while many strong holders sold under the belief that the "jig is up" for this year. So rapid a break from $2.15 to 41 cents a share, as was done by manipulators in Belcher, is enough to demoralize anyone. The advance from about 23 cents to $2.15 was not warranted by any prospects in the mine, and the rapid decline can not be justified by any unfavorable news from the mine, and can only have been done so as to uncover accounts and draw in sellers of more desirable shares. As yet there are not many outsiders dealing; but, at present low prices, it only takes a few to buy large lines, which prevents any contemplated—if there should be any in contemplation—big up move. It looks very much to an outsider as if the market is under strong manipulation for the purpose of getting out long lines of shares for assessment purposes, for the long, wearisome drag, with only small rallies, had cut off a very large majority of outside assessment holders, and, as many companies were accumulating treasury shares, something had to be done to create new interest. The Brunswick lode fiasco did not prove the success looked for, and it would seem as if something had to be done on the Comstock, and therefore the present revival of interest in Crown Point and Belcher. Unless information at hand from these two mines is at fault, it seems a safe proposition to assert that no large development of ore will be made, but there may be enough to encourage holding of shares. If there was any big showing contemplated, Seg. Belcher, on the south of Belcher, and Kentuck, on the north of Crown Point would be selling for considerable more money. The work in several mines on the Comstock points to more interest before long, unless it should be stopped until more favorable times.

From the Comstock mines the news is apparently growing in interest, or, at any rate, attention is being diverted more to them by uninterested parties. Reports are, as usual, conflicting when the share market is under manipulation. Yesterday it was reported that when the 3 o'clock shift in Crown Point came out yesterday afternoon there was an improvement in the mine, but in Belcher the work was a failure. This favorable information caused a buying demand for Crown Point, which spread to both Yellow Jacket and Belcher, but Kentuck lying between Crown Point and Yellow Jacket, as was Seg. Belcher next to Belcher, neglected. It is quite safe to affirm that what is found in the present workings of Crown Point will extend into adjoining mines and be found when desirable. The work under way in Chollar, Potosi and Savage, and one or two of the north end mines is being closely watched by mining men, yet nothing may come of it, as has been the case in years gone by. They are still drifting northwesterly in Utah, with no changes reported. They are raising above the tunnel level in Sierra Nevada, and also pushing ahead on the new tunnel. They raised over thirty tons of low grade ore. They are still running west in crossdrift No. 4 on the 900-foot Union shaft level. At last advices it was in favorable material. In Union they are going south from a raise above the 900-foot level. There is no change in the Mexican workings. All work is confined to the 1000-foot level. Fairly active work is being done in Ophir on both the 1000-foot and old central tunnel levels. As yet nothing of an encouraging character is reported. The 269 tons of reduced, turned out $18 assay values. The concentrates have been sent to this city for reduction by the Selby Smelting and Lead Works.

In Con Virginia work is confined to the 1550-foot, 1650-foot and 1750-foot levels. No changes are reported in the work since our last issue. Last official advices from Best & Belcher and Gould & Curry work had been discontinued from the Bonner shaft so as to make needed repairs. In Savage fairly active work is being done with no material change reported. No work is reported in Hale & Norcross. In Chollar repairing is still being done on the main incline above the 1100-foot level station. In Potosi active work is the order on the tunnel level and also on the 100-foot level. They are saving a fair quantity of fair-grade ore. This quantity, it is expected, will be increased shortly. Nothing comes to hand from Bullion. They are running a northeast drift from the top of the upraise above the 500-foot level in Alpha. In Con. Imperial they are drifting west from the surface tunnel level. In Confidence, Challange and Con. Imperial long distance west crossdrift is still in favorable grounds. From Confidence and Challenge nothing new is reported. There are reports afloat about Yellow Jacket. In Kentuck they are still going west. Advices from Crown Point report active work started towards the recent find. While this is undoubted, grapevine telegrams will be the order to raise and depress the shares. They will soon be in position in Belcher to run for the ore found in Crown Point. They are still cleaning out the north drift on the 1200-foot level. A few tons of ore are raised each week. Nothing new is to be heard from Seg. Belcher, Overman, Alta or Justice.

From the Brunswick lode our advices report active work in Occidental, Chollar, Savage and jointly in Gould & Curry, Best & Belcher and Con. Virginia. The work in all of the mines is practically unchanged, being about of the same character reported last week. There are miners who look for good results but it may take more time than is now expected by them.

The market opened weak this morning, with fair sales reported. After regular call it strengthened, with Sierra Nevada selling up. At the 2:30 session the market was lower, under a raid on Belcher, Crown Point and Yellow Jacket. The seller hardly waited for bids, but sold until about 1000 shares of each were placed. Other sellers helped to swell the aggregate. It looks more than ever like manipulation for shares—uncovering margins and scaring others into selling.

They expect to be into the ore in Crown Point within two or three days. There is better news from Justice. They ran into 4 feet of ore where none was looked for, which looks very encouraging. In Kentuck no work is being done, but a proposition is being discussed to wait until Crown Point runs a west crossdrift in its ground for the ore, and Yel-

Yellow Jacket	73	55

Under date of October 15, J. A. Pollock of Salt Lake, Utah, says:

With a few exceptions, stocks in both sections were fairly well sustained during the week. The volume of business was somewhat in excess of that recorded last week and with a still increased betterment, even should it not be great, prices would be materially advanced. This is usually the season of low prices, even under normal conditions, and stocks purchased at this time of the year have heretofore nearly always given very good results. The gold stocks, especially the dividend payers, appeal strongly to investors as good purchases.

Next week the annual meeting of the Ajax will occur. Some very high grade ore is being broken at the mines. Alice has declared a dividend of 5 cents, or $20,000. Anchor was slightly stronger, on the strength of the continued good showing. On very light business, the quotations on Bullion-Beck held at about last week's figures. It is intimated from inside sources that operations at the mines will soon be resumed. A slight weakening in Buckeye followed the recent sharp advance, but offerings were not heavy and quotations did not suffer seriously.

The night force at the Centennial-Eureka was laid off on Monday, in keeping with the management's policy of curtailment of ore extraction. At the mines the showing is reported to be very fine, especially on the 800, 900 and 1000-foot levels. Little was done in the stock. Somewhat better prices were made on Chloride Point. Work on the mill is progressing favorably. The Dalys were again inactive and last week's figures ruled nominally. Daly is now selling at a price that does not give the capital stock a total value as great as the amount of cash reported to be in the treasury, to say nothing of the mines and great surface improvements. An assessment of ½ cent per share has been levied on Dalton. Dexter was fairly active, but at unchanged figures. The new mill is going in. Dalton & Lark was inactive. Four Aces has just held its special meeting. The stock sold slightly lower again.

Geyser-Marion was in good demand for investment account, with prices fluctuating each way slightly. The October earnings are showing up in a highly satisfactory manner. The properties are in excellent condition and both mills are doing well. Mr. John Dern was to-day elected general manager, and E. H. Airis, also of the Mercur Company, was selected as treasurer. No action as to this month's dividend has yet been taken.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 12, 1897.

591,583.—ENGINE REGULATOR—Barbour & Hansen, S. F.

591,584.—AIR COMPRESSING ENGINE—Barbour & Hansen, S. F.

591,375.—RELIEF VALVE—J. H. Beare, Stockton, Cal.

591,587.—AMALGAMATOR—W. L. Brown, S. F.

591,778.—BOTTLE—Donahue & Leach, Los Angeles, Cal.

591,646.—BOOT—F. Ephraim, S. F.

591,753.—OBTAINING PRECIOUS METALS—E. J. Fraser, S. F.

591,629.—ENGINE—H. B. Gale, S. F.

591,698.—IGNITER—M. O. Godding, Monrovia, Cal.

591,471.—CIGARETTE HOLDER—G. Hara, San Mateo, Cal.

591,604.—ALLOY—C. F. Hitchcock, S. F.

591,409.—HEAT INSULATOR—J. Lumley, S. F.

591,772.—ROOF BRACKET—J. Matter, Lincoln, Cal.

591,676.—PLOW—F. Moore, Hanford, Cal.

591,787.—BICYCLE TIRE—J. D. Parker, San Diego, Cal.

591,425.—LUGGAGE CARRIER—J. H. Quinton, San Diego, Cal.

591,642.—POTATO DIGGER—J. Schwartz, Portland, Ogn.

591,701.—BRAKE—H. S. Smith, San Jose, Cal.

591,509.—OAR LOCK—J. R. Supple, San Diego, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

DELINQUENT SALE NOTICE.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 3rd day of August, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Caroline S. Townsend	18	20	180 00

And in accordance with law, and an order from the Board of Directors, made on the 25th day of August, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 125 Beale Street, San Francisco, California, on SATURDAY, the 23rd day of October, 1897, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale Street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to SATURDAY, November 6th, 1897, at the hour of 1 o'clock P. M., at the office of the company, 125 Beale St., San Francisco, Cal.

H. H. MARTIN, Secretary.

Assessment Notices.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 28th day of September, 1897, an assessment (No. 8) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 44 Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44 Phelan Building, San Francisco, California.

NOTICE OF SPECIAL MEETING

OF THE

STOCKHOLDERS OF THE

SUNOL LAND AND IMPROVEMENT COMPANY.

Notice is Hereby Given that a Special Meeting of the Stockholders of the Sunol Land and Improvement Company, a Corporation, is hereby called and will be held at the office of the Company, at 240 Second St., in the City and County of San Francisco, California, at the hour of 4 o'clock P. M. of the 26th day of October, 1897. The object of such meeting is the election of a Board of Directors of said Corporation, to serve and act as such until the next annual meeting of the Stockholders of said Company, or until their successors are duly elected and qualified. The said meeting has been called by the order of Stockholders holding more than one-half of the votes of the Corporation, to-wit: W. J. Wiley, Thos. Alton, C. B. Stone.

Dated San Francisco, California, October 8th, A. D. 1897. C. B. STONE, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Sam Ahtye, in the Emerton mine, near Gibsonville, Sierra Co., to deposit tailings in Slate creek, and in the Doherty mine, near Table Rock, Sierra Co., to deposit tailings in Slate creek; from Victor Montre, in the Grizzly Canyon mine, near Pike City, Sierra Co., to deposit tailings in Grizzly canyon; from B. F. Atkinson, in the Homestake mine, No. 2, near Sierra City, Sierra Co., to deposit tailings in the impounding basin of the Homestake mine, and from C. R. Scott, et als., in the Gold Nugget mine near Gibsonville, Sierra Co., to deposit tailings in Canon creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on October 25, 1897, at 1:30 P. M.

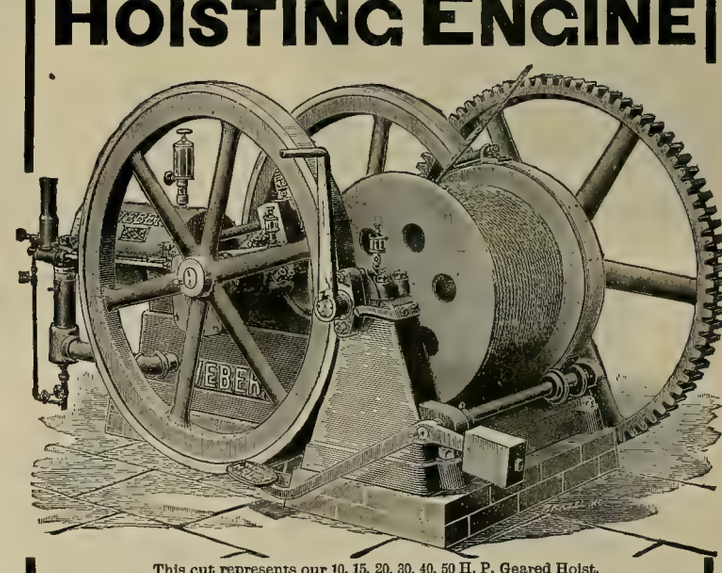
Cordez, in the Mosquito Mine near Comptonville, Yuba Co., to deposit tailings in a ravine; and from C. N. Foote, in the Montalgo Mine near Uno, El Dorado Co., to deposit tailings in Cedar Creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 8, 1897, at 1:30 P. M.

WEBER GASOLINE HOISTING ENGINE

MONEY SAVERS

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.



This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

We also build **Single and Double Drum** Hoisting Engines, both **Geared or Friction,** and furnish Wire Rope, Ore Buckets, Cars, Shives, etc., making complete outfits. "Weber" Hoisters and Engines use **Gasoline, Naptha, Distillate, etc.,** for fuel. They can be used **Underground** or on the dump. **Altitude** makes no difference in the operating of the "Weber."

SAFE, STIFF, STRONG.

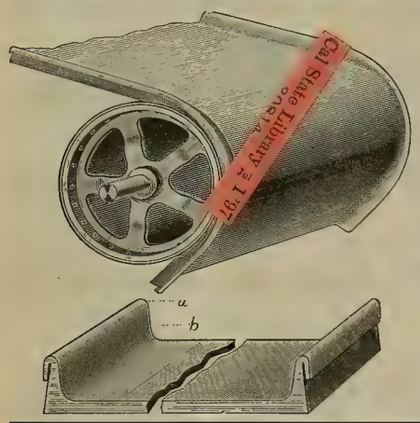
Every Engine sold on an Absolute Guarantee. In use for all purposes. Used by such concerns as K. C. Consolidated Smelting & Refining Co., Philadelphia Smelting Co., Guggenheims, etc.

For prices and particulars, write us, stating duty required, Horse Power, etc. Catalogues, "Stationary" and "Hoisting" on application to

WEBER GAS AND GASOLINE ENGINE CO. 430 S. W. Boulevard.

KANSAS CITY, MO.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintendent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.

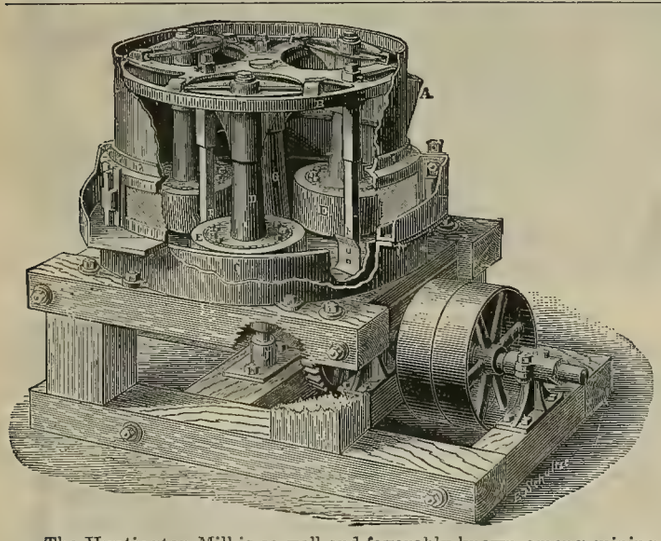
Room 610, 330 MARKET ST., - - - SAN FRANCISCO, CAL.



The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

The Chicago Drainage Canal.

At a recent meeting of the American Institute of Mining Engineers in Chicago, J. F. Lewis of that city read a paper on the inception and progress of the Chicago drainage canal, the greatest engineering work of recent years in the United States, and one that presents several points of interest to mining engineers. The Chicago Drainage Board, organized December 8, 1891. To carry out the plan of the engineering department, it was necessary to divert the Desplaines river, by cutting a channel 200 feet wide and 4 feet deep. On June 8, 1892, bids were opened; work on the canal was commenced September 3, 1892.

The total length of the Chicago drainage canal, 28.05 miles, is divided into twenty-nine sections; fourteen of them practically all in earth or glacial drift; six in glacial drift and rock; and nine all in rock. There are five sections which exceed a mile in length each.

The dimensions are: for 14.9 miles through the rock cut, 160 feet wide at bottom, 162 feet wide at top; and in the glacial drift for 13.15 miles, 202 feet wide at bottom, and 290 feet at the water line when the channel is carrying 22 feet of water. The channel at the junction of the Chicago river is 24.45 feet below datum; at the Lockport end, 30.1 feet below datum.

The excavation of glacial drift has been 28,059,488 cubic yards; of rock, 12,243,416 cubic yards; total excavation, 40,402,804 cubic yards. There are 371,969 cubic yards of retaining wall. The average contract price was 76.3 cents per cubic yard for rock; 28.9 cents for glacial drift; for all retaining wall on the canal, $3.27 per cubic yard. The cost of machinery and equipment was about $2,750,000; the greatest number of employes, 8500; the consumption of explosives, about 10,000,000 pounds. The maximum work excavated in one month was as follows: Glacial drift, 555,737 cubic yards; solid rock, 120,780 cubic yards. Of retaining wall there were built 45,380 cubic yards, at an aggregate price of $403,464.92.

FIG. 1.—COMPLETED ROCK CUT, CHICAGO DRAINAGE CANAL.

The entire cost of the work is approximately $30,000,000. Besides being a drainage channel for the 887.321 miles of Chicago's sewers, it will also be a ship canal for vessels drawing less than 22 feet.

Fig. 1 is of a completed rock cut on section 8; the span is 700 feet long, showing, in part, the manner of moving the blasted material. The cable-way illustrated had a daily capacity of 600 cubic yards. About twenty such devices were in use. Mining engineers are of course familiar with the use of cableways, but it is believed their use in canal making is a new feature. The kind illustrated cost $14,000 each.

Fig. 2 shows the manner of building the retaining walls, the machines for which were of a type of combination stone-crusher and cement-mixer, which crushed the stone, mixed the sand, cement, crushed stone and water, and delivered it to the wall cast, the machines moving on tracks along the berm. The average height of the wall is eighteen feet.

The discharge from the drainage canal leading into the Desplaines river is controlled by sluice gates, of riveted steel, weighing each fifteen tons, and a bear-trap dam.

The enormous work was simultaneously carried on, with little delay, and the great amount of money was disbursed honestly and economically by the Chicago officials in charge.

FIG. 2.—BUILDING RETAINING WALLS, CHICAGO DRAINAGE CANAL.

The Mining Engineer.

In some recent remarks by Henry A. Gordon on the subject of "Mining Engineers," he says it is essential that a mining engineer should have, in addition to the practical experience in working mines, a technical training and a knowledge of the sciences on which mining is based—geology, mineralogy, chemistry, metallurgy, mechanics and mine surveying.

While it is essential to have a technical education, it must not be supposed that this is the only requirement. Mining cannot be termed an exact science, but is an industrial art or occupation for purely economic purposes. A mining engineer's success is judged from a financial aspect; economy and results are the criterions by which he must stand or fall. Unless he can carry on large operations more economically and get better results than a man without any technical education, then his training has been of no value either to himself or his employers. Mining is based on scientific principles. The treatment of the ore after it leaves the mine is a subject which requires considerable scientific knowledge in order to secure the highest percentage of its contents with the greatest economy. A mining engineer may have high theoretical attainments and yet fail from lack of practical qualities for conducting mining operations. Mr. Knopp, a mining engineer recently engaged by the Government of British Columbia to report on the mines in that province, in his report to the Minister, as taken from the blue-books of that colony, says: "If you wish to employ a mine manager get one from the Pacific Slope who has cost a company half a million dollars. That man may make slight mistakes again, but other companies have paid for him gaining his experience. The manager of a mine should be able to run an engine, know how to run a mill in all its branches, know when each stamp is doing its duty, detect a loose mortar-hole, cut out any timber for a shaft or drive or elsewhere, sharpen a pick or drill; in fact, he must be a miniature encyclopædia."

Some knowledge of geology is necessary to understand the formation of different rocks met with in mining, how faults occur, and the effect these have on lode displacement. In different parts of the world certain metals are found in certain formations, and although not the same in different countries where the same metals and minerals are found, yet have a geological relation to each other which enables a geologist to form an idea as to the metals and minerals likely to be obtained in the different rocks in the country under his examination. Mineralogy and crystallography also deserve more attention than is generally given to them. A general knowledge of these sciences enables the engineer to recognize the mineral he meets with, while his knowledge of chemistry assists him in determining its parts and value. A mining engineer has, in the constant practice of his profession, to make or get assays made of the different ores in the mine under his superintendence. It is necessary that he should have a theoretical knowledge of chemistry and have been sufficiently in a laboratory to become proficient in qualitative and quantitative analysis and assaying. Without a knowledge of chemistry he cannot understand the principles of metallurgy and the reasons why different classes of ore require different modes of treatment. There is no subject at the present day that demands more attention than the intelligent treatment of ores.

A knowledge of surveying and leveling is also indispensable to a mining engineer. He should be able to make accurate underground surveys, and understand the principles of construction of all works in connection with every branch of mining, and the machinery and appliances connected therewith. It is impossible to acquire this knowledge solely from theroetical training. The mining engineer must have had practical experience in the different systems of working mines, and this can be got neither from lectures nor from literature. Mining must be learnt in a mine, and, even although a man may have a good practical knowledge of quartz mining, he may have very little knowledge of hydraulic or other forms of mining. Hydraulic mining, although apparently simple, requires the man who superintends operations to have a good deal of practical experience to carry on the operations successfully with the greatest economy. The desideratum of the profession is to have men qualified in every particular to carry on mining operations successfully at a minimum cost.

The education of a mining engineer in following his profession is continually proceeding; he is learning every year of his life something new; scarcely a day passes without bringing with it some fresh subject for investigation. The number of questions he is supposed to be able to solve is perplexing—questions which a mining engineer is expected to answer every day of his life, unless he chooses to shut himself up so that nobody can see him.

It is essential that a mining engineer should have a knowledge of the geological structure of the rocks in the district where he is to conduct mining operations, and that he should make a study of the ore deposits—a subject which is too often lost sight of by those engaged in mining.

An engineer may develop a mining property successfully by simply following the ore bodies, guided by empirical rules which experience has taught him, without regard to the phenomenal appearance of the country rock, its structure, condition, or the probable origin, character, and formation of the ore deposits; but in carrying on his operations it is to be expected that unless he carefully studies this subject he will be liable to make mistakes which may involve a large useless expenditure.

Railway Statistics.

The ninth statistical report of the Interstate Commerce Commission, prepared by its statistician—being the complete report for the year ending June 30, '96,—has just been issued. The total railway mileage in the United States on June 30, 1896, was 182,776.63 miles, an increase of 2,119.16 miles, or 1.17 per cent during the year. California shows an increase of 202.05 miles, next to Georgia the greatest increase of any of the forty-five States. The aggregate length of railway mileage, including all tracks, on June 30, 1896, was 240,129.12 miles. The total number of locomotives in service on June 30, 1896, was 35,950, or 251 more than on the same date of the preceding year. Of this number 9943 were passenger locomotives, 20,351 were freight locomotives, 5161 were switching locomotives, 495 unclassified.

From summaries in the report indicating the density of equipment and its efficiency in the transportation of passengers and freight, it appears that the railways in the United States employ 20 locomotives and 713 cars per 100 miles of line. Referring to the country at large, it is shown that 51,471 passengers were carried and 1,312,381 passenger-miles accomplished per passenger locomotive. It is also shown that 37,634 tons of freight were carried and 4,684,210 ton-miles accomplished per freight locomotive.

The number of men employed by the railways of the United States on June 30, 1896, shows an increase of 41,586, being 826,620, which, assigned on a mileage basis, gives 454 men per 100 miles of line.

For the first time, a summary showing the amount of compensation paid to the several classes of railway employees is presented in this report. It includes the compensation of over 99 per cent of the employees for 1895 and 1896. The aggregate amount of money paid in wages and salaries, as shown in the summary for the year ending June 30, 1896, was $468,824,531, or 60.65 per cent of the total operating expenses of railways.

The amount of railway capital on June 30, 1896, was $10,566,865,771, which assigned on a mileage basis, shows a capital of $59,610 per mile of line. It should be noted, however, that these figures do not include current liabilities, which, if included as a part of capital, as in former years, would increase the amount of outstanding capital about $613,000,000, making the amount per mile of line $63,068.

The total amount of dividends was $87,603,371, which would be produced by an average of 5 62 per cent on the amount of stock on which some dividend was declared.

The number of passengers carried during the year ending June 30, 1896, was 511,772,737, an increase of 4,351,375 as compared with the year ending June 30, 1895. That year, however, showed a decrease of 33,266,837 as compared with 1894. The number of tons of freight carried during the year under consideration was 765,891,385. This is the largest tonnage ever reported for railways in the United States. The increase during the year was 69,130,214. The number of tons of freight carried one mile was 95,328,360,278, there being an increase of 10,100,844,387. The density of freight traffic is shown by the number of tons of freight carried one mile per mile of line, which was 523,832. These figures, as compared with those of the preceding year, show an increase of 44,342 ton-miles per mile of line.

The gross earnings of the railways of the United States for the year ending June 30, 1896, were $1,150,169,376, having increased in comparison with the previous year $74,797,914. The sources of the income comprised in gross earnings from operation during the year were: Passenger revenue, $266,562,533; mail, $32,379,819; express, $24,880,383; other earnings, passenger service, $6,691,279; freight revenue, $786,615,837; other earnings, freight service, $3,885,890; unclassified, $579,398. The expenses of operation for the year covered by the report were $772,989,044, being greater by $47,268,629 than the preceding year. The operating expenses were assigned as follows: Maintenance of way and structures, $160,344,950; maintenance of equipment, $133,381,998; conducting transportation, $442,217,582; general expenses, $36,083,285; unclassified, $961,229.

The income from operation, that is, the amount of gross earnings remaining after the deduction of operating expenses, was $377,180,332, which exceeds the corresponding item for 1895 by $27,529,285. The income from other sources, mainly from leases and investments, was $129,024,731, which, added to the income from operation, makes a total income of $506,205,063. The total deductions from income were $416,573,137, so that the net income out of which dividends and surplus were declared was $89,631,926. The dividends declared were $87,603,371, leaving a surplus of $1,534,169, after the satisfaction of adjustment claims amounting to $494,386. This small amount of surplus, however, shows an improvement, since the results of railway operations during the years 1895 and 1894 showed deficits of $29,845,241 and $45,851,294, respectively.

An analysis of the total deductions from income, $416,573,137, shows that they were composed of the following items: Salaries and maintenance of organization, $545,468; interest on funded debt, $249,624,177; interest on interest-bearing current liabilities, $8,469,063; rents paid for lease of road, $92,972,322; taxes, $39,970,791; permanent improvements, $5,162,240; other deductions, $19,829,076.

The number of railway employees killed during the year ending June 30, 1896, was 1861; number injured, 29,969. The number of passengers killed was 181; the number of passengers injured, 2873. The number of persons other than employees and passengers killed was 4406; and the number injured, 5845. These figures include casualities to persons reported as trespassers, of whom 3811 were killed and 4468 were injured.

In the conclusion of his report the statistician repeats the recommendations contained in previous reports, to the effect that reports should be secured from express companies engaged in interstate traffic; that reports should be secured from corporations and companies owning rolling stock which is used in interstate traffic, and special reports from corporations and companies owning depot property, elevators, and the like; and that reports should be secured from carriers by water, so far as their business is interstate traffic.

Concentrates.

THE California State Debris Commissioner at present has no secretary.

THE Le Roi smelter at Northport, Wash., will begin operations Dec. 29, '97.

GEORGETOWN, El Dorado Co., Cal., has organized a branch miners' association.

COLORADO figures a total mineral output aggregating a value of $40,000,000 in '97.

THE Mount Morgan, Australia, mine in August treated 12,732 tons of ore for 13,533 ounces of gold.

A CHINESE "mining expert" is reported experting mines in Nevada county, Cal., for a Chinese company.

THE Randsburg, Cal., *Miner* says the automatic dry concentrator recently tested there is a success.

COMMISSIONER OF THE LAND OFFICE HERMANN has ruled that an Alaska Indian may take up a mining claim.

THE Salt Lake *Tribune* suggests that the tariff on lead be made a political issue. Free lead vs. free silver.

AUSTRALIA will add its quota to the rush of gold hunters to the Klondike next year. Several hundred will sail from Sydney.

NEW MEXICO papers say there is an urgent demand for the diamond drill in that Territory, especially in the Cochiti mining district.

KILPATRICK BROS. are reported to be operating a coal mine at New Castle, Wyo., "the coal from which carries $4 to the ton in gold."

THE next meeting of the California Debris Commission to hear applications for permits to resume hydraulic mining will be on November 8th.

THE electric plant recently put up at Cottonwood, Churchill county, Nev., is reported to be successfully working the nickel ores of that district.

THERE has been a change in the Canadian customs laws and miners are permitted to take in an outfit, free of duty, when not exceeding $100 in value.

SINKING began this week on the twenty-second level of the Empire mine, Grass Valley, Cal. A new ore chute has been struck on the 2000-foot level.

AT Austin, Nev., the Austin Mining Co. say they want fifty competent miners, "first come, first served." About 150 men are employed at present.

BEGINNING next Monday, shipments of refined bullion from the De LaMar—Nevada's biggest mine—cease. Hereafter it will go out in the form of a cyanide.

DURING the first half of the present year 9335 mining claims were "patented" in Mexico. During the same months in '98 the number of patents was only 241.

THE possession of a United States patent to land, agricultural or otherwise, precludes any attempt to "prospect" thereon against the wishes of the owner.

BESIDES being honest it is more materially satisfactory in the long run—or the short run—to defer the sale of any mining stock till the title to the ground is perfected.

THE number of Klondike and Yukon companies organized in London is increasing. Up to the 18th inst. thirty had registered with capitals ranging from £7000 to £25,000.

IT is estimated that over eighty tons of diamonds have been unearthed in the South African fields during the last eighteen years. These represent a total value of £56,000,000.

THE narrowest gauge railway known to the writer is the 20-inch road of the Arizona Copper Company, at Clifton, Arizona, on which a 17-ton engine runs on a 24-pound per yard rail.

THERE is no limit to the number of mining claims an individual or corporation may take up, but there is a limit to the number that can be worked, and that limit should not be exceeded.

PEGAMOID, for rendering asbestos, paper, etc., impermeable and proof against acids and grease, is a liquid made by dissolving celluloid in alcohol. On applying, the alcohol is driven off by heat.

THE Colorado *Mining Review* says: "California is keeping even pace with Colorado in its increasing gold production, and when the year's results are known it will probably be found as usual in the lead."

THE old base metal district of Eureka, Nevada, now claims that development work will show abundant bodies of high-grade gold ore. 'Twould be singular if "Charcoal Flat" should turn into a gold camp.

AGREEMENT has been made by the New Zealand minister of mines and the Cassel Gold Extracting Company, by which the company agree to sell the patent rights within that colony to the Government for £15,000.

A DISPATCH from Kingman, Arizona, announces that the largest mining deal ever transacted in Mojave county has been consummated in the sale of the Minnesota and Connor mines to Thomas Ewing of Oakland, Cal., for $250,000 spot cash.

THE Bonanza gold mine of South Africa produced 8031 ounces of gold in September; the management declared a dividend of 50 per cent, payable to-day. The Crown Reef mine produced 12,909 ounces of gold in September at a profit of £22,958.

THE London *Statist* says that in the current year Russia's purchases of silver in connection with its arrangements for a return to a metallic currency have amounted to $25,000,000 in value, about one-fourth of the world's total production of silver for that period.

PROBABLY the wettest mine in Colorado, says the Denver *Mining Industry and Review*, is the Free Silver at Aspen. It is said to flow 2800 gallons per minute. This is equal to almost 4,000,000 gallons in twenty-four hours—enough to supply a city of 40,000 people.

AUSTRALIAN gold still pours toward San Francisco. The Mariposa, now on the way, has $1,350,000 for this port, making a total of $7,000,000 from Australia during the last six months. It is found cheaper to send gold direct to San Francisco than via London and New York.

LONDON mining papers call attention to the production of the Witwatersrand, South Africa, mines for the year and say: "There is absolutely no reason, political or economic, for the present fidgety and feeble state of the South African market. For the producing mines the year has been a record one, the output of gold having far exceeded that of the boom year."

WRITING from Sinaloa, Mexico, a subscriber says: "The Mexican method of working a gold mine simply prevents ever ascertaining the true value of the property; therefore, unless the development of a property is under the management of a foreign company, it is not known whether it is a producing mine or not." The same criticism applies largely to California.

WHAT is believed to be the best information regarding the Klondike appeared in three articles written for this journal by specialists, in the issue of Aug. 7, '97. The demand was so great that a reprint of the entire edition was exhausted. Nearly all the subsequent pamphlet information regarding that region has been copied from the issue of this paper of that date.

INCREASED activity in mining in California has caused the revival of railway and telephone projects all over the State, several of which are materializing. It is now possible to talk from San Diego to Redding, 906 miles, and the telephone lines are extending to remote mining districts. The narrow-gauge railways building and in embryo will go far toward solving the transportation problem in the foothills and mountains.

THE San Giuseppe mine, adjoining Sonora, Tuolumne county, Cal., according to the *Democrat*, has yielded the purest gold ever mined, either quartz or placer. Gold 1000 fine, chemically pure, is worth $20.67 per ounce. That from the San Giuseppe has an average fineness of 985, "while selected specimens of the virgin metal just as they came from the rock have reached 988⅔, worth per ounce within a slight fraction of $20.44."

SOME Nevada holders of unpatented silver claims say it is hardly worth while doing the annual work in '97 required to hold them. Where claims represent a past outlay of money the question is a difficult one. But sixty-one days remain, and, if possible, every holder of any mining claim anywhere should do sufficient work to legally hold it. Now and for the next few years no property equals in prospective value a mining claim.

SOME TIME ago was reported a mine in Bingham, Utah, where the sulphurets were on the surface and gave way to free gold as depth was attained. Now comes a statement that in the Socorro mine, eighty miles northwest of Phœnix, Arizona, samples of galena ore, lead sulphides, carry free gold. It may be so; since gold was found in coal in Utah, and in the bark of trees in Washington and hen's gizzards in Oregon, no statement is to be accounted incredible.

"MINING is a risk." What in life isn't a "risk"? Mercantile pursuits, manufacturing enterprises, business propositions of all kinds involve big risks. The slightest movement is a "risk." To eat or drink or travel is a "risk." The farmer is the riskiest one of all. He bets on the rain and the European markets; on the weather six months ahead, and the likely demand for his crop; yet men are not dissuaded from any ordinary pursuit of life by the element of "risk." They rather like it.

THE shareholders in the Wonderful Group Mining Company, Slocan district, B. C., object to the development that there was no money in the company's treasury and no ledge in the company's mine. Manager Field tells them that he has been unable to find any ledge; that a further small expenditure might result in its discovery, but again it might not. Since the Wonderful Company took the property over, $39,133 was realized through the sale of float washed out of the side hill and $49,554 was spent. Among the disbursements is an item of $5000 paid for the mine.

THE Register and Receiver of the land office at Redding, Cal., has a ruling regarding the title to mineral lands—the case known as the Mineral Affiants and Protestants vs. the C. P. R. R. Co.; the hearing was had June 14th. According to the ruling all land claimed by miners who appeared at the land office was conceded as mineral. "Those who did not appear at the land office in person or by attorney are allowed thirty days from October 11th within which to appeal from the decision, and if not appealed within that time the decision will become final as to all question of fact."

THE cost of cyaniding varies largely with the character of the ore. There are a number of mills which crush and cyanide ore for less than $2 a ton, exclusive of royalty paid to the company owning the patents. The lowest cost recently reported in this country is 85 cents a ton, at the Mercur, Utah. No company has yet been able to reduce the cost of treating tailings to the minimum reached in South Africa—59 cents per ton; but one plant, operating under exceptionally favorable conditions, is working at a cost of 69 cents a ton. In general, the tailing plants working in this country do not obtain a high extraction.

WHEN the gold standard was established in Japan the authorities did not think it necessary to provide against a return for redemption of the Japanese silver yen in circulation in China and the Straits. The Japanese Government did not expect the decline in silver, which has given Chinese holders an opportunity to return Japanese silver to Japan for redemption, making a profit thereby. These Japanese silver yen are being returned to Japan for redemption in gold at their face value, thus accumulating a good deal of silver in this form, and may be obliged to dispose of it for what it will bring in the market.

STEAMERS from St. Michaels bring men who failed to reach the Klondike but who saw and heard enough to confirm the warnings of this paper in the earlier months of the year that death in its most ghastly form awaited those who started for that region without thorough equipment. As for "news" from there, little worth publishing can be added to what has already appeared herein. The articles on the Klondike originally published in these columns have been reproduced in every part of the earth, and while accurately stating facts, have contributed in some degree to inducing sober thought on the part of those inclined to fling away all judgment in the mad rush.

"IS CYANOGEN capable of dissolving gold?" is a question asked and answered by Mr. Skey of Wellington, N. Z., who says that cyanogen as used in cyaniding would have but very little tendency to form, by its decomposition, products that are solvents of gold; that cyanogen can never be profitably used for the alternative to an alkaline cyanide as proposed or patented by the patentees of the cyanide process; that cyanogen is not the solvent, but that an alkali is just as necessary for it as the gas. If first cyanodized, a partial decomposition of the cyanide used takes place, but this cyanide or oxide of gold thus formed, being insoluble in water, requires an alkaline cyanide to bring it into solution for its subsequent extraction, which it does by forming the salt, auro-cyanide of potassium; and that free cyanogen is practically unable to bring gold into solution.

"CONCENTRATES" is reminded by an Aspen, Colo., subscriber that the flashlight signals used by a Butte, Mont., mining superintendent, and noticed in the issue of the 16th inst., are an old thing so far as Aspen miners are concerned. Very likely; nearly all the new devices noted have been in use somewhere, some time, by somebody. The same mail brought a letter from San Bernardino, Cal., regarding the "novel" scheme of irrigating land by water from a mining shaft there. "Concentrates" remembers doing the same thing twenty-three years ago in Lincoln Co., Nevada. Doubtless the tin miners of Phœnicia did the same thing twenty-three centuries agone. In the days of old Rameses these "new" things had paresis.

FROM an article in the *Eisenzeitung* on the output of platinum in Russia is taken the following notes: The Russian production of platinum is forty times greater than that of all other lands together. In Russia it is found exclusively in the southern Oural region. It is shipped in its crude state to Germany and there refined. (This statement is surprising, as it has been commonly supposed that most, at least, of the Russian platinum is worked up by Johnson, Matthey & Co. of London.) The output in 1895 was 4413 kilos as against 2946 kilos in 1880. The cost of crude platinum in Russia is at present about $216 per kilo. The amount of iridium found with the platinum is very small, being in 1895 only 4.1 kilos, in 1894 only slightly more than this.

THE use of sodium dioxide in connection with cyanide is the chief element in the Kendall process. Prof. Kendall says that the better results are obtained by adding the freshly-made solution of dioxide to the cyanide solution; some chemists claim that much oxygen is lost in this way, which is made available when the dioxide is mixed, dry, with the ore. The object of the dioxide is to furnish nascent oxygen, which acts on the cyanide to liberate cyanogen, hastening the reaction. Partial experience with the use of dioxide has been that, in general, a greater extraction is obtained in a short time (twenty-four to forty-eight hours); and that at the end of a long time (seventy-two to one hundred and twenty hours) the extraction with dioxide is about the same as with cyanide alone.

TO ASCERTAIN where the loss in sulphurets occurs, a good way is to pass one of 10,000-grain samples through a 60-mesh wire screen; weigh that which passes through and that which remains on the screen, and pan out each lot carefully by itself, from one pan into another, as long as the sulphurets can be recovered; then weigh each batch separately. The use of 10,000 grains is recommended, as every 100 grains is 1% and each grain is 1-100 of 1%. It is also a convenient size for obtaining accurate results. By using pulp samples instead of tailings, the amount of sulphurets in the ore may be ascertained. If the sulphurets assay $75 per ton, and the quantity per ton is 1.7%, the value of the sulphurets in one ton of ore is found by multiplying $75 by 0.017, which would be $1.27 per ton. If the loss of sulphurets in the tailings is 11 grains out of the 10,000-grain sample, and the value of the sulphurets is $75 per ton, then multiply $75 by 0.0011, and the value of sulphurets in the tailings is found to be $0.0825 (8¼ cents) per ton of tailings.

SPEAKING of the cost of producing copper and its bearing upon the future of the copper market, a mine official says: "In my opinion it will be impossible to much further reduce the cost of mining copper. The system now has reached an almost perfect state, and experiments which have been made recently with a view to still further reducing the cost of mining, by using higher explosives, have proved valueless. We have tried high explosives, but find that the results are far from satisfactory as compared with lower grade explosives, inasmuch as a smaller quantity of rock is displaced by the higher grades, than by the lower grades. The force of the high-grade explosives, undoubtedly, is much greater, but is expended so quickly that it does not perform as much work as do the low-grade explosives. If the cost of electrical power could be cheapened, it would make considerable difference to mines like the Tamarack, for instance, where a vertical shaft is sunk, say 5,000 feet, then changed to follow the incline of the lode. The danger from fire and the physical and mechanical difficulties are too great to install a steam plant a mile under ground, and compressed air cannot be used for hoisting from great depths. Possibly the future may develop a cheaper electrical power, but, until it does, the cost of mining copper, or of handling a ton of rock, will not be materially reduced from present figures."

THERE is considerable diversity of opinion among mine owners as to the time they should allow on mine bonds, but there is a tendency to give less time than formerly, owing to the objection of tying up the property to people who may, after all, do nothing with it. This objection to long time depends, however, on the individuals who bond. If they only tie up the claim hoping to make a commission on a sale, and then fail to dispose of it, the shorter time given them the better, though they always want six months or a year in which to carry on their negotiations. When a claim is, however, bonded to a company, who are to develop it and become the possible purchasers themselves in the event of success, they need considerable to prove the worth of the property. A provision enforcing "continuous work" is a good remedy in this case, since if they stop, the claim reverts to the original owner without the loss of too much. Those who intend negotiating "deals" complain that sixty or ninety days time is too short to carry one through, while the mine owners do not like to tie up their property too long. Long and easy termed bonds of course give plenty of time for investigation and examination, but are not always fair to the original owners. It is not unusual to give one, two or three years time or lease, where companies obligate themselves to develop the claim during the period. But people who bond only to sell should not be given any such time. In fact, six months, at furthest, is plenty of time for such an operation, and unless it is to be abroad, ninety days should suffice in most instances. Hawking a mine about from one to another does it no good, and it is for this reason many large owners decline to bond at all, though they may sell at a stipulated price agreed upon. Owners of small mines often bond them for long periods without knowing much about the men with whom they negotiate, and are thus prevented from making a sale themselves, even after the other party has failed to do so. It is proper therefore, to inquire carefully into the standing and the intention of those who wish to bond mine properties.

Notices and Certificates of Locations.

In response to some inquiries regarding correct forms for notices and certificates of location under the recent California enactment, the following are published, and are believed to fill all necessary requirements. It is of course unnecessary to say that the descriptions are all fictitious. These notices have been prepared by a prominent mining lawyer, and their importance, as they constitute the basis of the miner's title to the ground, justifies the prominence herein given them. Particular attention is invited to the necessity for properly describing the claims located with reference to natural objects and permanent monuments, and likewise to the proper marking of the location made on the ground at the time of location:

Preliminary Notice of Lode Location—Under Act of March 27, 1897.—Notice is hereby given that I, John Williams, a citizen of the United States, have discovered a vein of rock in place carrying gold, silver, and other valuable deposits, upon which I have erected a discovery monument and posted this notice, as hereinafter set forth:

That in accordance with the provisions of title thirty-two, chapter six, of the Revised Statutes of the United States, and the laws of the State of California, I hereby claim fifteen hundred linear feet of said vein, measured as hereinafter set forth.

Said discovery was made on the 29th day of May, 1897. Immediately upon making the same, and on said May 29, 1897, I erected at the point of discovery a substantial monument and mound of rocks, and posted thereon this notice.

The general course of said vein is north and south. I claim in length thereon five hundred feet northerly and one thousand feet southerly from said discovery monument. I also claim three hundred feet on each side of the center of the vein.

This vein or claim shall be known as and called the "Elizabeth." It is situated in Jackson mining district, Amador county, California, in section 20, township 6 north, range 11 east, Mount Diablo meridian, the discovery monument being placed four hundred feet westerly from the point where the Jackson and Volcano road crosses the west bank of Dry creek.

This notice is the first, or preliminary, notice required by the provisions of section two of the Act of the Legislature of California, approved March 27, 1897, entitled, "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with county recorders, and prescribing the effect to be given to recordation of notices of location and affidavits."

In accordance with the provisions of said Act, I claim sixty days from the date of said discovery to enable me to perfect the location of said claim.

Dated and posted on the ground, May 29, 1897.

(Signed.) JOHN WILLIAMS, Locator.

N. B.—A duplicate of this notice is required to be recorded in the county recorder's office of the county wherein the claim is situated, within twenty days from the date of discovery.

Final Certificate of Lode Location—Under Act of March 27, 1897.—I, John Williams, a citizen of the United States, hereby certify that on the 29th day of May, 1897, I discovered a vein of rock in place bearing gold, silver, and other valuable deposits, in section 20, township 6 north, range 11 east, Mount Diablo meridian, Jackson mining district, Amador county, California. On said day I erected at the point of discovery a substantial monument and mound of rocks, and placed thereon a preliminary notice, as required by the provisions of section two of an Act of the Legislature of the State of California, entitled, "An Act prescribing the manner of locating mining claims upon the public domain of the United States," etc., approved March 27, 1897;

That on June 10, 1897, I caused said preliminary notice to be recorded in the county recorder's office of Amador county, and the same is now of record in book B of quartz mining claims, page 50, to which record reference is hereby made for all the particulars therein contained;

That within sixty days from the date of said discovery I performed labor in the development of said discovery, which labor was, and is, reasonably worth the sum of sixty dollars, and consisted of sinking a shaft of ordinary dimensions on said vein to the depth of ten feet, said shaft having been sunk at the place of discovery;

That within said period I distinctly marked the location of said claim on the ground, so that the boundaries can be readily traced, and perfected said location;

That the following is a description of said location as finally marked on the ground:

Commencing at the discovery monument in said section 20, township 6 north, range 11 east, Mount Diablo base and meridian, which said monument is four hundred feet westerly from the point where the Jackson and Volcano road crosses the west bank of Dry creek; thence north five hundred feet to a stake in mound of rocks, said stake being marked "E. 1 N. L. P.," as and for the north lode post, from which post a pine tree, three feet in diameter, blazed and marked "E. 1 B. T.," bears northeasterly sixty feet distant; thence at right angles west three hundred feet to a stake in mound of rocks at the northwest corner of claim stake, marked "E. 2"; thence at right angles south fifteen hundred feet to a stake in mound of rocks, stake marked "E. 3," the southwest corner of claim; thence at right angles east three hundred feet to stake in mound of rocks, stake marked "E. 4 S. L. P.," as and for the south lode post; thence continuing east three hundred feet to stake in mound of rocks, stake marked "E. 5," the southeast corner of the claim; thence at right angles north fifteen hundred feet to a stake in mound of rocks at the northeast corner of the claim, stake marked "E. 6," from which an oak tree, three feet in diameter, marked "E. 6 B. T., bears northeast, distant ninety feet; thence at right angles west three hundred feet to stake in mound of rocks marked "E. 1 L. P.," embracing fifteen hundred linear feet of said lode. All of said stakes are four feet long, four inches square and set one foot in the ground.

This claim is known and called the "Elizabeth."

This certificate is the final notice of location required by section three of the Act of the Legislature of the State of California, hereinbefore referred to.

Dated July 6, 1897. JOHN WILLIAMS, Locator.

STATE OF CALIFORNIA, } ss.
County of Amador. }

John Williams, being first duly sworn, deposes and says: I am the locator named in the foregoing final certificate of location. The facts stated in said certificate are true. JOHN WILLIAMS.

Subscribed and sworn to before me this 7th day of July, 1897.

[Notarial seal.] D. B. SPAGNOLI,
Notary Public, Amador county, California.

N. B —No posting of the certificate is required. It must be recorded in the county recorder's office within sixty days from the date of discovery.

Notice of Location of Placer Claim for Posting.—Notice is hereby given that I, Fred Zeitler, a citizen of the United States, have, this 1st day of August, 1897, discovered a valuable placer deposit within the limits of the north half of the northeast quarter of the northeast quarter of section 12, in township 16 north, range 8 east, Mount Diablo meridian, Washington mining district, Nevada county, California.

By virtue of such discovery, I have located, and hereby claim, said north half of the northeast quarter of the northeast quarter of section 12, in township 16 north, range 8 east, Mount Diablo meridian, containing twenty acres.

Said claim is hereby named the Searls placer claim.

The said claim is marked upon the ground as follows: At the northeast corner of said tract I have placed a stake in mound of rocks, stake marked "S. P. N. E. Cor.," from which a nut pine, one foot in diameter, blazed and marked "B. T. S. P. N. E. Cor.," bears south twenty feet distant; at the northwest corner of said tract a stake in mound of rocks, stake marked "S. P. N. W. Cor."; at the southwest corner of said tract a stake in mound of rocks, stake marked "S. P. S. W. Cor."; at the southeast corner of said tract stake marked "S. P. S. E. Cor."

This notice is posted on mound of rocks at point of discovery, sixty feet southeast from the stake and mound marking the northeast corner of the claim.

Dated and posted on the ground August 1, 1897.

FRED ZEITLER, Locator.

N. B.—If location is upon unsurveyed lands, description should follow suggestions contained in final certificate of lode location. A duplicate of this notice must be filed for record with the county recorder within thirty days from the discovery.

Affidavit of Performance of Discovery Work Upon Placer Claim.—

STATE OF CALIFORNIA, } ss.
County of Nevada. }

Fred Zeitler, being first duly sworn, deposes and says: I am the locator of that certain placer claim known as and called the Searls Placer, notice of the location of which is of record in the office of the county recorder of Nevada county, in book 8 of mining records, page 9, to which record reference is hereby made for all the particulars therein contained; that within sixty days from the date of discovery of said claim I performed labor upon the same, which labor was, and is, of the reasonable value of twelve dollars. Such labor consisted of sinking a shaft ten feet deep to the bedrock, and removing and washing the gravel therefrom.

FRED ZEITLER.

Subscribed and sworn to before me, this 5th day of September, 1897.

[Seal.] F. H. POWER, Notary Public.

N. B.—This must be recorded within sixty days after discovery.

The above is published at this time for two reasons: First, as has been said, in answer to several inquiries as to the proper method of complying with the recent California enactment; and, second, because of the fact that where a lode location is made in this State after November 2nd, '97, it will be possible to do the $50 worth of work required by the California statute and make it a part of the $100 assessment work specified in the Federal statutes, for the next fourteen months. The new mining law of this State says that $50 worth of work shall be done on a claim within sixty days after location. The Federal statute requires an annual amount of work or improvements to the extent of $100, the time for which such work begins being the 1st of January next after the date of location. Then, as stated, where a lode location is made, say, next Tuesday, the 2nd prox., the locator has until the 31st of December, '98, to comply with the requirements of the Federal statute; and as he has until January 1, '98, to do the $50 worth of work required by the State statute, he can have such $50 in work or improvements apply on the $100 required by the national law.

Crowding the Foreigners.

American manufacturers have strong reason for encouragement in the growing foreign demand for products of their workmanship. This result has been attained in the face of the most formidable competition. Naturally enough, the long established nations of Europe are reluctant to believe that their inventors and mechanics can be outstripped or undersold by the same class in a country just turned its first century, but the proof that this can be done is now before them in more than one form. Our manufacturers are honestly entitled to be called the most progressive in the world. They are quick to welcome improvements and they study the whole range of invention with keen interest. In this respect they differ from many European manufacturers who stick to old methods and processes as long as possible, assuming that their way must be right because they were formerly successful.

A few days ago London woke up to the fact that the entire equipment of its new electric underground railway must come from America. The trams and appliances offered in England are inferior and more costly. Electric transportation has reached by far its highest development in the United States and our manufacturers may be depended on to hold their ascendency in this important field. Our bicycles the world over are preferred to any others. American steel rails can be delivered in India at a price shutting out the British mills. Japan, which is not at present disposed to be friendly, has nevertheless recently ordered fifty locomotives to be built in Philadelphia. Their equal can not be obtained in Europe, and that settled the matter as a business transaction. British consuls in Uruguay and Brazil report that the Americans are taking the lead in iron-mongery, cotton goods and silver-plated ware. A colonial blue book states that in Australia there is a general demand for American implements, clocks and boots. Our agricultural machinery has captured the Australian market, and it easily takes the lead everywhere.

Some have contended that foreign markets would be closed to us unless we allow tariffs to be shaped by foreign influences. But events are showing that the higher wages which protection insures to workmen increases their skill, sharpen their ingenuity, and add to their individual effectiveness. The goods they turn out in many lines are more serviceable, adaptable and stylish than any competing kinds, and they sell on merits. When a foreigner wants a reaper, electric outfit, steel rails, bicycle or clock he does not think of tariffs, but invests his money to what he considers the best advantage. Our manufacturers are winning a world-wide reputation for introducing the latest and best devices, and if they will scrupulously maintain the quality of their wares the time is not distant when their general leadership will be acknowledged.

Recent Additions to the State Mining Bureau Collection.

Gold quartz, from Granite King and Mineral Hill mines, Kern and Inyo counties, Cal.; W. C. Rice. Iron ore, good quality, from Humboldt county, Cal. Quicksilver ore, from Redington mine, Napa county, Cal. Yellow ochre, from Valley Springs, Calaveras county, Cal., producing 1 carload per week; Comanche Ochre Company. Chrysoprase, from a new locality in Tulare county, Cal; Dr. S. E. George. Lignite, from 18-inch vein two miles from Garlock, Kern county, Cal.; C. C. Derby. Auriferous gravel, vein matter and wall and dyke rocks, from Coffee Creek, Trinity county, Cal.; Geo. Madeira. Phlogopite, from Sierra Madre, Cal.; Dr. S. Bowers. Quartz crystals, etc., from Mt. Bullion, Mariposa county, Cal.; Miss M. Pothast. Rich copper ore, from a large ledge on the McCloud river, Shasta county, Cal.; Harrington & McNaughten. Handsomely finished model of self-closing trap-door, as used in the drifts of the New Almaden mine, and model of lad-

der; C. C. Derby. Gold quartz, from Black Prince and Caledonia mines, Granite Basin, Plumas county, Cal.; Mrs. A. Christie. Opal, from Dunsmuir, Siskiyou county, Cal.; P. A. Molson; first known occurrence of this mineral in California. Gold in granite, from Amargosa mine, Inyo county, Cal.; A. B. Paul, M. E. Platinum, from Highland Bar hydraulic mine, Taylor Flat, Trinity county, Cal. Gold quartz showing free gold, from Midas mine, Harrison gulch, Shasta county, Cal.; J. H. Roberts. Fossils, crinoid stems, from the auri'erous strata at Mercur, Utah; M. Lindley; interesting as throwing light on the geological age of these remarkable deposits. Native tin, from Orleans Bar hydraulic mine, Humboldt county, Cal.; P. L. Young; second time the occurrence of this very rare mineral has been noted in California. Crude carbonate of soda, from a large bed about ten miles from Mojave, Kern county, Cal.; H. A. Wolff. Menaccanite (oxide of titanium and iron), from Sierra Madre, Cal.; Mr. Quitzow; first specimen received by the Bureau from any California locality. Auriferous sand, from an extensive bed partly owned by the Golden Sands Mining Company of Westport, New Zealand; Capt. M. H. Harrington; this sand, under the microscope, shows a large number of double-terminated quartz crystals —a very unusual feature; the gold is very fine and offers a field for some machine adapted for saving "flour gold." Quartz gold, rich in free gold, from Crawford's mine, 250 miles northeast from Kalgoorlie, West Australia; W. E. Darrow, M. E. Gold on hematite, from Great Eastern mine, Burlong, West Australia; W. E. Darrow, M. E. Telluride of gold, two rich specimens from mines at Kalgoorlie, West Australia; W. E. Darrow, M. E. Electrum (native alloy of gold and silver), from Kalgoorlie, West Australia; W. E. Darrow, M. E. And sundry other specimens.

H. S. DURDEN, Sec'y.

A Mine Dam.*

WILLIAM KELLY.

An exploring drift on the bottom level of the Curry mine, at Norway, Mich., on the Menominee range, cut a stream of water, which increased considerably the expense of pumping. The hope that the supply would drain off was not realized. It was decided to build a dam in the exploring drift, as it was estimated that the cost would be recovered by the saving in fuel in less than two months.

The 8th and lowest level of the mine is 780 feet below the surface. The exploring work had started north from the shaft at right angles across a slate to a jasper formation parallel to that which contains the principal ore body. In this north jasper several hundred feet of drifts had been opened in different directions. The dam was located in the slate near the jasper. The drift at this point is 6 feet wide and 7½ feet high. The amount of water enclosed by the dam would be less if it had been built nearer the face of the openings; but the jasper, though hard to drill, is not firm, while the slates, though softer, are dense and solid, and the impermeability and strength of the adjoining measures were of commanding importance.

The dam was built of local sandstone in the shape of an arch upon its side, with a radius of 6 feet and a thickness of 10 feet. The mortar was made of one part Hilton cement and two parts sharp sand. The abutments were formed by cutting out the sides of the drift in line with the center of the curve of the arch, but leaving the rock rough. The floor was excavated 15 to 20 inches below the bottom of the drift, and the top was made 2 feet higher in front and 5 feet higher at the back. In laying the masonry the front courses of stone were cut to fit the arch and care was taken, particularly at the top, to leave no crevices. Two openings were left through the dam: one, a 5-inch pipe to carry off the water, fitted with a gate valve at the outer end; and the other, a manway of 20-inch steel pipe, plain at the inside end, and with a heavy flange shrunk on at the other, to which a heavily ribbed blind flange, 2½ inches think, was bolted. A small pipe tapped into the blind flange carried a hydraulic pressure-gauge. The 20-inch pipe was anchored in the masonry by three clamps, and the flanges were bolted to three long rods passing through the wall with washers inside. The 5-inch pipe, with a flange on the inside end, was also anchored by three clamps, the arms of which radiated in different directions. As it is nearly 800 feet below the surface, and the source of the water was unknown, the pipe and fittings were designed to withstand a pressure of 350 pounds to the square inch.

The water was shut off about 4:30 P. M., May 13th, 1897, and a little before noon the next day the pressure was 100 pounds, rising to 215 pounds at 3:30 and 240 pounds three-quarters of an hour later. The dam leaked about thirty gallons a minute, the quantity increasing with the pressure. This condition was not satisfactory, and the water was let off. In two hours the pressure fell to forty-five pounds, and the water rose at the shaft about a foot over the floor. A high pressure was produced by a small quantity of water, showing that part of the watercourse was very small.

The closing of the dam seems to have increased the flow. For the thirty days previous, the record of the pumping, measured by displacements, gave an average of 370 gallons per minute. After opening the dam, the average for fourteen days was 413 gallons.

To put in an impervious stratum, a brick wall 22 inches thick was built 2 feet 2 inches from the inside of the dam and the space between was filled with concrete. This was made by mixing four parts of limestone, broken to egg size, with three parts of cement mortar. A short length was added on the inside to the 5-inch pipe, and a piece of old smokestack, 18 inches in diameter, was used for lining the extension of the manway. Owing to the increase in the water after the dam was opened, there was some delay in draining the mine, and it was seventeen days before the addition to the dam was completed. Before closing it, three loads of horse manure were put against the brickwork and held there by a plank partition.

The water was shut off the second time on June 1st, at 9:30 A. M. While the water was accumulating in the drifts, the pressure increased slowly. The following are the readings of the gauge taken every two hours, beginning eight hours after the dam was closed.

Date.	Time.	Pressure, pounds. Per square foot.	Equivalent head of water. Feet.	Increase in 2 hours. Feet.
June 1,	5:30 P. M.	5	12	
"	7:30 "	13	30	18
"	9:30 "	22	50	20
"	11:30 "	30	70	20
June 2,	1:30 A. M.	45	105	35
"	3:30 "	71	165	60
"	5:30 "	130	300	135
"	7:30 "	220	510	210
"	9:30 "	260	600	90
"	11:30 "	268	620	20
"	1:30 P. M.	270	622	2
"	3:30 "	271	625	3
"	5:30 "	272	628	3
"	7:30 "	273	630	2

On June 8th the pressure was 277 pounds to the square inch, equal to a head of 640 feet, and the total pressure against the dam was over 800 tons.

During the morning of June 2nd, before the pressure had reached the maximum, the water which flowed from the dam was collected in a small stream and caught in a pail. It took twenty-two seconds to fill the pail, which held a little over nineteen pints, showing a flow of about seven gallons per minute.

The second day after, though the pressure was higher, the flow had decreased to five gallons, and four days later it had fallen to two and one-half gallons per minute. The water which came through the dam trickled out in eight or ten different places, most of them near the top or one side. The water was milky and left a heavy calcareous deposit on the face of the dam and in the ditch.

After the dam was closed, the record of the pumps for six days showed that the mine was making 115 gallons of water per minute, a decrease of 295 gallons.

The cost of the dam was as follows:

For stone, brick and sand at top of shaft	$ 41 25
" cement	151 70
" pipes, valves and gauge	95 00
" labor sending down materials	16 54
" " breaking stone for concrete	17 77
" " cutting out drift	21 00
" " building dam	141 01
Total	$484 27

The stone was taken from an old foundation, and the cost of quarrying is not included.

* Lake Superior Meeting, July, 1897, of the American Institute of Mining Engineers.

What They All Say.

The MINING AND SCIENTIFIC PRESS is pre-eminently a Western mining journal and labors to develop Western mining interests. Its reputation for accuracy and reliability in its reports stands high in the estimation of mining men everywhere, and rightfully entitles it to confidence and respect. —Telluride, Colo., Journal, Oct. 18.

In the case of Campbell vs. Galloway et al., recently decided by the Supreme Court of Indiana, it appeared that a real estate agent executed a written proposition to sell an oil lease for $250, and procured its acceptance by a person who gave him in return a check for that amount payable to the agent, which was never transferred nor delivered to the owner of the oil well, the agent having no authority except what was conveyed in a letter written by a clerk employed by the owner of a fourth interest in the well, who in answer to a letter asking the employer to "notify me if the lease is for sale and what the price and terms are, and what there is in it for me," replied by letter stating that he would "not sell for less than $250 net to me; all over that you can have," to which he signed his employer's name, although he had no authority to do so. The court held that such written authority of sale could not be enforced, that authority to bind a purchaser at a certain price does not include authority to make a contract of sale at that price, and that letters written by a clerk concerning matters in which he has no authority and signed by his employer's name with the addition of the clerk's initial do not bind the employer.

The famous Eiffel tower and the celebrated Ferris wheel are to be rivaled at the Omaha Exposition by the greatest umbrella of modern times. Standing upon a bluff facing the Missouri river, it will carry passengers in its cars to a height of 575 feet above the level of the river. The umbrella will be anchored in a stone foundation 30 feet deep and 75 feet square. Its structure will be of iron and steel, rising 350 feet above its foundation. With a diameter of 40 feet, it will have a circumference of 126 feet. On the sides of the standard, running from the bottom up. will be forty rails, forming ten tracks for the lower platform to move up and down. On this platform will be a circular track on which another platform is to revolve, the latter platform holding the standard which supports the arms of the umbrella. The arms are to be 110 feet in length, at the extremities of which the cars are to be suspended. From the outer end of the arms cables will reach to the top of the standard. The cars will be constructed on the same principle as those of the Ferris wheel, built of iron and steel, and will hold forty passengers each. There will be sixteen of these cars. The lower platform will also be used by passengers, having a carrying capacity of about 200. This platform will rise to the height of about 240 feet. The whole machine will be operated by electricity. Each car will be lighted with different colored electric lights, and on the top of the standard will be a searchlight, which the exposition company will provide. The umbrella will make three trips an hour.

The London *Statist* has published an article on the world's gold production since 1850, differing materially from the summing up of this paper. With the article a chart is given showing the variations in production in each year from 1851 to 1896, showing what has heretofore been pointed out, viz., that the production of 1896, compared with the average production of the years 1881–90, is practically double the value. The *Statist* takes the exaggerated view usually noticed in journals that do not devote special attention to the subject, and says: "The yield of gold for 1896 may be stated as £45,000,000, against an average of £21,738,000 for the period of 1881–90. For 1896 the production by fields was as follows: United States, £10,800,000; Australasia, £8,988,000; Transvaal, £8,604,000; Indian, £5,911,000; Russia and other countries, £10,697,000, or a total of £45,000,000. The grand aggregate of the gold production since 1850, inclusive, is, in round figures, £1,163,000,000, or approximately 300,000,000 ounces of gold."

On the 8th inst. more than 10,000 students were on the rolls as members of the first freshman class of the Cosmopolitan University. The confusion into which the plans regarding the Cosmopolitan's educational work were thrown by the retirement of President Andrews, in order to meet the urgent wishes of his friends at Brown University, has been met by the acceptance of the presidency by Dr. Eliphalet N. Potter. President Potter has been at the head of two great colleges for nearly twenty-five years, and brings to the work exceptional talents and common sense ideas. He is already at Irvington engaged in organizing his staff of professors. The work of the university has been grouped under fifteen heads, covering the various branches of knowledge. Each of these will be in charge of a professor. As soon as the task of selection is complete the students will be assigned their work, and the largest freshman class in the history of the universities of the world will begin its studies.

H. M. S. VULKAN is the only craft of her special class in existence. She is at once a cruiser, fighting ship, repairing shop, torpedo depot and floating dockyard. As a cruiser and fighting ship, she mounts twenty quick-firing guns and torpedo tubes, as a repairing shop she is fitted up with lathes, drilling, planing, slotting and punching machines, circular saws, workshops and smithery, forges and furnaces; as a torpedo depot she carries on board large supplies of torpedoes, torpedo stores, mines and mining apparatus; as a floating dockyard she contains a small flotilla of torpedo boats with cranes for lifting them, as well as all sorts of special appliances. Her raison d'etre is torpedo nurse and general repairing establishment afloat for general service with a fleet. The Vulkan measures 150 feet between perpendiculars, with a breadth of 58 feet, mean draught 25 feet, and a displacement of 6630 tons.

The population of Massachusetts by the last census taken—the State census of 1895—was 2,500,000. The population of California at the same time was 1,250,000, or just one-half. Massachusetts has long had a high rank in all matters connected with education and public enlightenment. It is the State of several universities, it is prominent in all educational matters, and it is one of the very oldest of the States of the country in point of settlement. Yet Massachusetts has only 88 daily papers, whereas the Golden State with one-half the population of the Bay State, has 113.

Amendment of Federal Mining Law.

TO THE EDITOR:—Please permit a criticism of your correspondent "R." in your last issue. Mr. "R." is not correctly informed as to the occurrence of the beds of amygdaloidal trap forming the lodes of the Lake Superior copper districts.

If there is or ever was a district on this earth where the extra lateral right could be conceded it is precisely on the upper Michigan peninsula. Mr. Houghton, a very prominent engineer for a long time engaged upon these mines, informed me the lodes were so regular that, were it not for the intervening timbers, a cannon ball discharged from one face would, or could, pass along a drift for a distance of 7000 feet and would strike the opposite face without once touching either the hanging or footwall of the beds.

That location by surface boundaries would not tend to monopoly is proven by the testimony of Engineer S. W. Hill of Michigan and Colorado. On page 283, Report Public Lands Commission, he says: "The privilege of purchasing land in whatever quantities needed or desired does not tend to concentrate the landed property of the country in the hands of monopolists. The land is only useful for mining purposes. Our vein is say 9 or 10 feet wide running through the property. Take the Quincy, for example, which owns about 10,000 acres of land: *The company would gladly sell that land for less money than the taxes levied on it.* No mining company has neglected to pay taxes on all its land, and by so much does it impair its dividend fund. Yet there is an immense amount of land held by private parties which is offered for sale constantly, owing to non-payment of taxes."

The proposal of Mr. Freeland to commute the annual amount of work by a payment in cash is an effort to do away with the abuse caused by neglect to do the work as required by law, or its shirking by false affidavits. My own opinion is that such payment should be merely permissive, and that the miner who chooses to work should be allowed to do so. I have a letter from a well-known mining man in the gold belt who writes, "The doing $100 worth of work annually is a perfect farce."

A well-known delegate to the last convention held in this city informed me that in his county he knew of a vast number of locations held for more than twenty years on which not a stroke of work had been done since the original location. The same thing was said to me by one of my colleagues at the meeting of the National Committee in Denver. His precise words were: "Whole districts in my neighborhood have been held for years without any work; the claimants will neither work themselves nor will they let any one else work. It is a crying evil which has become intolerable. Some means should be found to make these men either work or let go." How large a percentage of the California gold belt is so held I do not know, but it is, I am sure, very great.

Mr. "R." does not think that the abrogation of the extra lateral right would sensibly diminish litigation. Senator Stewart is a pretty fair witness on this question. I quote from Eliot Lord, fourth monograph of the Geological Survey, page 145. Speaking of the Chollar-Potosi litigation which he proposed to end by the establishment of vertical boundary planes, he says: "All pending suits should be adjusted as rapidly as possible, and *the main cause of litigation having been removed* he foresaw that the mining industry of the district would expand with natural vigor."

The surface boundaries gives peace and security—inures most to the benefit of the poor man in that he need not go into the courts to assert his rights. A claimholder will have something definite to sell, and the man of means "will know he is getting what he thinks he is buying."

The worst of all monopolists is the locator who will neither work nor allow any one else to work.

San Francisco, Oct. 26th. W. S. KEYES.

Krupp's Great Hammer.

The greatest steam hammer of Germany is still the one called "Fritz," at the Krupp Works in Essen; but, although great care had been taken in providing a very strong foundation, it has settled almost sixteen inches. The construction of the foundation was started in a hole forty feet deep on a grill made of piling. Then there comes a deep layer of sawdust, upon which very large and heavy cast-steel blocks solidly fastened to each other are resting. Next follow three alternate layers of heavy wooden planking and more steel blocks. On top there is a layer of cork forty inches thick, carrying the anvil block, which weighs upwards of thirty tons. This foundation has to carry a total weight of about 2300 tons, and in consequence of its settling the hammer is but seldom used now, having been replaced by a hydraulic press able to exert a pressure of 12,500 tons. This hydraulic press is the largest at the present time in Continental Europe, England being the only country having one of the same size, at the foundry of Beadmore at Parkhead. In this connection, it may be interesting to note that the Bethlehem Iron Works have now a hydraulic press furnishing an equivalent of power of 14,000 tons pressure.

A Case Where Theory Failed.

Did you ever observe the difference in the appearance of a piece of mchanism that had been designed on scientific principles, with every part figured out to stand the strains that theoretically should come upon them; every journal having just the proper amount of surface for the load; and another piece of mechanism for the same duty, but which had been developed by experience with the working of many predecessors? No scientific reason could be given for the forms into which certain parts had developed, except that they would not work satisfactorily in any other form.

A vessel was built on the Atlantic coast several years ago and was engined by a scientific man. Every part was evidently planned in accordance with correct principles, so far as that particular part was concerned. The engine was triple expansion; the forward part of the shaft was made the correct size for the high-pressure cylinder; the middle part was made the correct size for the intermediate pressure cylinder, with the after part was made the correct size for the low-pressure cylinder, with the intermediate and high-pressure added.

I had a talk with the designer of this strange-looking machine, and he was positive that the general practice of marine engine builders was all wrong in this particular, and on many other points.

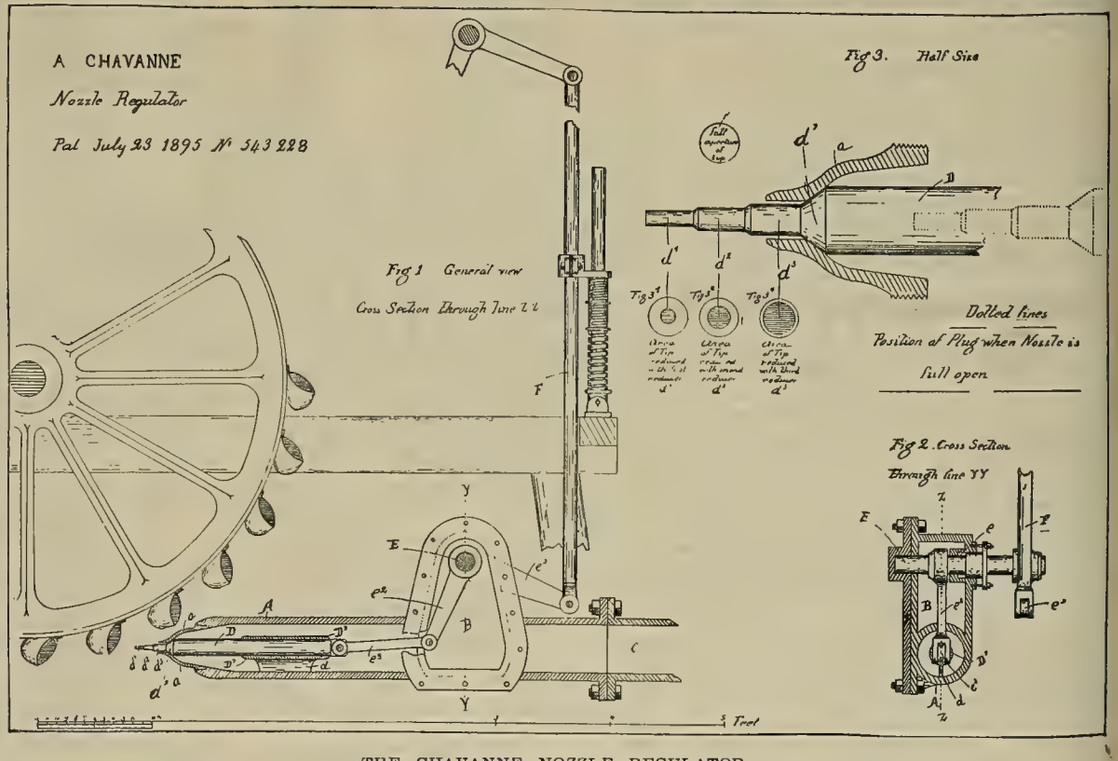
"Why?" he asked, "should the crank shaft be made of the same size throughout, when, if the engine is properly designed, the forward part transmits but one-third the work, the middle part two-thirds, and the after part the whole work of the engine?"

Here the want of experience resulted in a failure, because the designer thought that the general practice was the result of lack of knowledge. He could not foresee that his journals and crank pins, being all of different diameters and lengths, and consequently having different velocities, would wear unequally, and that the shaft could not be kept in line.—George W. Dickie in Cassier's Magazine.

WITH the November issue the title of "The Colliery Engineer and Metal Miner" will be changed to "Mines and Minerals." There will be no change in the ownership nor in the editorial management. The form and size of the publication will remain the same and the policy of taking advantage of every opportunity to improve it will be continued. The new name has been adopted because it expresses the scope of the publication better than the old one.

The Chavanne Nozzle Regulator.

The claims of the manufacturers of the Chavanne nozzle regulator for tangential impact water wheels are: "First—A simple device, no sliding surfaces in contact and no leaks. Referring to the sketch, Fig. 1, the nozzle *A* is of the usual cylindrical form, terminating in a tip *a*. The outlet of the tip is bored to a sufficient size to give the maximum amount of water required. Inside the main body of the nozzle and forming part of the casting will be noticed a guide sleeve *D*. This is bored out to receive the regulating portion of the device, a bronze plug valve *D*, which by suitable connections (Figs. 1 and 2) can be moved back and forth at the will of the engineer. The head of the plug *d'* is made tapering to fit the inside taper of the tip, so that when pressed forward it closes the opening and shuts the water off completely and effectually. There are no sliding surfaces in contact, as in the ordinary gate, and therefore no cutting, consequently no leaks. Second—There is also an easy and perfect regulation of the water. Its quantity can be varied to suit the requirements of the work. Its pressure is constant. Every drop that passes through the nozzle gives the maximum amount of power, and consequently no water can be lost. Jars and shocks to the pipe line are effectually precluded. Referring again to the same sketch (Figs. 1 and 3), it will be observed that the plug terminates in a series of reduced diameters, d^1, d^2, d^3. The surfaces are in all cases parallel



THE CHAVANNE NOZZLE REGULATOR.

with the flow of water. Therefore the water must issue in parallel lines, meeting no obstruction until its concentrated volume impinges upon the wheel. The action of the regulator while being operated is as follows: Suppose, for the sake of illustration, that a load is being hoisted from the bottom of a shaft to the surface. Fig. 3 shows that the third reducer d^3 on the end of the plug almost fills the outlet of the tip, so that when first opened the flow of water is barely sufficient to move the wheel. This assures an easy and quiet starting of the load. A further opening (Fig. 3) gives more water and increased speed, but whether the amount of water passing be small or large, it will always have its full effective pressure. In truth, if there is any change at all, the pressure will be increased when the stream is reduced, and this results, by reason of the fact, that in reducing the outlet to suit the load the flow which supplies the nozzle is never interfered with. As the load approaches the surface the motion is reversed and the stream is gradually and gently cut down to a minimum, when there is so little water passing through that the final closing is accomplished without any perceptible shock—the whole operation being as quietly and easily performed as the handling of the throttle on a steam engine."

The Joshua Hendy Machine Works, No. 42 Fremont street, San Francisco, have been appointed agents for the manufacture and sale of the Chavanne nozzle regulator.

Electrical Progress.

Surface Contact Street Railway System.

The introduction of a commercial electric traction system, involving the principle of surface contact, while eliminating the distinguishing feature of the overhead and underground contact systems, is an event which street railway men have long been expecting, and which is now an accomplished fact. Experiments stretching over many months have been carried on continuously at Schenectady, N. Y., and the occasion of the visit of Lord Kelvin was taken advantage of by the General Electric Company to make public their successful outcome.

The demand for a commercially practical system of surface contact electric traction has existed since electric traction was first introduced, but such a system had to come to its appointed place after the overhead and underground contact systems. Various schemes have been evolved in the past which have either been discarded as impracticable or have appeared before the demand for them has become acute enough to encourage their development. To-day the demand for a surface contact system exists and, peculiarly enough, this demand comes from Europe. In an European city the first practical surface contact electric railway is already far advanced toward completion.

The experiments at Schenectady have been carried out upon a stretch of the track which forms part of the extensive factory tramway system of the General Electric Company's works. As the illustration shows, the addition to the road bed between the rails of the track consists simply in two parallel rows of iron discs, convexed to a height of about one inch above the level of the rail. The car shown in the illustration is a simple factory tramway to which the controller, motor and storage battery equipment have been fitted. It may be said here that the General Electric Company is now engaged in changing over to the surface contact system the entire trolley tramway system in its yards.

The main requirements in a surface contact system are four: Low cost of installation and maintenance; absolute absence of current from all discs not covered by the car; freedom from leakage of current, and reliability under all possible conditions of weather, service and location. It is the attempt to meet simultaneously all these requirements that has rendered the problem one of considerable difficulty, demanding long study and costly experiment to overcome.

In the G. E. surface contact system, it is claimed that the requirements are adequately complied with, and from the description which follows this will probably be admitted.

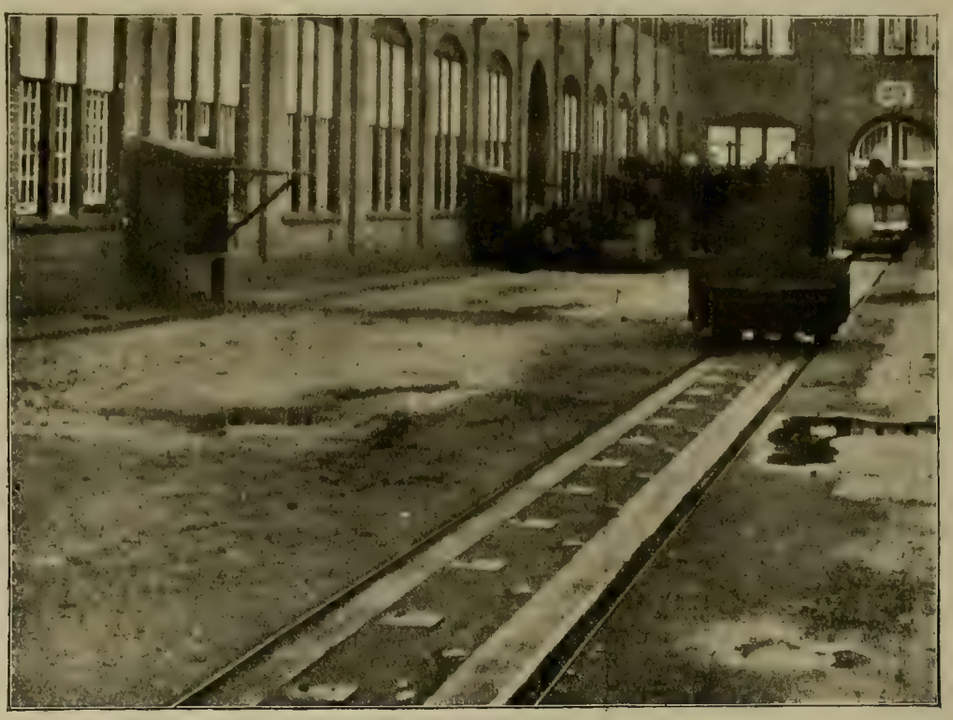


FIG. 1.—G. E. SURFACE CONTACT SYSTEM, SHOWING STRETCH OF TRACK IN YARDS OF GENERAL ELECTRIC COMPANY'S WORKS AT SCHENECTADY, N. Y.

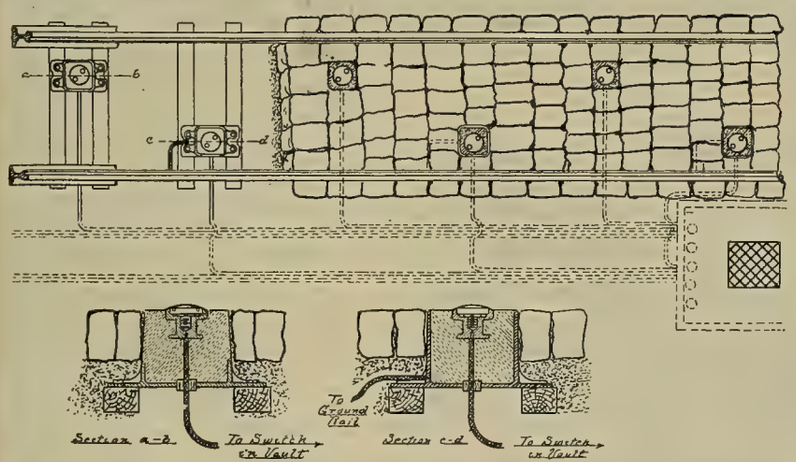

FIG. 2.—G. E. SURFACE CONTACT SYSTEM, SHOWING METHOD OF OPERATION.

The only live portion of the G. E. surface contact system, on the street surface, are the contact plates immediately beneath the car. This is true, whatever the position of the car and whatever the speed—each plate in turn communicating current to the motors and becoming inert as the contact shoe on the car leaves its surface. These contact plates are placed in parallel rows between the two rails of the track and are set alternately. In the illustration the positive, or communicating, discs are on the right, the negative or discharging discs are on the left—one of each between two of the others. Each positive contact plate is made alive by the operation of an automatic magnetic switch, which, instead of being placed in immediate juxtaposition with its plate or opposite it outside the track, is placed in a manhole with a large number of others, each connected to its own respective plate. Through each negative plate is performed the double duty of closing the contact in the switch which "cuts in" the positive plate and of receiving the return current from the motors. Fig. 2 shows the arrangement of the plates.

The operation of this system will be understood from the diagram, Fig. 3, A′ A″ and the negative plates, B, B′ and B″, the positive contact plates, placed equal distances apart, a little less than one-half the over-all length of the shoe. C, C′, C″ represent the automatic magnetic switches, and D, D′ and D″ their armature or contact makers. F is the positive or collecting shoe, E the negative or return shoe, and C the track return. H and K are switches which form part of the controller, the latter connecting in, or cutting out, the cells of a small storage battery, which is used only to energize the coil of the first switch through the plate over which the car passes in starting. After the armature of the first switch has been raised into contact, and the line current has completed its circuit, the battery is cut out by the forward movement of the controller handle. In the diagram the car is to move to the right and all the magnetic switches are open. The handle of the controller is turned to the first notch and switches H and K are closed. Current from the battery flows through a small portion of the motor resistance to the shoe, thence to contact plate A, and the coil C′ completing the circuit to the ground. The coil C′ thus energized raises the armature D′, closes the circuit through the automatic switch, and the line circuit completes its path through the motors and through the greater part of the

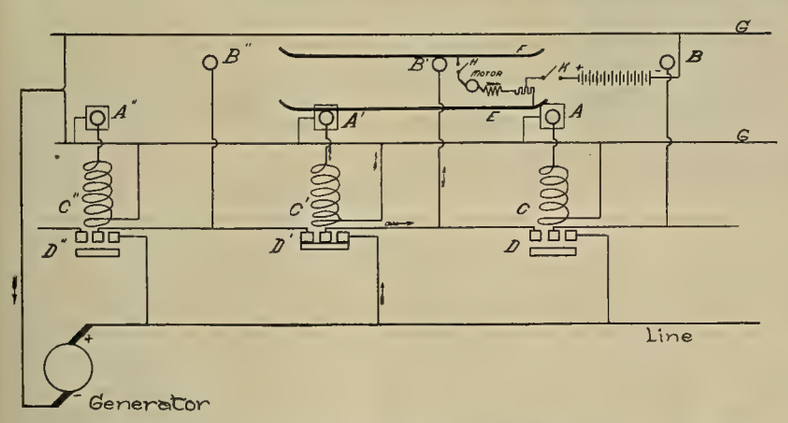

FIG. 3.—G. E. SURFACE CONTACT SYSTEM, SHOWING SURFACE OF STREET AND SECTIONS THROUGH POSITIVE AND NEGATIVE PLATES.

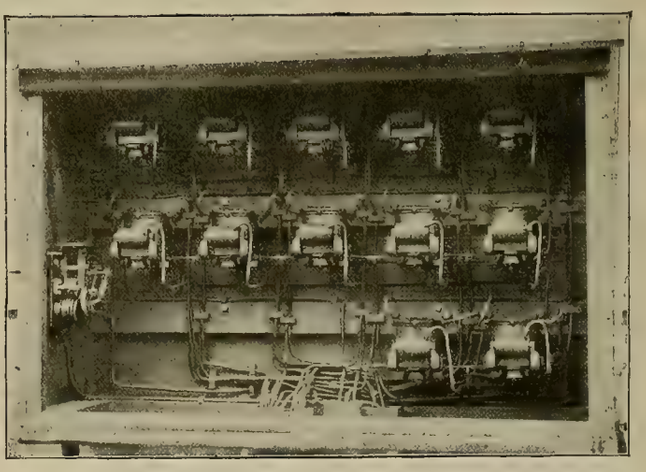

FIG. 4.—G. E. SURFACE CONTACT SYSTEM, SHOWING AUTOMATIC MAGNETIC SWITCHES IN TEMPORARY MANHOLE.

motor starting resistance shown by the arrows through the positive plate B and shoe F. Part of the return circuit goes to the storage cells, which are kept constantly charged, and part through shoe E, negative contact plate A′ and coil C′ to ground, keeping the latter energized and the automatic switch closed so long as the shoe remains on contact plate A′. Moving the controller handle forward from the first notch to the second notch opens the switch K, cuts out the battery and sends all the return current through the coil C′. The shoes E and F in the diagram are a little longer than the distance between contact plates. Thus, when the car moves forward slightly, the shoe will be in contact with the two contact plates A and A′, and the return circuit will divide, half going through coil C′ and half through coil C, energizing both, and closing the armatures in the switches D′ and D. The car moves forward and the shoe passes beyond the contact plate A′. The circuit in the coil C′ is broken, the armature D′ drops, cutting out entirely positive plate B″, leaving it dead, but allowing B′ still to receive current through the closed switch at D. Shoe F moving forward then makes contact with plate B before it leaves plate B′, and the current is interrupted in its flow.

The automatic magnetic switch is the heart of this system. It has been designed to endure under the severest strains and to act with such uninterrupted precision that the working of the system may not be impaired. The development of this automatic magnetic switch marks a decided step forward. Mechanically the switch is simple, strong and durable, with all chances of derangement reduced to a minimum. In the course of the experiments this switch has been subjected to the rougest possible usage and has withstood it unharmed.

If the leakage is great an arc is likely to form when the armature of the switch drops and so long as this is held the contact plate in the street would remain alive, while the arc would burn the switch. It is not practicable to allow the armature to drop far enough to break the arc, and, to extinguish it, the magnetic blowout principle is brought into play. By the use of this retention of this arc is impossible. But there is also the possibility of another arc forming in case of accidental ground on one of the leads to the positive contact plate or if the forward switch fails to close when the handle of the controller is on the first notch, giving a path to ground through the battery. This is also taken care of by the magnetic blowout. All surface contact systems have similar conditions to meet but none have incorporated the magnetic blowout principle.

The form of the contact plates is shown in Fig. 2. They are first set in iron boxes and then surrounded by insulation. The contact plates consist of two parts, a wearing piece screwed into a support and held by a spring washer. This wearing piece can be removed readily without disturbing the support. The standard shoe is 13 feet long. The shoes are supported from the axles and have a slight upward and downward movement to allow for any irregularities in the height of the contact plates. The amount of drop in the shoe is regulated by a set screw.

The automatic magnetic switches are grouped in manholes, where inspection can readily be effected. Fig. 4 shows a group of these temporarily arranged for exhibition. Each manhole will contain about twenty switches, and the wires from the contact plates to them will be protected in similar manner to underground wires for any other purpose. The battery on a car consists of ten coils with normal capacity of fifty ampere hours at five amperes. It is equal to all emergencies, being called into requisition only momentarily while being charged, the balance of the time the controller handle is on the first notch. A close examination of the design and operation of this system will show that it possesses many striking advantages. The operation of the automatic switches is perfect under all conditions, as the full line voltage can be secured to close them and they open by gravity. There is no possible chance of the contact remaining electrified after the car has passed, as by the use of the blow-out on the switch and the switch itself, which opens as soon as the current is shut off, all danger and trouble to live contacts are eliminated. Grouping the switches in manholes renders the working part of the system easily accessible for inspection. In the city of Monte Carlo, in the principality of Monaco, this system is being laid down by the Cie. Francaise Thomson-Houston over a distance of about three miles. It is expected that this will be in operation very shortly.

Electro-Plating Aluminum.

Aluminum which has been well cleaned with nitra-hydrofluoric acid can be readily plated with copper in the way that such platings are usually applied. Upon the copper plating which can be put on in a very retentive coating of any desired thickness, either gold, silver, nickel or other plating solutions can be used. In some cases aluminum can be advantageously plated with other metals directly without first plating with copper. Aluminum is now sold at a price per pound about equal to that of nickel, and not largely in excess of that of German silver. Volume for volume it is much cheaper than German silver, and for replacing German silver or Britannia metal as a base in silver-plated vessels, its power of retaining heat and its lightness, together with its much cheaper price, will certainly cause its extensive use.

One method of plating is as follows: The aluminum is first immersed in a bath of acetate of copper dissolved in vinegar, to which oxide of iron, some sulphur and aluminum chloride have been added. This gives a deposit of copper over the surface. After this the article is brushed with a soft brass wire brush and well rinsed in clear water, and is then placed in the electrolytic bath to be plated in the usual manner. If the work is well done, this plating is so strong that no reasonable amount of bending will cause it to chip off or crack. After being plated with silver or copper, the article may be treated by the sulphide process for "oxidizing," giving the same results as "oxidized silver."

Another method consists of first cleaning the aluminum with an alkaline carbonate, after which it is thoroughly washed in water. This is followed by an immersion in a five per cent solution of hydrochloric acid and another washing in pure water. A preliminary deposit of copper is then placed on the article by immersing it in a weak but slightly acid solution of sulphate of copper. It is then thoroughly washed and placed in the electrolytic bath.

The Velocity of Electricity.

The term "velocity of electricity," says F. F. Grays in "Home Study Magazine," is often heard, but is seldom understood, for the apparent meaning of the words is not the real meaning. As a rule, a man understands by the velocity of electricity much the same thing as he would understand by the velocity of a railroad train. For instance, a train goes from New York to Buffalo, a distance of 500 miles, in ten hours, and the velocity of the railroad train is 500 divided by 10, or 50 miles per hour. This is all right for the railroad train, but it will not hold for electricity, although a man well known in scientific circles once attempted to determine the velocity of electricity in a similar manner. An ordinary telegraph sounder in St. Louis was connected, by means of a special wire, to a key in Cambridge, Mass. The distance between the two cities was exactly determined and the man in Cambridge closed the circuit, by means of the key, at a certain instant, while the man in St. Louis noted the time that he heard the click of the sounder. Of course, the time was determined very accurately by means of chronometers which had been carefully compared. In this way, by knowing the distance and the time it took for the signal to be sent from Cambridge to St. Louis, the so-called "velocity of electricity" was found.

Before we can understand why this determination was utterly valueless, it will be necessary for us to know what is the exact meaning of velocity of electricity. But, again, before we are able to understand even this, we must have in our minds a very definite and clear conception of what is meant by a "current of electricity." We do not mean to say that we must know definitely what a current of electricity is, for that no one knows. We merely say that we must understand exactly what the expression "current of electricity" is intended to convey to the mind.

When the poles of a battery are connected to the opposite ends of a wire, we say that a current of electricity is flowing through the wire. We do not really know that there is anything passing through the wire, but we do know that certain effects are produced; and when these effects are produced, we say that a current of electricity is flowing. In the first place, the wire grows hot, and one way of determining the strength of the current of electricity is by measuring how hot the wire becomes. We are, however, not interested in this effect of the current so much as we are in what is called the "magnetic effect." Had a compass needle been near the wire when it was connected to the battery, the needle would have been deflected from its ordinary north and south position. In other words, when a current of electricity is flowing through a wire, there is a magnetic field around the wire, "magnetic field" meaning that in the neighborhood of the wire there is a force which will act on a compass needle just as would a magnet. The direction of this magnetic force is always in circles around the wire, as illustrated in the figure, where a is the cross-section of a wire supposed to be placed at right angles to the paper. The circles around the wire indicate the direction in which the magnetic force acts when the current is flowing upward through the wire.

Near the wire the magnetic force is stronger than it is farther away from the wire. When the wire is first connected to the battery, this magnetic force appears first at the surface of the wire and then a little farther out, and then still farther, and so on. In other words, it grows from the wire outward. This growth, however, is not as slow as might be imagined from the description. It is the velocity of this growth that is often called the velocity of electricity, and from many extensive experiments it has been found to be the same as the velocity of light, viz., about 186,000 miles per second. It is evident that the experiment between St. Louis and Cambridge did not measure this velocity.

It may now, however, be worth while for us to try to see just what this experiment did measure. In the first place, it is an established fact that, when a current of electricity is flowing through a circuit, the strength of the current at any instant is exactly the same in any one part of the circuit as it is in any other part of the circuit. That is to say, when the circuit was made between Cambridge and St. Louis, the current at any instant in Cambridge was exactly the same at that same instant in the other end of the wire at St. Louis. Now, the sounder will not click unless a current of a certain strength be put through it. There might be a current flowing through it for days and yet the sounder might never come near clicking, if the strength of the current were below a certain value. When a wire is connected to a battery, it takes time for the current to attain its full strength. That is to say, a tenth of a second after the circuit is closed the current will have a certain strength; when another tenth of a second is passed the current will be a little stronger; at the end of another tenth of a second it will be still stronger, and so on until it has finally reached its maximum strength. But remember that at any instant, say at the end of the first tenth of a second, the current has the same strength in every part of the circuit. When the circuit was closed in Cambridge, the current did not at once reach a strength sufficient to make the sounder click, the length of time that it took to reach this value depending upon the kind of wire used in the circuit and the shape and size of the sounder, etc. What was really measured in this experiment then was not how long it took electricity to pass from Cambridge to St. Louis, but how long it took the current throughout the whole circuit from Cambridge to St. Louis to grow to a certain strength. Moreover, this velocity of growth depends more upon the size and shape of the sounder used than upon the distance between the key and the sounder.

The writer has seen a circuit which was not ten feet long in which it took more than a minute for the current to reach its full strength, while another circuit 100 miles long allowed the current to reach its full strength in less than one-tenth of a second.

It is not the purpose of this article to discuss the reason that the current grows more rapidly in one circuit than it does in another.

Our only purpose has been to show, first, what is meant by the velocity of electricity; and, second, that no such simple experiment as that tried between Cambridge and St. Louis determines this velocity.

Scientific Progress.

The Kaiser Wilhelm der Grosse.

The North German Lloyd steamer Kaiser Wilhelm der Grosse arrived at the port of New York on the 26th of September, her maiden voyage. This ship is remarkable. She is the largest ship afloat and nearly as large as the now non-existent Great Eastern. The speed on her voyage, for a single day's run, exceeded that of any ship ever set afloat. The record for the run between Southampton and New York was broken, and the speed of the ship was such that had the voyage been between Liverpool and New York the run would have been considerably shorter than that of any steamer on that route.

The ship has the following dimensions, beside which are here given those of the Great Eastern, the marine wonder of forty years ago:

	Kaiser Withelm.	*Great Eastern.*
Length over all	649	697
Beam	66	83
Draught	26	30
Depth	43	58
Gross tonnage	14,000	19,500
Displacement	20,000	27,000
Horse power	30,000	12,000
Speed, knots	23	12

The driving engines of the Kaiser are triple expansion, one engine on each side of her twin-screw shafts, with steam cylinders 52, 89¾ and 96¼ inches (two of the latter to each engine) diameter, and drive two three-bladed screws, 22 feet 3¾ inches diameter, 32 feet 10 inches pitch, with a maximum of 30,000 H. P., at the rate of twenty-three knots through the water (twenty-six miles) an hour. The propeller shafts weigh 166 tons, the bronze screws 26 tons each. The condensers contain 35,522 square feet of cooling surface, their 11,000 tubes measuring a total length of about thirty-five miles. There are, altogether, 68 engines on the ship, with 124 steam cylinders. The centrifugal pumps and the engine bilge pumps can, together, expel 3600 tons an hour. Four dynamos are employed for lighting purposes, supplying current to 1600 25-candle-power lamps. The cost was $3,500,000.

The hull is enormously strong, is divided by sixteen transverse bulkheads and one running longitudinally. The fourteen boilers are in four groups, each in a separate compartment, and the two main engines are similarly isolated. A double bottom gives addi-

tional safety. Accommodations are provided for 350 first cabin and as many second cabin and 800 steerage passengers, and for a crew of 450 men, including 17 engineers, 18 boilers, 90 stokers and 75 coal passers.

With steam at 180 pounds pressure this ship developed 28,430 H. P. and made a run of 564 knots in a single day—the highest record yet known. The run from Southampton to New York was made in 5 days, 22 hours, 35 minutes (3050 nautical miles), averaging 22¾ knots for the fastest twenty-four hours, 21.39 for the voyage. About 500 tons of coal a day were burned on the trip. The record from Liverpool to New York, now held by the Lucania, is 5 days, 7 hours and 23 minutes, but the Kaiser could make the run in about 5 days.

ABOUT the middle of November the earth crosses the orbit of a remarkable stream of cometary fragments, whose fall into our atmosphere gives rise to the Leonids, or November meteors. These particles move in an orbit whose period equals about thirty-three of our own years, and some of the most brilliant celestial phenomena ever witnessed by man have been due to the fact that this stream of world dust is mostly condensed into a small portion of the great orbit. Hence it is that on five or six years out of the thirty-three the November meteors are likely to be especially notable. The maximum display is expected in November, 1899, but as a magnificent downfall was witnessed in Europe and in America on the morning of November 13, 1864, two years before the last maximum, it is expected that the earth will again enter the denser portion of the meteoric stream this year. Our planet will be central in the stream on November 14, just before daylight in America. This will be midday for Europeans, while American observers will have the disadvantage of a moon only five days past the full, so that the expected meteoric shower will probably not be seen at its best.

TO THE pure scientist, absolute accuracy and relative completeness of knowledge are all-sufficing inducements to the most painstaking and elaborate research, although (from a practical point of view) the results obtained may not justify the expenditure of time and money when viewed in an economic light. Thus, exact measurements of the atomic weight of nitrogen undertaken by Rayleigh and Ramsay revealed the non-commercial fact that nitrogen derived from chemical compounds is one-half per cent lighter than atmospheric nitrogen, which discovery led to the detection of the now well-known element argon. Interesting, however, as this substance may be from the standpoint of pure chemistry, its very distinguishing characteristic (namely, inertness) renders it a drone in the active field of chemistry, though it certainly may still prove useful as a non-combinable diluent in the investigation of the thermic and chemical properties of gases. Still, all this affects the individual who asks, "What is truth?" rather than him who questions "What is the use?"

T. SAVAGE in British patent 21,953, October 3rd, 1896, proposes to use nitrate of soda in conjunction with sulphuric acid in manufacturing copper sulphate. The customary dissolving and crystallizing plant is used. The process may be conveniently carried out as follows: Fifty-six pounds of copper, 84 pounds of sodium nitrate, and 168 pounds of 1.2 specific gravity acid are placed in a steam-heated tank. When the solution is saturated it is syphoned off into the crystallizers. It is claimed that the solution of the copper is effected in one-sixth the time and at less cost than by the old process.

THE sunshine of southern California is being put to practical use by means of a solar water heater, which is being largely used in that section. It heats water by the sun's rays, and by its use hot water may by had for a bath and other domestic purposes at all hours of the day and night, the invention working automatically. It is claimed that after the apparatus is once in there is not a cent of expense, nor need a minute of time be devoted to it.

THE source of the Roentgen rays from a focus tube is determined by Molloy, a Scotch physicist. A small pine board, into which several rows of slender nails have been driven, is attached to the back of a fluorescent screen and the whole mounted on a stand which can be slowly revolved in a circle about the focus tube. The shadows of the nails indicate the exact position of the source of radiation. On adjusting the tube so that the central nail gave only a black spot for a shadow in all positions of the screen, it was found that the radiation must come from near the center of the platinum plate. By means of a pin-hole image, the area of radiation was shown to be an irregular circular patch about a quarter of an inch in diameter.

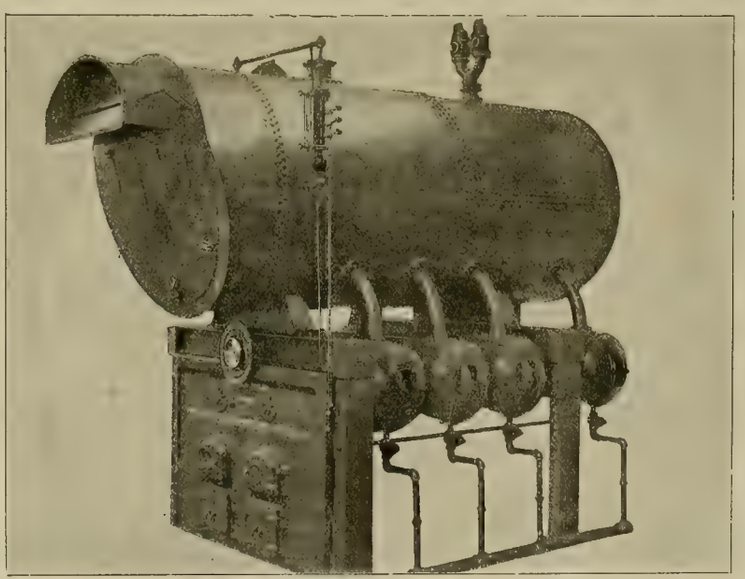
RENEWED ATTENTION has recently been drawn to the Cassel-Hinman process for extracting gold from its ores. A report upon this process has been prepared by William Brookes and William Ramsay. They say: "Our experiments show that an extraction from 90 to 95 per cent of the gold present may be reckoned on, and that there is no important loss of bromine. We may add that the simplicity and ease of working, and the cheapness of the chemicals, render this a valuable process."

Mechanical Progress.

The Sederholm Boiler.

The cut on this page is of a 240 H. P. Sederholm boiler, built by Fraser & Chalmers, of Chicago, showing boiler set up ready for brick work.

These boilers are intended to work under 125 pounds pressure, and others for as high pressures as 180 pounds and of capacities up to 350 H. P. Some of the advantages claimed for this boiler by the manufacturers are: The main shell is protected by the furnace drums from the direct action of the fire; the blow-offs are arranged to each end of drum; the circulation minimizes the danger from burning, and increases the economy of the boiler by the effectiveness of the heating surface; the boiler takes up unusually small floor space, and can be built in very large units; requires a very small amount of brick work; can be thoroughly cleaned at every part, and has an exceptionally free sweep for the flame.



THE SEDERHOLM BOILER.

A NEW revolver is the 1897 invention of Bergmann, of Bavaria—an "automatic pocket-pistol." All it requires is to pull the trigger once, whereupon it empties itself of six loads in two seconds, sending a 32-caliber steel bullet with such velocity that a 6-inch hardwood plank is pierced at a distance of 300 yards. There is an automatic lock by which the weapon is made safe. There is a spring which may be so worked that the firing may be arrested at any point under the sixth shell. The marksman can decide before he pulls the trigger just how many shots he wants to fire. All of the recoil is utilized by the mechanism, and it is the force of the recoil which discharges all the shots after the first one.

Sand Blast on Steel Structures.

The preservation of iron and steel structures from corrosion is among the grave concerns of the modern builder and architect. The extensive use made of this material in the huge buildings and bridges characterizing modern practice has made the necessity of their preservation more palpable and important than ever. In the case of viaducts and bridges, where exposure to the elements and every changing phase of atmospheric conditions is unavoidable, the policy of adequate protection from the standpoint of economy and security becomes definite and positive. Corrosion is a deadly enemy to the stoutest of metallic frameworks, and it can bite its way in silence into the heart of the most massive structures. In the case of bridges the free use of paint has postponed the inevitable, but skin of pigment is seldom more than a temporary precaution. An example of this is shown on the big viaduct of the elevated railway in the city of New York. About five years ago this structure was thoroughly cleaned and painted, and it was thought that this precaution, along with careful maintenance, would make it last at least a lifetime. At the point over the elevated railroad, however, the corrosion, due to the escaping gas and steam from the hundreds of locomotives passing and standing beneath, has completely destroyed the paint, and is now rapidly eating away the steel, thus slowly and surely destroying the life of the viaduct.

The Commissioner of Public Works, in casting about for a remedy, or some better method of protection, acting under the advice of the consulting engineer, decided to adopt the sand blast process, to break away the scale and oxide, and to thoroughly clean the metal. There are 51,000 square feet in the structure that is rust bitten, and it will take about seven weeks to remove the corrosion. The application of the process has, so far, given satisfaction, and its ability to remove the rust and preserve the structure is in a clear way of practical demonstration. The result of the New York experiment will be watched with interest. It is proposed to sand blast all the iron and steel work of the new East River bridge before putting in place. Should this be successful and a precedent established, this plan may eventually come into general practice.

AT Lake Merced, Cal., near San Francisco, has recently been completed a tunnel 3100 feet long to the ocean, approached by a canal 3800 feet long, which conducts the surface waters from the entire watershed to the tunnel proper. The effect of the entire piece of engineering, together with a sluiceway seven miles long, running from Colma, is to convey all impure water from the Spring Valley Water Co.'s reservoir there into the ocean. In building the tunnel, after the workmen had blasted several hundred feet they came upon a bed of dangerous quicksands. Engineer Schussler bored a hole into the tunnel from the surface, the water was pumped out and the tunnel then pushed through the quicksands. The springs under the hills were forced into a minor tunnel which runs up the hill to the lake. Thus, says the *Call*, through one great conduit the odd sight is beheld of impure waters running to the ocean, while a stream of pure water passes the sewage far under the hill.

A LITTLE confusion exists, even in the minds of persons having some degree of practical knowledge on the subject of metal working, as to the proper usage of the terms hardening and tempering. It is very common, for instance, to hear one speak of the temper of a pivot, die, or what not, when in reality the whole process of hardening *and* tempering is what is referred to. The hardening of a steel piece is effected by heating it to a dull redness and quenching suddenly. The tempering of the piece is effected by heating it to a temperature considerably below redness and then allowing it to cool slowly.

RUBBER tubing is used as a core for casting pipes for underground service in the novel method of a French engineer. The trench is dug and given a bottom of cement mortar, then the tubing, inflated and covered with canvas is placed on this bottom and the trench is filled up with cement mortar. When this has set the rubber core is deflated and removed for use elsewhere. This plan of molding conduits is simple and economical, and 6-inch pipes from hydraulic lime and sand are said to have been made at seven or eight cents a foot.

THE recent announcement that contracts had been signed for the delivery in England of 1000 tons of crude aluminum of American manufacture recalled attention to the fact that this metal is now produced in the United States in large and increasing quantities. A few years ago the manufacture of aluminum on a commercial scale was regarded as almost beyond the range of possibility.

THE Blue Lakes Water Company at Mokelumne Hill, Cal., now has machinery in operation capable of developing 2000 horse power. Electric lights are run by this power in several towns in Amador county, and arrangements are being made with companies owning mines in both Amador and Calaveras counties for operation by electricity. Up to this time the Blue Lakes Water Company has furnished water power for running some of these mines, and now expects to be able to furnish them with a kind of power which will be cheaper and more effective. The company considers it is feasible to develop 10,000 horse power at Mokelumne Hill by putting in the necessary machinery and that, should it be desired to do so, the power could be conveyed to Stockton, a distance of thirty-nine miles. At Fresno an electric power transmission plant is already operating over a distance of thirty-six miles, and in southern California one is now building which will transmit power from the neighborhood of Redlands to Los Angeles, a distance of seventy-five miles.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: Mrs. Jennie Ritter, owner of the Michigan Bar Mining property and ditches, which were sold to the Interior Development Company about three years ago, has foreclosed the mortgage on the property on account of deferred payments. The company has put in about $35,000 in substantial improvements and is now engaged in reorganizing the company with the expectation of redeeming the property within the statutory period.

Record: The Zeila mill is crushing ore from the 6-foot level at present. At the 1000-level drifting continues.

It is expected that the Argonaut mill will begin running next week.

C. B. Dillon has been appointed superintendent of the old Centennial mine now being reopened by a San Francisco company.

C. B. Zeek, superintendent of the Red Hill mine, near Butte basin, proposes to use electricity for motive power at the mill.

Butte.

(Special Correspondence).—At the Magalia gravel mine, formerly the Pershbecker, a 10-stamp mill was completed and started crushing on the 15th inst. The mill and hoist are run by water; the drilling and underground pumping by compressed air reheated by steam. The shaft (vertical) to the channel is 510 feet. The face is down about 2000 feet from the shaft. The crushing is about ninety tons in twenty-four hours. The flow of water is 40 inches.

The Bader gravel mine, two miles from Dogtown, has a bedrock tunnel 2000 feet. At 1400 feet the tunnel struck into rapids, from which "big pay" was taken, but the bedrock pitching, a new direction was taken. The workmen expect to break into the channel this week. Geo. B. Mowry of San Francisco is the owner.

Wikle & Lockwood have discovered and located a ledge three and one-half miles southeast of Dogtown. The ledge is 18 feet wide. The owners claim that mortar tests of the croppings yield $30 per ton. The formation is slate and porphyry.

The Butte Creek Power & Gold Mining Co., a Chicago corporation, are sinking and running tunnel and upraise on the former Carter mine, one mile below Nimshew. They are also constructing a ditch and 8-foot flume.

The Ethel, bonded by N. A. Harris to a New York company, Thos. Price manager, has run a bedrock tunnel 800 feet, aiming for the channel. The property is four miles west of Dogtown, on Middle Butte creek.

The tunnel on the Golden Gate, near Coutelene, has reached 1700 feet in bedrock. The property belongs to the syndicate operating the Banner mine.

Dan Meredith is working a side hill for stringers in a decomposed quartz and porphyry, which he runs through sluice boxes. Others are picking the tailings and they are said to be making good wages.

The Banner mine, six miles from Oroville, has taken down the old 10-stamp mill and is erecting forty stamps. Mr. Evans is making an experiment which if successful will prove quite an innovation of its kind. He is building the foundation and mortar blocks of concrete. The ledge on this mine is about 10 feet wide. There is ore in sight to keep forty stamps in operation for two and a half years. The pumps are run by electricity, as will be the mill. The gravity system on the tramways is a success in every detail. The company has its machine shop on the ground and builds cars and other articles used in the mine. The entire plant is a model from top to bottom, and the business system that prevails in every department is admirable. The syndicate has expended over $4,000,000 in Butte county mines. Mr. Geo. H. Evans has charge of all the properties owned by the London syndicate and many improvements have been made under his administration.

Oroville, Oct. 22nd, '97.

Mercury: For the first time in fifteen years, or since the big main drain tunnel of the mine was run, eight-hour shifts are being employed at Cherokee. In that part of the mine leased from the bondholders by H. D. Gage an inclined tunnel 7x6 is being run, and by the three shifts is being run ahead at the rate of 250 feet a month. An upraise in the channel is expected to be made by the first of the year. The gravel is raised by a friction hoist run by a 4-foot Pelton wheel under 300-foot pressure. The operations are in the center of the channel of the big mine and will develop the width and richness of the lead clear across the face and the more important fact as to whether this once-famed hydraulic mine can be successfully drifted or not.

Calaveras.

From Milton, the Plymouth Rock mine is sending 200 tons of sulphurets to San Francisco for reduction.

The Innes mine at Mokelumne Hill, owned J. Guiffra, has been bonded by Robinson and Mathews of Oakland for $4800, to be paid on or before Jan. 13, 1899. The 10-stamp mill is ready to run. The shaft has a depth of 65 feet. A tunnel has been driven 150 feet. Power will be obtained from the Mokelumne and Campo Seco canal under 175-foot pressure.

The California Exploration Company has resumed sinking at the Bund mine. They will go down to 425 and crosscut the vein.

It is expected that the Royal mine, near Copperopolis, will shortly change hands. The prospective purchasers intend to greatly increase the capacity of the plant and work the mine on a much larger scale.

At the Trilby gravel mine, San Andreas, Supt. Pennell has begun pumping.

The J. R. mine at Old Gulch, owned by John Ballard, has been shut down.

El Dorado.

Nugget: The pay shoot has at last been struck at the Larkin mine. C. H. Dunton is the superintendent.

The Grand Victory mine at Fall creek has suspended work for the season.

Kern.

The Pine Tree mine is being run day and night, giving employment to forty men.

The Randsburg Placer and Quartz Mining Company owns 320 acres of land near Randsburg, under which placer gold is believed to lie in great quantities on bedrock. The company's shaft is down 175 feet and is near to the bedrock.

Nevada.

The *Union* says the Allison Ranch mine is to be developed by Mackay & Flood. A good sized ledge of ore which will go $100 to the ton has been discovered in the 400 level. It dips to the south and it is an entirely new ledge.

The *Union* hears that a 10-stamp mill will be erected at the English Mountain quartz mine above Graniteville, to take the place of the one destroyed by fire this year.

Transcript: The Mayflower mine is being worked steadily now and at a profit. About twenty men are kept busy—some on day's pay and some on tribute. Last week a big bar of gold came in from there, and it only took a part of it to pay the expenses of production. After Messrs. Hayward & Lane gave up their option on the property nearly two years ago, it stood idle a very short time. The original owners, who felt satisfied that it was all right if properly opened, went to work with a vim and discovered new and valuable ore bodies that the bonders had missed.

Plumas.

(Special Correspondence).—Carter & Owens are developing a property on Rush creek, eleven miles west of Crescent. They have a tunnel 200 feet long which taps the ledge at 100 feet. The ledge is 7 feet, and fifty-seven tons of the ore yielded $17.50 per ton. The formation is slate and porphyry. They have five claims. The works are on a mountain side; the bottom of the canyon is 5000 feet below them.

G. P. Cornell & Co. have bonded fifteen claims, together with the Green Mt. mine, to a syndicate. There is a 60-stamp mill on the property. The company has begun extensive development work and is also reopening and retimbering the old tunnels.

The Crescent has a 32-stamp mill which is idle. The greatest depth attained on this property is 400 feet. This mine for a number of years produced from $7,000 to $11,000 per week. It is owned by San Francisco people.

Crescent, Oct. 17th, '97.

(Special Correspondence).—The McGill & Standard mine, two and a half miles from Greenville, is running fifteen stamps, but no concentrators. A party works three arrastras on the tailings, over a mile from the mill. The ledge runs from 2½ to 20 feet. The property in seven years netted $150,000.

The New York, owned by Mrs. Trelevan & Sons, has just completed a 5-stamp mill. The property has been in litigation for some years, which was settled recently. There are five claims. The ore will average $5.

Greenville, Oct. 18th, '97.

(Special Correspondence.)—The Excelsior Gravel Mining Co. is prospecting extensively six miles from Longville, at the junction of Yellow and Grizzly creeks. A tunnel 150 feet tapped a 500-inch flow of water. Another tunnel, 27 feet lower, is 275 feet, from which a 40-foot incline again encounters water. Pumping and hoisting machinery is being placed and will be ready for operation in another week. The gravel on the rim was quite rich. The owners live in Plumas and Modoc counties.

Patrick McGovern, working on Chips' creek, twelve miles south of Longville, found among other pieces running from $7 to $30, a nugget weighing $140.

The miners on many of the interior creeks are leaving their "diggings" on account of the snowfall, to resume work about May.

Longville, Oct. 19th, '97.

Riverside.

Recent assays of O. J. Ellsworth's mine in Hemet valley show $26 gold per ton. The ore is said to be 26 per cent zinc.

Virginia Dale placers are said to be producing about $1000 per week, with fifteen men at work. Some are not doing well, says the Redlands *Citrograph*.

A paint mine is being developed, the *Press* says. The mine is two and a half miles from Alvord. The supply of the paint rock is practically limitless. The colors being taken out are yellow ochre, chrome green and red. At Jackson's mill forty tons of the pure material are ground per day.

San Bernardino.

The Rose Cyanide Company has incorporated in San Bernardino to work over the tailings of the Rose mine in Holcomb valley, of which there are from 10,000 to 12,000 tons that it is said will go from $5 to $6 per ton; the mill is turning out twenty tons per day. The company will put in a plant capable of handling fifty tons per day. W. W. Burton, J. H. Playter, F. M. Gallaher of Santa Barbara, and G. P. Brown of Mercur, Utah, constitute the company.

San Diego.

Receiver Pauly has filed his report as receiver of the Golden Cross Mining and Milling Company at Hedges. On July 7 last he took charge as receiver; there were 160 men in the employ of the company and fifty stamps were in operation in the 100-stamp mill. On August 10 the number of stamps was increased to seventy, on August 20 to eighty, and on September 13 to ninety-five stamps, and the number of men to 177. The 40 stamp mill has also been placed in good condition. When Receiver Pauly took charge a cleanup of the batteries realized $10,417.47. There was at that time $9169.69 due the employes, which was paid, leaving a balance of $1277.78. A cleanup on August 1 realized $17,498.46, the cleanup on September 1 showed $37,581.94, and another cleanup on September 30 realized $31,233.84. He has paid out altogether for the benefit and operation of the property $48,-117.07, which does not include the September pay-roll, not yet due. There is on hand and in bank the sum of $50,239.65. All receipts since Receiver Pauly took hold on July 7 amount to $98,356.72, showing a profit for the three months of about $50,000. The report shows that the net earnings are increasing and that large bodies of free gold ore are in sight.

The report comes from Gold Rock that that camp is in a most flourishing condition, more so than ever before, according to the Yuma *Sun*. A large quantity of ore is being gotten out, and the forty stamps which were shut down some time since will be started up on the first of the coming month, and the entire 140 stamps will be kept pounding day and night.

Shasta.

Some weeks ago considerable attention was attracted by the discovery of gold in paying quantities existing in large boulders lying near the Cinnabar, Castella trail, in Shasta county, and search has been going on ever since for the ledge or source of the gold-bearing rocks. It is now claimed that the ledge has been found. The Redding *Free Press* says it is 3 feet in width and is composed of white and rose quartz, carrying gold, silver and copper. The ore assays from $12 to $32 in gold. No assay has been made of silver, but the ore carries 20 per cent copper. The ledge has been uncovered for a distance of 22 feet.

The Diestlehorst dredger in the Sacramento river, near Redding, has been closed down temporarily. Work will be resumed Nov. 1st.

Free Press: On Wednesday morning all of the smelting furnaces of the Mountain Copper Company at Keswick were shut down temporarily, and men laid off to await the completion of a flume in course of construction which will materially increase the water supply. The company is rushing the work of rebuilding the buildings at Iron Mountain which were recently destroyed by fire.

The Mt. Shasta mine, two and a half miles west of Shasta, owned and operated by Behrens & Levisay for some months past, has been sold for $10,000 to Hirschly, Vair and Farfst of San Francisco. Behrens & Levisay have been shipping ore from this mine to the Keswick smelter, the value ranging from $80 to $90 per ton on an average and none of it going under $50. Very little development has been done. An open cut for 40 feet has been made and a shaft 80 feet deep sunk. The ledge averages from 18 inches to 2 feet.

Sierra.

The Pioneer Reduction Company is making a practical test of 400 pounds of concentrates from the Sierra mine, above Downieville.

Enterprise: Last Sunday the Sierra Gold Company cleaned up in free gold from their mine on the East Fork $232, the result from fifty tons of ore run through the mill. The ore besides runs high in sulphurets, which will yield not less than $4 per ton.

Siskiyou.

Journal: All of the hydraulic mines on the lower Klamath are awaiting the fall rains before they can start up again. Many of them, which are usually worked nearly all summer, have been closed down for over two months past, as nearly all the gulches and streams which carry a supply of water are almost dry now. Much of the land on the lower Klamath adjacent to the river will be mined during the next year, as the new companies which are putting in plants in that section have secured quite a large acreage. The Klamath river, below the mouth of Scott river, has cut its way through the northern end of the Coast Range and nearly at right angles to its trend. It runs through a rather narrow canyon from a few hundred to several thousand feet deep, and slopes as steep as the material, whether rock or earth, will stand, and which are clothed with a dense growth of timber and brush. At Hamburg Bar, Happy Camp, Orleans Bar and a few others places on the river, the mountains recede far enough from the stream to admit of a few acres of level land being farmed. Gold is found wherever the river has deposited gravel, whether it be in an old channel 1000 feet above the present river or in the bottom of the stream. The formation throughout this region is blue black slate of great thickness. The Klamath is one of the richest streams in the State, and has been yielding large quantities of gold for over forty years.

Trinity.

The water is all pumped out of the Altoona quicksilver mine at Cinnabar, in anticipation of starting up the mine on a large scale.

Graves Bros. have $800 in gold nuggets, recently taken from their Blue Jay mine.

The Brown Bear mine at Deadwood comprises thirty quartz claims, two placer locations and 600 acres of timber land. The amount of underground work is equivalent to twelve miles. The mill contains fifteen stamps and three vanners. The walls are granite, slate, porphyry and quartzite. The mill has been in continuous operation for fifteen years. They are now working on the 600-foot level. This is the deepest mine in Trinity county. A peculiarity of the ore is that if ore pays at all it pays well, but if poor there is practically no gold in it. Over $6,-000,000 has been taken out of this property. The mine is owned by Chas. Mott of San Francisco, Jno. Milton of Placerville, Mrs. M. E. Phillips of Oakland and Chas. Dobler. The clorination works are owned by McDonald and others and are not in operation. The sulphurets are sent to Selby.

The *Searchlight* hears that the owners of the Altoona quicksilver mine will drive a two-mile tunnel to drain their mine. The cost of pumping the works clear of water is a heavy item of expense, and one that will continue to increase as greater depth is reached. Recently, when the mine was flooded, this long tunnel was fully considered, but the company did not like the idea of the mine lying idle while the tunnel was under way, and a pumping plant was installed, with a battery of three boilers.

The Nash placer mine on Coffee creek, sold three years ago for $25,000 and now in the hands of an English syndicate, has made recent improvements. A tunnel has been completed which puts the mine in readiness for the winter rains. Another tunnel 10 feet square has been driven 550 feet. Through this tunnel a 6-foot flume, with ample fall, carries the debris into Coffee creek. The pay dirt is hydraulicked into the tunnel and over the gold-saving apparatus in the flume. The company has constructed seven miles of ditches and is in shape for a season's run.

Tuolumne.

The Sonora *Democrat* says the miners employed have attached the Green mine for wages. The miners say they know that every ton of rock run through the mill paid handsomely, and that in a very few shifts they can crush enough to pay off all the hands, consequently they think something is wrong that they are not paid promptly.

David Neagle and associates have purchased the Carlotta mine near Cherokee for $10,000.

Sonora *Democrat*: Several years ago the mineral industry of this county was practically dead, but the inevitable favorable reaction came and Tuolumne is now one of the greatest ore producing districts in the country. More mines are weekly being added to her already long list, and thousands of dollars worth of mining machinery is coming in right along. Any prospector with a reasonably fair price of quartz vein within a radius of twenty miles of Sonora can cash it for a few thousand dollars, while rich is the man who can show a legitimate milling proposition that gives reasonable returns on rock run through a mill. With the advent of winter and water mining will receive an impetus in this county.

A Sonora dispatch says last Saturday afternoon the Birney Wainwright Monroe mine at Bald mountain turned out a pocket of $6000, with more in sight. One piece of gold contained $600.

Yuba.

At the Good Title Company, Indiana Ranch, the machinery for the new mill and hoisting plant has all been delivered and the mill is in operation. Of the assessment of $30,000 levied to construct a mill and new hoisting works, every dollar has been paid.

NEVADA.

Carson *News*: The big concentrator at Gloconda is nearing completion. The building has been finished and the machinery is being rapidly placed in position. It is the biggest plant of this kind in the State.

In Esmeralda county, along the line of the Carson & Colorado Railway in the White mountains, is a deposit of diatomaceous earth, the excavation of which is likely to become an important industry. The substance is white, appearing from the cars like a huge bank of snow. It is composed of 92 per cent pure silicon and is so light that thirty-three sacks are required to make a ton. There are many acres of the material and excavations to the depth of 30 feet have failed to find bottom, indicating that the supply is almost inexhaustible. This substance is fireproof and is being used as a substitute for magnesia in the manufacture of plaster and asbestos covering for boilers and steam pipes. A company has been organized in Pennsylvania to manufacture the latter product from the Nevada mineral. There have been similar deposits found in other States, but never in such pure condition, and as its field of usefulness is widened the owners of the deposit, Messrs. Yerington, Laws and Knapp, will find that they have a "gold mine" on their hands. It has been found that the Nevada silicon will answer every purpose of the magnesia and can be laid down in the East at less than half the cost.

OREGON.

The price paid for the Forest Queen group of mines at Cornucopia was $75,000.

J. W. Cook, superintendent Music mine, Bohemia district, Lane Co., reports that the 5-stamp mill which has been running steadily since the middle of May up to October 1 cleaned up $30,000 in bullion and concentrates.

The bonding of 3000 tons of tailings owned by Hicks & Co. of the Ashland quartz mill to Caldwell & Ingalls entails the erection of a cyanide plant to work the tailings.

WASHINGTON.

A German syndicate has purchased thirty-three mines on the west side of Troublesome creek, within seventeen miles of Index. The deal is said to have involved $100,000 as the purchase price, and the Great Northern spur may be constructed from Index to the properties.

BRITISH COLUMBIA.

(Special Correspondence).—The Morning Glory Mining Company is the only one that has put in any machinery. A 5-stamp mill will soon commence work. The assays show from $7 to $13 gold and $3 silver on one ledge; on another the result given was $4.20 in gold. The formation is dyrite.

The Densy Mining Company's property partly overlaps the Sarah, the same ledge having been traced some distance into the Densy, from which equally good results are expected.

The Bon Diablo Mining Company's property lies 3½ miles northeast of Vernon. It consists of a group called respectively the Bon Diablo, the Smiling Tom and the Red Rover. The assays show $244 gold and $2.80 silver. Several ledges traverse these claims. Shaft No. 1 faulted at 35 feet, when a tunnel was drifted in 75 feet, running through highly mineralized rock. Ledge No. 2, about 8 feet in width with well-defined walls, has given $155 gold.

The Camp Hewitt Mining and Development

Company's property is fifty miles south of here, on Okanagon lake, and consists of a group of claims of which the Gladstone appears to be the favorite. Very good ore is brought from the claims and several ton shipments have been made to the smelter. Considerable work has been done on the Gladstone and arrangements have just been completed for a gang of men to be put to work for the winter.

The Ruby Gold Mining Company is on the lake near the Morning Glory's property and consists of a group of twelve or fourteen claims. No work is being done now.

The Silver Star Mining Company's property is fifteen miles northeast and is rich in galena. Sinking is discontinued, awaiting pumping apparatus.

Vernon, B. C., Oct. 22d, '97

A Kaslo dispatch says the largest dividend in the history of the Whitewater mine was declared last week, $24,000, a total to date of $64,000. The Whitewater is shipping at the rate of fifty carloads per month.

The Slocan Star declared a dividend in September of $50,000, a total of $400,000. The mine is shipping concentrates again over both the Nakusp & Slocan and the Kaslo & Slocan roads. The Slocan Star has shipped 1455 tons of concentrates in the last ninety days.

The annual report of the British Columbia Board of Trade, just issued, gives the following:

VALUE OF MINERALS PRODUCED, 1895 AND 1896.

	Value.	*Value*
Gold, placer	$ 481,683	$ 544,026
Gold, quartz	785,271	1,244,180
Silver	977,229	2,100,689
Copper	47,612	160,926
Lead	532,255	721,384
Coal	2,818,962	2,327,145
Coke	2,380	3,075
Other materials	10,000	15,000
Totals	$5,655,302	$7,146,425

"The output of gold and silver during 1897 will show a great increase over 1896, Kootenay alone yielding more by one million than all the rest of the province last year. It is a conservative estimate to say that, excluding Klondike, British Columbia will yield over $10,000,000 during the current year, and that during the next four or five years the increase will average from three to five millions yearly."

ALASKA.

(Special Correspondence)—The following, dated St. Michaels, Oct. 9, is from "Alex. Quartz," an old correspondent, who traversed the entire Klondike region in '88:

After a stormy trip of thirty days we arrived here on the steamer Navarro with the river steamer Thomas Dwyre in tow, October 2d, and found five vessels anchored in Norton bay, off St. Michaels.

Nearly all of the expeditions that have reached here so far this season have been a failure, owing to the projectors being unable to carry out their contracts with the passengers. All of the boats they have brought here to ply upon the Yukon river draw too much water and are lacking in speed to stem the current in the rapids of the river. Parties coming by this route next season should be sure and know that the company who furnishes transportation to them has light draught and high speed boats to take them up the river; otherwise they will be stranded in the river or here at St. Michaels, with no way to proceed further except at their own expense, and that means a small fortune if they have an opportunity to proceed at all. It is almost impossible for any number of men who are stranded here by those expeditions that are failures to get passage up the river, for the reason that all the boats that are capable of navigating the river are overloaded with passengers and freight brought by their own ocean vessels. I would advise all those who intend coming by this route next season not to be deceived by cheap rates of promoters of expeditions which have not the necessary facilities to take them up the Yukon without delay. Better by far for them to pay $200 or $300 more and get to their destination than to come on cheap rates and be stranded here or at the mouth of the Yukon.

There has been no boat nor passenger got any further up the river this season than Fort Yukon, this side of the American line, since July 26th; and there are now over 200 people, stranded in the river in boats and here at St. Michaels, that are unable to get up the river. A large number of them would gladly go back to San Francisco if they could. The Mare Island, towed up here by the North Fork, with about 100 passengers on board, left here nearly three weeks ago, but stuck in the mud and ice in the mouth of the river, came back a few days ago and is lying here in the bay as useless as she would be if she was out on the desert. She draws about 7 feet of water, and the water at the mouth of the river is only 4 feet deep in the latter part of the season. They are a most discouraged lot of passengers, with all their golden dreams blighted. Thirty-seven of them are going back on the Navarro in a few days. They tell me they are fed twice a day on the poorest kind of fare and are huddled together like a band of sheep. At the Devil's Finger Rapids, up near Fort Yukon, there are only 18 inches of water, and no boat nor provisions has passed there since July 26th, and, as a consequence, provisions are getting very short at Dawson and along the upper Yukon. All whom I have seen so far who have come down the river since then say that the most of the people will have to come down the river 400 miles to Fort Yukon, to where the provisions are, or starve this winter; or, in other words, Dawson will have to move to Fort Yukon till next summer. Any person who comes here without at least one year's provisions and proper clothing and a couple hundred dollars in cash is inviting slow suicide.

The following is a list of prices for an inferior quality of provisions, etc., here at St. Michaels, and this is the cheapest point in Alaska to buy goods: Flour, $16 per barrel; bacon, 20 cents per pound; ground coffee, 50 cents per pound; tea, $1 per pound; chocolate, 50 cents per pound; beans, 10 cents per pound; oysters, 50 cents per small can, picks and shovels, $2.50 each; baking powder, $1 per one-pound can; potatoes, 10 cents per pound; onions, 15 cents per pound; 44-cal. Winchester cartridges, $2.50 per box of 50; 45-cal. cartridges, $5 per box of 50; and so on down the list. So those who intend coming this way next season should provide themselves well with an outfit before starting. The cheapest board here is $3 per day, and no employment for strangers. The town consists of two stores, owned by the Alaska Commercial Company and the North American Transportation & Trading Company, their buildings for their men including two hotels; the Mission Catholic church and the houses of the Mission Indians. There are also a large number of native huts scattered all over the point between the stations of the two companies.

The latest news from men who arrived here from Dawson yesterday, and who are on their way to San Francisco, is that the people in Dawson have been ordered to leave for Fort Yukon, where the supplies are. I have just interviewed one of them and he tells a woeful tale of hardships in the Klondike region, and although he said he was not one of the fortunate ones he asserted that half the richness of that region has not been told. So say they all who have come from there this season. From the most authentic information at hand, and it is considered reliable here, it is estimated that there is at least $5,000,000 stacked up at Dawson awaiting transportation down the river, and $30,000,000 more in sight in the dumps and in the process of washing. This seems like a feverish statement, but when the lowest estimate is placed at those figures by the most conservative men who come from there, as well as the people here who are posted, we have to accept it as truth. There is no excitement here and things go along in as placid a way as they do in a California town. Still, I have seen enough since I've been here, gold included, to convince me that the Klondike region is not a golden dream of the fevered mind, but a reality, and I will say that it is beyond a doubt the richest country in gold on earth, and also the most vast in extent. There have been some rich discoveries made all along the Yukon and its tributaries within the past two months, but development work in those new districts has not yet progressed far enough to prove whether they will become rivals of Klondike or not. Minook creek, Sucker creek and Hoosier creek, on the west side of Fort Yukon, are all promising districts, and a report reached here to-day that one man took out 115 ounces in one day from a claim on Minook creek on reaching bedrock. Some new discoveries are lately reported within 200 miles of St. Michaels here, but I have not yet learned the exact locality of the new district. Gold is reported to exist in every stream tributary to the Tawana river, and it is considered by all to be the coming country. But little is known of this river, as its headwaters have never been explored and but little is known of any part of the river above fifty miles from the Yukon. I am told here that it is navigable for 275 miles from the Yukon and is a better river, without shoals or rapids for 250 miles, and is well timbered. It flows into the Yukon from the southeast 700 miles from its mouth and is estimated to be between 800 and 900 miles in length. It is the largest tributary of the Yukon river.

Our boat, the Thomas Dwyre, is the only boat that has been brought here this season that is fitted and suitable to ply upon the river. She is 65 tons register, 80 feet in length, with a speed of 12 miles per hour, and only draws 30 inches of water when loaded.

We leave here to-morrow for the mouth of the river in the hope of getting in. A priest from here is going as pilot. He knows the river and thinks our chances good to get in. Although the slush ice has blocked the mouth of the river for twenty miles for the past ten days, we have had a thaw with southeast wind for the past two days, which they claim has cleaned the river at the mouth of ice, and once in the river, it is open for some 400 miles. If we succeed in getting in the river we will go up 150 miles to winter quarters at timber and safety, and remain on the boat all winter, and will get up the river on the boat at least a month earlier than it is possible for a boat to get in from the outside, for the mouth of the river doesn't open for navigation until the middle of June at the earliest. If we fail to get in to winter quarters in the river, then the boat will come back here and winter, and in that event I will take Indians and dog teams and make the portage of 200 miles over to the Greek Mission, near the mouth of the Tawana, in November, when the deep snowfall occurs.

Twenty one out of the twenty-three passengers on board are bound for Dawson City. Several of the passengers want to make the portage with me in the event of our not getting in the river, but I have refused to allow them to accompany us, for they are inexperienced in traveling in this ice-bound region, and if they went would be walking into the jaws of death; and if we would tarry to assist them it would mean death to us also. The Indians we have engaged to go refuse to start should we allow them to follow my partner and myself. The thermometer has been below the freezing point ever since we came here, until yesterday morning, when the thaw began, and since then it has been like early spring weather in California at an altitude of 3000 feet.

This goes out on the last mail from here this season, so we will have no opportunity to forward any mail or receive any until next February or March. Those who are stranded here on those steamers that are caught in the river away from suitable winter quarters are to be pitied, especially where they are remote from timber to build cabins with, for they will find it a hard task to keep from freezing even though they save their boats from destruction by the ice. I would not care to change places with the passengers who are going to remain on the steamer Mare Island this winter. There is no fuel here except driftwood, which is brought from along the coast of Bering sea, and it is waterlogged cottonwood, and next to no fuel at all, as not even a shrub or bush grows within miles of St. Michaels. I hope to have some important news for the readers of the MINING AND SCIENTIFIC PRESS when you receive the next letter from me and be able to give reliable information regarding the geology, geography and resources of the country, with a description of the best routes for the pilgrims to come by who intend braving the dangers of ice and frost for the treasures they hold.

BERNERS BAY DISTRICT.

(Special Correspondence).—The Nowell Co.'s 40-stamp mill at Seward is running full time on good ore from the new strike in the Kensington mine. Development work in this mine is opening up good ground and so far this is the largest high-grade ore deposit found in Alaska. Over 30 feet wide will mill $50 per ton.

The Portland Alaska Mine Co.'s 10-stamp mill is running steadily on medium ore from the drifts.

The Jualin Co.'s 10-stamp mill has been busy all the season on good rock. This is one of the best little mines in Alaska, a regular profit every month. This company will ship this winter all the concentrates that they have accumulated during the past year.

The mines of Bok & Co. have been bonded (rumor says $150,000). Development work that has been done this year showed that the ore bodies are large and very high grade. The parties bonding have men at work opening up the property.

Seward, Alaska, Oct. 1st, '97.

Alaska *Record*, Oct. 13th: About 120 miners came down from the Cook inlet section on the Dora, most of them passing through Juneau on the Topeka en route to ports below. Considerable gold was taken from the placers in that district this year, or in the neighborhood of $250,000. The Polly Mining Company cleaned up about $160,000. Next year this company will put in a hydraulic plant and work their ground on an extensive scale. They are located on Mills creek.

THE KLONDIKE.

The method of locating a placer claim is simple. There are numerous small streams or creeks running through narrow valleys. The prospector must not exceed 100 feet up and down the creek, the general course of the valley. The width of the claim can run from base to base of the hills or mountains. If there are no claims located on this particular stream, the claim is known as the "discovery claim," and the stakes used are marked O. The next claim staked up the creek is marked No. 1, as is the next claim going down the stream. There can be but two claims marked No. 1 on any one stream. The four stakes being driven and each marked with the initials of the locator, and the letters "M. L," which means "mining location," the miner must bound his claim with cross or end lines, and then proceed within sixty days to file the claim with the government's recorder at Dawson City. In recording affidavits must be made that the claim is properly staked, the date given and the gold that has been found. The number of the claim must also be given, and if it is not the discovery claim it must be mentioned as for instance, No. 1 or No. 10 above or below "discovery claim," as the case may be. If a claim should be staked before gold is discovered thereon, the prospector has sixty days in which to prosecute the search for gold. If when this time has expired, he is yet unsuccessful, he can no longer hold the claim, as the finding of the metal is absolutely necessary for the holding of the claim.

When a Klondike prospector has staked out his claim, which must be as near water as possible, and generally about 100 feet in length, he makes an experimental panning as a test of the claim. This may show very little at first, but when it is considered that five cent dirt—that is, ground that washes or pans five cents' worth of gold to the pan—is paying property, it may be seen that the miner's standard is not so very high. Many cases have lately been reported from the Klondike where the dirt has washed out $50 to the pan. With a claim of five-cent dirt the miner, if he is industrious, may be reasonably sure of $50 a day. With $50 dirt he is a millionaire, if his claim is of any considerable extent.

The testing of a claim is, however, only the beginning. After it is proved to be worth working, it is necessary to prepare for more extensive operations. The first thing is to make the sluice boxes. In the Klondike lumber is a scarce and very expensive article, provided it is purchased all ready for sluice purposes. If the miner is industrious, he will fell enough trees from the thousands that cover the rugged lands about to make him all the sluice box lumber that he will need. It is much more economical for him to put in the time and labor necessary to do this than to buy the lumber ready made.

When the lumber is ready it is converted into sluice boxes of whatever length the miner may deem advisable. The boxes are then placed in position, and all is in readiness for the washing process. Now comes the necessity of getting the dirt into the boxes. It is always the case that pay dirt—dirt containing gold—lies next to rock. This being the case it is necessary to clear away the gravel that lies between the surface and the pay dirt. It is a laborious task in any event, but when one has to face Klondike seasons, it is still more difficult.

Sometimes it happens that as much as 25 feet of gravel must be removed before pay dirt is reached, and when most of this has to be done within sixty days, besides washing out the pay dirt, the necessity for hard work is apparent. As a rule, the depth of the surface gravel is about 8 feet, and at this depth it is possible for the miner to get his pay dirt and wash a good bit of it in one season. Many of these who are on their way to the Klondike cherish the belief that all the miners do when they pan out gold is to dig out a surface lode and make all the money they want to. On the contrary it is often necessary for a miner to spend the entire season in clearing away the surface gravel from the pay dirt on his claim.

The statements often made that it is impossible to do any work during the winter season are erroneous. Nearly all the tunneling is accomplished at that time of year. Fire is the agent by means of which the tunneling is done. There is plenty of wood to be obtained, and so the miner builds a roaring fire next to the gravel which he wishes to tunnel. Naturally, this melts the frost out of the gravel, which is then shoveled out. This method does not prove successful with surface gravel.

Occasionally it happens that a claim is too far from water, and in such cases several fortunes have been rocked out — that is, rockers have been used. The rocker is just what its name indicates. The dirt is placed within it and it is rocked until the dirt and gold have been thoroughly shaken apart. The system is used only on rare occasions, for, as a rule, water is sufficiently plentiful to make the ordinary methods of placer mining available.

IDAHO.

At Burke, the Tiger has resumed sinking again. It is not necessary to keep sinking all the time, for the ore chute is 1300 feet long, and the shaft can be sunk much faster than the ore can be mined for such a distance. The shaft is now 1325 feet deep and will continue to 1400 feet.

The Surveyor General's office at Boise has been crowded with applications for surveys and mining patents this quarter more than for any quarter for the past ten or twelve years. Applications have been received for nearly eighty different claims. Of this number twenty-five come from the Bunker Hill and Sullivan mines in the Cœur d'Alene country, and sixteen from the Hailey district. De Lamar and Warrens supply most of the remainder.

At Florence the Banner mill is daily reducing eighteen tons of ore, the Ozark twelve, the Waverly six. These three companies employ forty-five men at an average of $3.25 per day. Capt. N. D. Moore of the Florence Mining Company has bought the 5-stamp mill formerly used by ex-Governor Willey on the old Knott mine, at Warren, for removal to the Blossom mine. The Waverly Company has a new mill on the way, which will be erected on the Waverly mine. The new mill for the Hi-Yu will be in operation in a month. The Poorman Company has ordered a mill for its property; it will not be operated till spring. The Gold Bug, Toledo and Cumberland will be worked all winter.

The Bedrock flume property of Idaho City has been sold to Col. Souther of Boston for $36,000. It takes in seven miles of the bed of More creek, beginning at Idaho City, the claims embracing about 1000 acres.

The growth of Florence camp is illustrated thus by the Florence *Miner*: "The winter of 1893-94 only five men wintered in the camp; in 1894-95 fifty men wintered here; in 1895-96 about 150 men wintered here, and this winter there will be about 1000 men employed and wintering here."

MONTANA.

The Montana Ore Purchasing Co. proposes to increase its capital from 40,000 to 100,000 shares, or from $1,000,000 to $2,500,000, par $25. The object of the increase is to enlarge the capacity of the smelting plant and acquire new properties and develop claims now owned. The meeting is called for Nov. 6th at Butte.

The Anaconda Mining Co. at Clark's Forks will erect large works and mine coal extensively. There will be 4000 men employed, and the expected output will reach 3000 tons of coke daily.

Sheridan reports that F. J. Lyons has interested Michigan men in his Toledo smelter and that within a short time the present plant will be torn down and a new 60 or 100-ton plant will be constructed.

The report of the directors of the Montana Mining Company regarding the Drum Lummon mine for the half year ending June 30, 1897, shows that during the six months the total yield in bullion bars and concentrates (on assay coinage valne) was $175,975. Of this $76,556 was contributed by the cleanup of plates, etc., and $99,419 by 6,820 tons of ore reduced by the 50-stamp mill during May and June. The actual realized and realizable value of the produce amounted to $151,382, the difference on the coinage value being $24,593, or 1.09 per cent on the gold, and 60.23 per cent on the silver produced. The 60-stamp mill was shut down for the whole of the half year and the 50-stamp mill was in operation only during May and June. The developmnet of the mine during the half year consisted of drifts, winzes, crosscuts and upraises, representing a total progress of 4,233 lineal feet, at a cost of $64,889. During the month of May, the connection between the 1200 and 1600 feet levels, south of shaft No. 2, was completed, thus ensuring safety and better ventilation in the mine.

Inter-Mountain: The Chicago capitalists who invested money in plants for the extraction of gold from the bed of Grasshopper creek near Bannack are now reaping the reward of their enterprise. Three boats or dredges have been in operation this summer and the returns have been so satisfactory that a London company is now placing machinery on the ground for another boat next summer.

It is not more than four years ago since some Montana men succeeded in enlisting the attention of a few capitalists of Chicago to the fact that the old river bed, which has been worked in the primitive way by the early gold seekers, was rich in gold. Everybody knew the gold was there, but it was

difficult to get at. Finally some one hit on the scheme of a dredger. The old mossbacks laughed at the idea. It was from 30 to 50 feet to bedrock, the river bed was filled with boulders, and it was considered an impossibility to devise machinery to handle the gravel. A boat or dredger was built, but it was not successful. The machinery was defective. The next year another effort was made with new and improved machinery and the success of the enterprise was assured.

"The Gold Dredge Company has a Klondike of its own at Bannack," said Deputy Mine Inspector Frank Hunter, who returned from an inspection of the mines of Beaverhead county Saturday. "This company has two boats or dredges in operation and employs about thirty-five men. One of the boats is operated by steam and the other by electricity. Each boat cost about $40,000. The electric dredge is the least expensive to operate, the expenses being some $75 or $100 a day less than the boat operated by steam. The power is derived from a ditch several miles in length, the electricity being generated at Bannack and transmitted to the dredge.

"The boats of the company are able to handle from 1500 to 2000 cubic yards of dirt each day and the gravel will average about 40 cents to the yard in coarse gold. No section of the now famous Yukon ever produced such handsome nuggets as I have seen taken from the bed of Grasshopper creek. Near the town of Bannack bedrock is reached at a distance of 30 to 40 feet, but down the creek bedrock is generally found at a depth of about 45 feet.

"The Chicago Mining and Development Company has one boat in operation having a capacity of handling from 1200 to 1500 cubic yards a day. The boats begin operations early in April and continue in operation until early in November. There is lots of working ground below the town and it is likely that next year there will be several more dredges at work. The London company will operate four or five miles down the creek from Bannack. I have been told that as high as $2,000 in gold has been cleaned up in two days by one of the dredges now in operation."

SOUTH DAKOTA.

Deadwood reports that the bottom of the body of ore in the Hardin shaft at a depth of over 200 feet has been reached and shows a thickness of 22 feet that will average $50 a ton.

COLORADO.

(Special Correspondence).—Gilpin county is one of the busiest districts in Colorado and there are good grounds for the prediction that the year's production will be approximately $5,000,000. Every mill in the district is running and all have as much work as they can do. The mills and concentrators are treating 20,000 tons per month and not less than 5000 tons per month are shipped direct to the smelters. The ores of the district, which are a sulphide of iron and copper, partially oxidized, carry gold values principally, there being low values in silver. The mills all use stamps for crushing and have amalgam plates on which a saving is made which varies greatly, according to the kind of ore. They all use concentrating tables, by means of which a large per cent of the saving is made. About 730 stamps are now dropping in the district, besides the large concentrating mill, which will handle 1500 tons per month.

The Gettysburg shaft has reached a depth of 675 feet and has been working several months. Some material has been shipped from it which ran 12 ounces in gold to the ton. It is said to be producing $5000 per month.

The Robert Emmett is putting down a double compartment shaft, 4x8 feet, with Cornish sets. New machinery has been put in. Shipments from this property are said to have run as follows: Nine to 25 per cent lead, 7 per cent copper, 1½ ounces to 18 ounces gold and 8 ounces silver. W. H. Nicholls is superintendent.

A. J. Trimble, an iron operator from Duluth, is associated with W. H. Knowles in a bond and lease on the Holland and Homestake in Russell Gulch. These are partially developed and produce high-grade ore. Contracts are out for new machinery on the Holland.

The Vendome Company, operating a large mill and a group of mines, is putting up a tramway 700 feet long from their mines to the mill. The Vendome is handling 1000 tons of ore per month. This property has been worked for the past fourteen years.

The Gold Coin property comprises a consolidation of a number of big properties on Quartz and Gunnell hills, and includes a bond and lease on the Bobtail-Gregory mine and tunnel near Blackhawk. WASCOTT.

Central City, Colo., Sept. 11, '97.

The opposition to the proposed assessment plan of the Boston & Cripple Creek Mining Company is active. It requires a two-thirds vote to carry the plan, which would be 133,333 out of the 200,000 shares. The minority claim that, under the laws of Colorado, the change cannot legally be made. The present charter does not allow of an assessment and the opposition do not relish the method adopted. They will ask for an accounting of the 50,000 shares of treasury stock sold. The shaft is down 220 feet, but not yet in pay ore. The company votes to-day on a proposition to double the capital stock of $200,000 in dollar shares by doubling the par value; also to make the shares assessable. If the plan is carried out, it is purposed that an assessment of 10 cents per share shall be levied, and with the proceeds—$20,000—that the shaft shall be sunk to a point where it is believed that pay ore will be reached. The opposition excepts to this manner of raising money, and has suggested as a possible alternative plan that shareholders contribute stock to the treasury to be disposed of for the advantage of the company. That is another way to levy an assessment. It is not a matter of vital concern to others than shareholders what course is pursued in this matter. It would have been vastly better for the shareholders had a dollar in money been put into the property for each share issued. It is impossible to develop a mine with liquid capital, but a mine may sometimes be "floated" that way. The sort of capital that develops a mine is the sort required at this juncture.

The Elkton Consolidated mine has set up two boilers, each 1000 H. P., to operate the two pumps. Their combined capacity is 1500 gallons per minute. The water must be raised 400 feet. As soon as drained sinking will be continued 200 feet.

The Ophir *Mail* says about $10,000 in retorts was shipped from Ophir last month.

NEW MEXICO.

The *New Mexican*, concerning mining operations around Red River, says the principal mine is the Memphis, on which the new proprietors will spend considerable money in developing. New hoisting machinery has been placed and a mill will be added to the equipment. The mine has a 56-inch lead.

On the Midnight new hoisting machinery is in place at the shaft and a new mill with a daily capacity of from ten to fifteen tons will be ready to treat ores by December 1. The ores in this mine are partly free milling, and the greater part of the values can be saved without concentration. The concentrates will be shipped to the smelters for treatment. Harvey Finch is superintendent.

The Edison has over 400 feet of development work done. A six-ton shipment was recently made to Denver which gave returns of about $100 to the ton.

At Franklin, six miles distant from Red River, the Montezuma Company has large placer claims and several lode mines, and at present are working twenty-five men. The Franklin Company also have placer claims and a townsite.

ARIZONA.

At Rosemont the company has shipped 150 tons of copper bullion carrying a good percentage of gold. About forty men are employed.

The Napoleon Con. M. Co. has incorporated at Prescott, capital stock $600,000; F. V. Layton, G. Pridham, F. S. Munson, to operate in Yavapai county and Randsburg, Cal.

S. H. Gould, superintendent Oro mine, Oro Blanco, says the owners contemplate the erection of a 60-stamp mill within a short time. Thus far 200 feet of tunneling has been put in, and the work has been confined to development. They have opened a body of ore from $3 to $15 a ton.

Messrs. Lewisohn Bros. say the road to Globe City and the Old Dominion mine will be constructed and in operation before July 1.

The Detroit Copper Company will increase the output of its Morenci mines, which have been closed while new and improved machinery is being put in.

The Commonwealth Company at Pearce has canceled its mortgage of $300,000.

Forty men are working in the Golden Wave mine, one and a half miles north of the Congress, and at a depth of 240 feet shows 3 feet of ore similar in character to that of Congress.

Republican: The Copper Queen at Bisbee has reached a depth of 500 feet. The company's payroll at Bisbee is the largest of any in the territory, containing over 1100 names, all of $100,000 being paid out monthly in wages.

The three patent cylindrical roasters are the invention of President Douglas. The distinguishing feature is the fixed central flue which revolves with the fumes and carries the gases, when fuel is used, from the fireplace to the stack, heating by radiating the annular space in which the ore is roasted. This structural peculiarity insures a constant oxidizing heat to ore not otherwise secured in automatic cylinders, the absence of which has here application to the roasting as distinguished from the chloridization of ore. These cylinders are 60 inches in diameter. An average of 32,710 pounds, gross, of ore is treated in a month's time. Average per cent of sulphur going in is 45.1; yield in ore roasted represents but 5.1 per cent sulphur.

Prescott *Courier*: Superintendent M. H. Dodge, of the Gold Basis M. & M. Co., is now prepared for development work on the properties on Groom creek, and immediately have work commenced on a 200-foot shaft and will put up a mill as soon as development justifies it.

Supt. Wm. Johnson of the Gold Cliff at Pearce says all tests made with the cyanide process before the erection of the plant gave the most satisfactory results of any ore that has come under his observation. The ore gave a result of 95 per cent. The capacity of the plant is ten tons daily which will be increased.

MEXICO.

The Copper Queen Company has been granted a concession to erect a smelter at Hermosillo, State of Sonora, the company having deposited a guarantee of $10,000 gold coin to comply with the concession, which carries with it exemption from taxation and special low rates on custom ores hauled over the Sonora Railroad. The plant will treat copper, silver and lead ores.

L. E. G. Carden, H. B M.'s Consul General to the City of Mexico, in the annual report to his government for 1896, has the following report on silver:

"The value of the silver exported in 1896 was, $58,861,692, equivalent to English money at the rate of exchange for that year to £6,315,369, by far the largest amount ever exported from Mexico in any one year; 21 per cent of this amount ($18,253,397) represented Mexican silver coin; the total of the silver coined in Mexico in 1896, being $21,092,397—20 per cent was exported in the form of ores and sulphurets for treatment in the United States, Germany and England, 48 per cent was exported in the form of bars, whether of pure silver or what is known in the United States as base bullion, that is to say, argentiferous lead as it comes out of the smelting furnace, and before it is refined.

"The smelting business in Mexico has made great strides of late years, especially as regards economy of treatment of the ores, and it is probable that each year the amount sent abroad will become less. The remarkable development of silver mining, in spite of the low price of the metal abroad, is in great measure due to the fact that large quantities of ores which were not rich enough to stand the high cost of reduction by the imperfect methods in use in most of the smaller mining camps, can now be profitably shipped for treatment in one or the other of the large smelting works in the central and northern part of the republic. It is scarcely necessary to say that the movement of freight thus brought about, amounting to several hundred thousand tons per annum, has been of the greatest benefit to the railways."

LOWER CALIFORNIA.

The *Lower Californian's* correspondent at Calmalli says: The system adopted by Supt. Swain, of the Ibarra Gold Mining Company of Calmalli, for reducing refuse ores by a new process, is giving very satisfactory results. The new machine is a device invented by Mr. Swain.

The Buenaventura mine, belonging to the same company, is now being worked with twenty men.

Lower Californian: Nothwithstanding the fact that silver is selling at 55 cents per ounce the Taiunfo mines, near La Paz, in the southern district of this peninsula, are still working at a small margin of profit.

While the Triunfo mines are not operated on so large a scale as formerly, about 1000 men are employed at their works and forty stamps are kept continually pounding. The Triunfo group consists of seven or eight mines which have been in process of development for the past thirty years. The shafts have all been sunk on an incline to a distance averaging about 2000 feet, though the vertical depth of the deepest shaft is not 600 feet from the surface. The ore is all raised in cars operated by cables, and there are nine miles of railway in connection with the property.

SOUTH AFRICA.

South African *Mining Journal*, Sept. 18: There have been no very grave fluctuations among the steadier producers. From many points of view, the recent frequency of record outputs is highly satisfactory, as showing that the Rand is really an industrial proposition, and that the industry is doing its best, despite all obstacles, to put out as much gold as possible. But one question has lately troubled a great many thoughtful men. Are these record outputs, under present conditions, quite fair to the shareholders? It does not matter whether a mine be rich or poor—the cost of milling a ton of rock is something in the neighborhood of 30s. The ore cannot run away. Is it altogether fair to its proprietors that so much of it should be milled and cyanided before the reforms suggested by the Industrial Commission have been carried into effect? Even if the reduction were only a shilling a ton, the saving would be immense. The problem is full of difficulties, but the managers of compan es just now are put in a very awkward position. They can only do justice to the mines and to the country at the direct expense of the shareholders. If the Government's share of the profits were applied to any useful purpose, there ought to be some reason for handing them over cheerfully; but since they only go to piratical monopolists—there's the rut.

The Robinson mine's report for August contains the following: Mine—Quartz mined, 14,631 tons. Development—Drives, 780 feet; rises, 405 feet; crosscuts, 226 feet; total, 1411 feet. Mill—Stamps at work, 120; net running time, 29¾ days; tons crushed, 14,631; tons per stamp per diem, 4.1; gold won from above, 10,145 ozs. 13 dwts. Chlorination and Cyanide Works—Gold won from own concentrates (by chlorination), 929 ozs. 0 dwts; bullion from tailings (cyanide process), 3062 ozs. 9 dwts; bullion from slimes (recovered by Rand Central Ore Reduction Company, Limited), 720 ozs.; total from own ore, 14,857 ozs. 2 dwts.; gold from concentrates purchased (by chlorination), 3984 ozs. 16 dwt.; total, 18,841 ozs. 18 dwt.

EXPENDITURE AND REVENUE—Crushed, 14,631 tons.

WORKING EXPENDITURE.

		Per ton milled.
Mining acc't (including mine maintenance)	£ 8,246 8 4	11s 3.27d
Milling acc't (including mill maintenance)	2,495 4 0	3s 4.93d

		£68,545 8 3

AUSTRALIA.

The smelting furnace at the Illawarra, New South Wales, works is in operation and has large supplies of ore on hand, including considerable consignments of gold ore of various descriptions. The blast furnace for copper smelting, made by the Atlas Company, is to be put in position at Illawarra without delay, and Manager Howell believes that copper ore will be forthcoming in sufficient quantity to keep it in continuous blast.

NEW ZEALAND.

New Zealand *Mines Record*: Dredging is becoming a very important factor in the product of gold from this colony, and in Otago especially it has lately attracted a great deal of attention and led to the pegging out of a large number of claims in the vicinity of the Clutha, Kawarau and other rivers. The Roxburgh correspondent of the Otago *Witness* publishes a series of articles, extending over a period of nearly three months, on "The Rise and Development of Dredging in Otago." In concluding (on August 19th) the writer stated that there are fifty-seven dredges working in Otago, thirteen dredges building, and seventy-five dredging claims taken up with the view of placing dredges upon them.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 19, 1897.

592,042.—MIRROR SUPPORT—Bader & Cartwright, S. F.
591,801.—DESK RULER—J. D. Barrie, Los Angeles, Cal.
591,945.—SMELTING FURNACE—F. N. Bergen, Tacoma, Wash.
592,187.—VALVE—A. W. R. Berr, San Jose, Cal.
592,217.—SKINNING KNIFE—O. Bolderi, S. F.
592,131.—RAISIN SEEDER—C. S. Cox, Fresno, Cal.
592,218.—RAILWAY—W. G. urtis, S. F.
592,219.—WOOD CONSTRUCTION—Curtis & Isaacs, S. F.
592,051.—WAVE MOTOR—F. M. Graham, San Jose, Cal.
591,966.—HAIR DRIER—H. V. Halliwell, Tacoma, Wash.
592,091.—VEHICLE—M. P. Holmes, S. F.
592,114.—FIRE DRAUGHT BLOWER AND SCREEN—P. W. Hurndall, S. F.
591,842.—BOTTLE—F. Johnson, S. F.
591,852.—RAILWAY SWITCH—H. C. Lausen, Newman, Cal.
592,203.—WAGON—W. H. Martin, Los Angeles, Cal.
592,050.—TRUNK AND TABLE—C. H. Miller, Los Angeles, Cal.
592,120.—RAILWAY SIGNAL SYSTEM—J. G. Pearce, Oakland, Cal.
592,125.—TIRE—Rogers & Hall, S. F.
592,031.—PIPE WRENCH—G. W. Waitt, S. F.
592,182.—LADDER—C. H. Waterman, Dayton, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

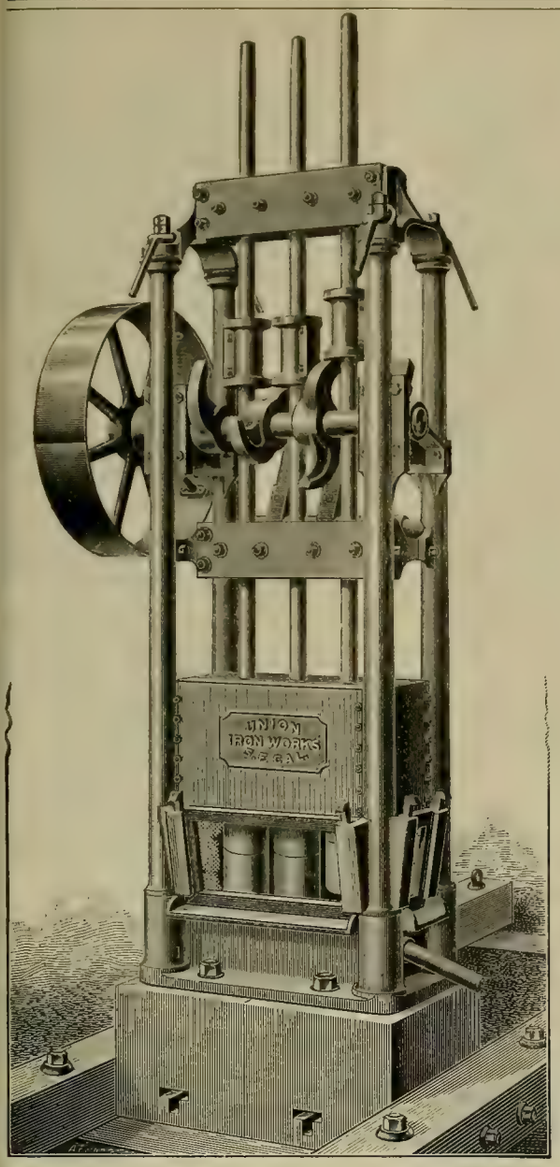
Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VALVE.—August W. R. Berr, San Jose, Cal. No. 592,187. Dated Oct. 19, 1897. This invention relates to a valve which is especially adapted to close and control the passage for any medium under pressure. It consists essentially of a cylinder valve case having transverse inlet and outlet openings and an intermediate valve seat, a valve recessed inside of its periphery, a separate and renewable face secured in said recess being of smaller diameter than the exterior disk, to form a circumscribing space, whereby the transmitted medium exercises a pressure on both sides of and partially balances the valve, and means whereby the valve may be turned, said valve and seat having ports through them adapted to be moved into and out of alignment.

COMBINED AUTOMATIC BLOCK AND SIGNAL SYSTEM AND BRAKE APPLIANCES.—James G. Pearce, Oakland, Cal. No. 592,120. Dated Oct. 19, 1897. This invention relates to a device, the object of which is to guard railway trains from collision by the employment of a series of block signals distributed along the line of railway, these signals serving, first, to show when a train leaves the station at one end and enters the block, and when it arrives at the other end of the block and leaves it, thus continuing to signal its approach and departure at each point of the line over which it travels. This invention has also for its object the application of brakes to any train entering the block from the opposite direction so as to prevent its further progress while the first-named train is within the block, and to similarly apply the brakes to any train following too closely. These operations are effected by means of a series of depressible levers situated at intervals between the rails of the track, and in such positions that they will be successfully acted upon by a drum or roller fixed upon the engine shaft, so as to form contact with these levers as the train passes over them. Each lever is connected so as to operate a mechanism which either sets a signal at "danger" or returns it to the position of "clear." Other sets of levers actuate mechanisms by which the electrical current is successively cut off from these levers which act upon the brake mechanism of the train, so that the train may pass over said levers without being affected. After the train has thus passed these levers, another set of mechanisms are successively actuated to again return the current to said levers and to set the mechanisms already passed over into condition to act on the brakes on any following train which may approach the first train within the danger limit.

ADJUSTABLE FIRE-DRAFT BLOWER AND SCREEN.—P. W. Hurndall, San Francisco, Cal. No. 592,114. Dated Oct. 19, 1897. This invention relates to a device for controlling the draft of fires, grates, and to act as a screen therefor. It consists of the combination with a spring-actuated roller, of a heat-resisting curtain adapted to roll thereon, means for holding the curtain and controlling the coiling of the same, and means for operating the mechanism so as to raise or lower the curtain. When raised, the grate and its contents are fully exposed; the curtain may be drawn down so as to wholly or partially cut off the grate, and, if desired, entirely cut off the draft therethrough.



Union Iron Works,

222 MARKET STREET.

SAN FRANCISCO, CAL.

This

Three-Stamp Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.

CONSOLIDATED

Kansas City Smelting and Refining Co.

Incorporated Under The Laws of New York.

Capital paid in..... .....$2,700,000.

Buyers of All Classes of

GOLD, SILVER, LEAD AND COPPER ORES,

Bullion, Mattes and Furnace Products,

GOLD BARS, SILVER BARS and MILL PRODUCTS.

SMELTING WORKS:
Argentine, Kas.; El Paso, Tex.; Leadville, Colo.

REDUCTION WORKS:
Argentine, Kas.

We use the following Cipher Codes at our Argentine Works: A. B. C. Code; Moreing & Neal's Code and Bedford McNeill's Code.

WORKS OF THE CON. KANSAS CITY SMELTING AND REFINING CO. AT LEADVILLE, COLO.

AGENCIES:

In United States—
Denver, Colo.
Cripple Creek, Colo.
Salt Lake City, Utah.
Spokane, Wash.
New York City, N. Y.
Chicago, Ill.
St. Louis, Mo.

In Mexico—
San Luis Potosi,
City of Mexico
Chihuahua.
Pachuca,
Hermosillo,
Jimenez.

FOR PRICES, ADDRESS:

J. E. Jackson, No. 6 Atlas Blk, Salt Lake, Utah.
C. D. Porter, Spokane, Wash.
H. A. True, 815 17th St., Denver, Colo.
J. H. Weddle, Leadville, Colo.
C. E. Finney, Argentine, Kan.

WEST COAST OF MEXICO.

WÖHLER, BARTNING & CO., Mazatlan (Sinaloa), Mex.

Bankers, Importers, Exporters and Commission Merchants.

Representatives and Agents of the principal Mining Companies in the State of Sinaloa and the dependencies of the Pacific coast in the States of Durango, Chihuahua, Sonora, Lower California and Jalisco.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

DEWEY STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Manufactured Only in California.

ANTI-CALORIC STEAM PIPE AND BOILER COVERING, IN CANVAS JACKETED SECTIONS, BLOCKS and PLASTER.

AWARDED CERTIFICATE OF SUPERIORITY AT MECHANICS' INSTITUTE FAIR, 1897.

Cal. Anti-Caloric Company,

507 MARKET STREET, S. F.
(U. S. Patents.)

RIVETED SHEET STEEL WATER PIPE
For Placers, Water Powers, Irrigation, Etc.
THE WEIGELE PIPE WORKS
2949-51 Larimer St. DENVER, COLO.

Coast Industrial Notes.

—The sale of the Union Pacific road will take place next Monday.

—The Santa Fe Railway Company paid out $42,000 at San Bernardino, Cal., for wages and salaries for the month of September. Last April the amount was less than $20,000.

—San Francisco hide and wool buyers are in Eureka and Lander counties, Nevada, contracting for 2000 horse hides at $1.50 each; tails and manes at 3 cents a pound; the bones at $18 a ton. The horses being killed are wild range animals.

—The annual report of Commissioner Hermann of the General Land Office shows that during the year railroad land patents were issued as follows in California: Central Pacific, 42,074 acres; Central Pacific (as successor to the California and Oregon), 13,504 acres; Southern Pacific, 122,348; Indian lands patented in California, 2861 acres. There now remain in California 35,217,527 acres of surveyed vacant lands, and 8,623,517 acres of unsurveyed vacant lands. During the year 1,298,355 acres of land were surveyed in California. The allotment for surveys was $20,000. For the ensuing year $15,000 is asked for surveys and $5000 for resurveys.

—The Corral Hollow Coal mine, Alameda county, Cal., is to have another $100,000 expended in improvements. Among other improvements is a plant for utilizing all the screenings. By hydraulic process, the screenings are united in a solid briquette and will burn readily. A tunnel 10x10 feet pierces the mountain a distance of nearly 3,000 feet. It crosses about fifteen coal veins that vary in width from inches to yards. At the terminus of the tunnel is encountered a solid wall of coal over 20 feet in width. This vein is 1500 feet under the surface of the ground; at this point the heat is stifling. The same wall of coal is found again 1000 feet below the 1500-level. Another improvement contemplated at the mine is the erection of an electric light and power plant.

—The California Supreme Court decides that the connecting lines of a railroad are agents of the company over which a shipment started. The Colfax Mountain Fruit Company entered into an agreement to ship a carload of fresh fruit from Colfax to New York City with the Southern Pacific Company. An agreement was entered into whereby the Southern Pacific agreed to forward the car by passenger train service to its destination, and did carry out that agreement so far as its own lines were concerned, taking it as far as Ogden, where it was turned over to the Union Pacific Company. The connecting line did not forward the car as agreed upon; it arrived in New York four days late, the contents greatly damaged. The fruit company brought suit and recovered damages. Upon appeal the Southern Pacific Company contended that it had carried out the terms of its agreement, but that it could not compel performance of passenger train service from its connecting lines; that it could only covenant to deliver on its own system. The Supreme Court affirms the judgment of the lower court, and holds that the connecting companies are agents of the Southern Pacific, and that the failure of any connecting line to carry out the provisions of the agreement makes the first line responsible for any damage.

—Consul Jarnigan writes from Utilla under date of August 3, 1897, in regard to a concession by the Honduras Government to citizens of the United States. A copy of the contract, transmitted by Vice-Consul Bernhard, of Tegucigalpa, under date of August 30, 1897, gives the names of the syndicate as follows: Chauncey M. Depew, W. Steward Webb, John Jacob Astor, Benjamin F. Tracy, J. G. McCullough, Frederic B. Jennings, George S. Scott, Nathaniel A. Prentiss, Charles McVeigh, and Melville E. Ingalls, jr. The agents for the syndicate were Henry L. Sprague and W. S. Valentine, of New York. The concessionaries are to construct and operate a railroad from Puerto Cortez, on the Atlantic, to the Bay of Fonseca, on the Pacific coast. The Government grants the syndicate the railroad, with all its appurtenances, now being operated from Puerto Cortez to La Pimienta, a distance of about 30 miles. The company is granted exclusive right of transit over land and water throughout the length of its route —the water rights being limited, however, to the construction of bridges, wharves, etc., necessary in the operation of the railroad. A subsidy of 100 English feet of land is granted on each side of the road, whether it passes through public or private lands. In the latter case, the Government is to pay the proper indemnity to the owners, and the company is to pay for the improvements of the land, in accordance with law. When the road passes inhabited sections, only half this width of land is granted. The Government concedes five square miles of land for every mile of railroad constructed. The land is to be located contiguous to the road, in alternate sections, when the road traverses public lands. When it traverses private property, the company has a right to select sections of land (under the above-named conditions) from he public property. This choice is to be made within five years from the date of contract. The grant is not to extend within one mile from the coast line, but the company is allowed the privilege of constructing stations, etc. Branch roads can be constructed under conditions similar to those given for the main road, and one shall extend to Tegucigalpa. The company can use all materials necessary for the road which are found in the Government lands, and no charge shall be made for the same. It also has the right to all minerals, etc., found in the lands conceded, provided that this does not interfere with previously acquired rights of third parties. The development of these minerals is to be subject to the mining laws of the country. The width of the line is not to be less than 1 yard 6 inches. Five miles shall be constructed within the first year. At the end of the second year, twenty-five miles are to be finished; at the end of the third year, fifty miles; at the end of the fourth, the road must have arrived at Comayagua; at the end of the sixth year, the line is to be completed and opened to the public. If the company fails to comply with these conditions, it shall pay to the Government 15 per cent of the gross receipts of the line until the conditions are fulfilled, an extention of time having been granted. At the expiration of this extension of time, if the said number of miles has not been completed, the road will pass into the hands of a trustee. The Government mail is to be carried free, and officials (not traveling in a private capacity) are to be subjected to no charge. The transportation tariff shall not exceed that on the portion of the line now in operation (except in the case of interoceanic traffic.) The cost of transportation of products of Central America is to be made low as possible. Passengers and freight engaged in interoceanic travel or transportation are not to be subjected to customs duties. Foreign colonists and workmen can be introduced (with the exception of negroes and Chinese), and the same will be exempt from personal taxes for ten years. The syndicate can issue bonds (not to exceed $20,000 in gold for each mile of road) and can transfer rights in the property to any one except foreign governments. After seventy-five years, the Government will have the right to purchase the road; the same option will be given at the end of each five years following; and at the end of ninety-nine years, the road and all its appurtenances will become the property of the State. The syndicate undertakes to liquidate the public debt of Honduras, and offices for this purpose will be opened in New York, London and Paris. Bonds are to be issued for one-fourth the amount of the original debt, to run for twenty-five years and bear interest at the rate of 1½ per cent (gold). These bonds are to be established, under the name of the Commercial Bank of Honduras, with a minimum capital of $500,000 (gold), divided into shares of $100 each. The bank has authority to act as the fiscal and financial agent of the Government and to be a depository of national funds. It can coin money, the net profits to be equally divided between the Government and the syndicate. The bank can grant mortgages (one-third of its capital to be devoted to this use) at a maximum annual interest of 15 per cent. It can make loans, guarantee Government bonds, and issue notes. There are to be five directors, with an additional one appoined yearly by the Government of Honduras. The bank was to take control of the customs of the country on October 1, 1897, and the Government promises not to change the tariff so as to reduce the revenue for fifteen years. (According to this agreement, says Consul Jarnigan, the increase in customs duties authorized by act of Congress last April will not take effect.) The bank is to pay 1,000,000 pesos (about $500,000) to the Government each year, and a certain per cent over this amount is to be applied annually to the payment of the new bonds. There is to be no tax on the railroad or on the bank capital. The syndicate is to equip one or more vessels to guard the coast and prevent smuggling. Consul Jarnigan speaks of the mineral and agricultural wealth of the lands conceded and of the advantages to Honduras which will result from their development. The United States, he says, will have practical control of the trade of the country.

Personal.

A. L. PEARSE, a London mining engineer, is examining a property near Gold Run, Cal.

H. BRATNOBER is in New York City en route to London to report regarding the Klondike.

JNO. W. MACKAY and party were in Grass Valley, Cal., this week, examining the Allison Ranch mine.

E. C. ENGLEHARDT is the new superintendent of the Kilton Reduction Co.'s works, Florence, Colo.

R. H. POSTLETHWAITE is in Oroville, Cal., arranging to construct a dredger to operate in the Feather river, similar to the one now operating in the Yuba below Smartsville.

GENERAL DUFFIELD, Chief of the Coast and Geodetic Survey, will be succeeded next Monday by Prof. Pritchett of Washington University, St. Louis, Mo., upon the recommendation of Secretary Gage.

PROF. J. M. SCHAEBERLE has been appointed acting director of Lick Observatory, in place of E. S. Holden. It is thought that either Prof. Schaeberle or Prof. Davidson will succeed Prof. Holden in the directorship.

MR. A. S. HALLIDIE has been deputized to visit various technical schools in the East preparatory to the selection of plans for the erection and practical working of the Wilmerding school in San Francisco.

HORACE F. BROWN is at Mercur, Utah, to superintend the erection of the Brown furnaces and the Loomis gas producers, which comprise the roasting plant of the new De Lamar Golden Gate mill. Mr. Brown can be addressed at Mercur until January 1st, '98.

MR. SAM'L J. HENDY, proprietor and general manager of the Joshua Hendy Machine Works of San Francisco, was unanimously selected by the California State Miners' Association at its convention last week as the treasurer of the Association for the ensuing year, succeeding Postmaster W. W. Montague.

R. U. GOODE, J. J. Gilbert and C. H. Fitch of the United States Geological Survey are in San Francisco. Mr. Goode is at the head of the Geological Survey on the Pacific coast, and has fifteen parties out doing geographical and geological work in various parts of the coast. During the past year Mr. Goode has traveled through Montana and Idaho and through the principal mining districts of this State. One of his parties is now making a claim map of the mother lode, to be completed January 1. Another party under Mr. Goode is running the boundary line between Montana and Idaho.

CHAS. G. YALE, special newspaper correspondent, has returned to San Francisco. He left July 28 on the steamer Excelsior en route to St. Michaels, Alaska, and thence went up the Yukon 1600 miles, getting within 400 miles of Dawson, when, the steamer being unable to go farther up by reason of low water, he returned home. He does not consider the reports of the value of the mines exaggerated, and thinks that there will be no starvation in that region this winter. He says: "In my opinion, the most extensive gold fields yet to be opened in the Yukon region will be on the American side of the boundary line. Whether any of them will prove quite as rich as the phenomenal Klondike district remains to be seen, but there is no reason why some of them should not."

Publications Received.

"*Geology and Veins of the Hauraki Goldfields, New Zealand.*" Jas. Park, F. G. S.; with colored maps and plates; an exhaustive and apparently authentic treatise on a subject of local importance; finely printed and illustrated. As in other countries "the source of the gold" is a subject of inquiry. The author concludes: "That the main lodes were primary channels or fissures, at one time filled with slowly circulating waters containing gold and silver, and probably base metals in solution. That the cross veins were secondary fissures filled with waters containing the metallic salts necessary for the electro-chemical deposition of the noble metals"; which seems sufficiently general to avoid other than abstract dissent. Accompanying the treatise in separate form are handsome colored maps and sectional views of the locality discussed.

"*Notes on Lead and Copper Smelting and Copper Converting.*" By H. W. Nixon, 8vo., 110 pp.; published by the Scientific Publishing Company, New York and London; price $3. Mr. Nixon was formerly superintendent of the blast furnace and converter department, Anaconda, Montana, and contributes valuable practical addition to the stock of knowledge in lead and copper smelting, and converting of copper matte. The author makes no attempt at elaborate discussion of the processes from the time the shaft is begun till the refined and manufactured product is in actual use, but from his own experience gives interesting details of how he smelted lead and copper and what he did it with. Illustration of how things should not be done is incidentally brought in, and up-to-date methods are technically described. Detailed shop drawings and cuts add to the value of the work.

Obituary.

ANDRE CHAVANNE, a pioneer capitalist, mining engineer and inventor, died in Grass Valley, Cal., last Wednesday, at the age of 79 years. He came here in the early fifties and followed mining until his death. He patented a nozzle regulator recently, which is illustrated and described on page 410 of this issue.

Commercial Paragraphs.

FRASER & CHALMERS have for the present discontinued their branch office at Salt Lake City, Utah, and request that all correspondence should in future be addressed to Messrs. Fraser & Chalmers, Chicago. Mr. J. W. Young will continue as heretofore General Western Manager.

Recent California Mining Incorporations.

Republic Mining Company, Los Angeles; Mrs. Downs, Mrs. Clark, Mrs. Eversole, Mrs. Brandis, A. M. Stephens; 40,000 shares.

Hard Cash M. & M. Co., Los Angeles; capital stock, $1,000,000; subscribed, $200,000; A. T. Stewart, Dr. B. O. Webb, I. N. Inskeep, J. E. Hunter, N. Wiltshire.

Assurance Placer Mining Company, Grass Valley; J. Mulroy, R. Connolly, J. J. Greany, R. P. Stevenson, E. E. Eitel; capital stock, $100,000; subscribed $50.

Oakland Con. G. M. Co.; W. S. Harlow, C. E. Snook, C. W. Greene, J. B. Barber, F. V. Wood, M. C. Chapman; capital stock, $125,000; subscribed, $875.

Recently Declared Mining Dividends.

Lillie G. M. Co., Cripple Creek, Colo., 1 cent per share, $8,100; payable Nov. 1.

Moon Anchor Co., Colo., 2½ cents per share, $15,000; payable Nov. 1.

Whitewater mine, Kaslo, B. C., $24,000; payable Nov. 1.

Directors of the Rio Tinto Company, Limited, have declared out of the estimated year's profit a half-year's dividend of 28s 6d per share on the 5 per cent preference shares, and an interim dividend of 20s per share on the ordinary shares, payable Nov. 1.

Geyser-Marion, Utah, $9000; payable Nov. 1.

MINE SUPERINTENDENT required who is thoroughly practical and experienced in Hydraulic, Drift and Quartz Mining and Milling. Apply, with references, to PACIFIC EXPLORATION CO., 29-30 Chronicle Building, San Francisco.

WANTED.

By a graduate mining engineer (age 29) any position in a mine, mill or office that may lead to advancement. Have my own surveying outfit. Address L.C., office Mining and Scientific Press.

WANTED — GOLD AND COPPER MINES.

We have customers wanting to purchase good developed Mines. Drawings and Report required. Will mail latter to fill out, when requested. Six to nine months' bond necessary, which need not stop work.
Will also put stamp mill on good mines, for half interest. Address RUSSELL & POOLEY, 449 Wilcox Building, Los Angeles, Cal.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does succe sful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capaci'y Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco

A HIGH GRADE
Gold and Copper Property,
FOR SALE AT A SACRIFICE.

HAVE GOT THE KLONDIKE FEVER. For Samples and Particulars, Address

APPARATUS

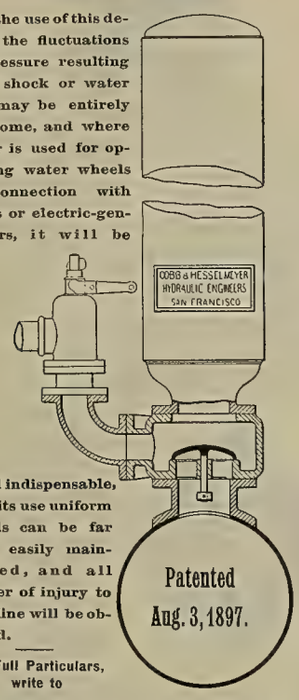
—FOR—

Regulating Pressures

—IN—

PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.



Patented Aug. 3, 1897.

For Full Particulars, write to

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

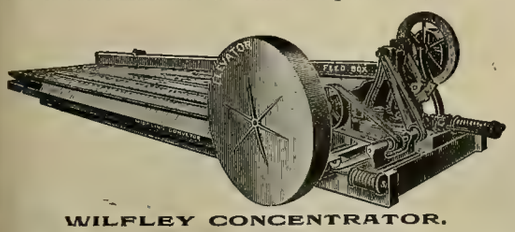
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

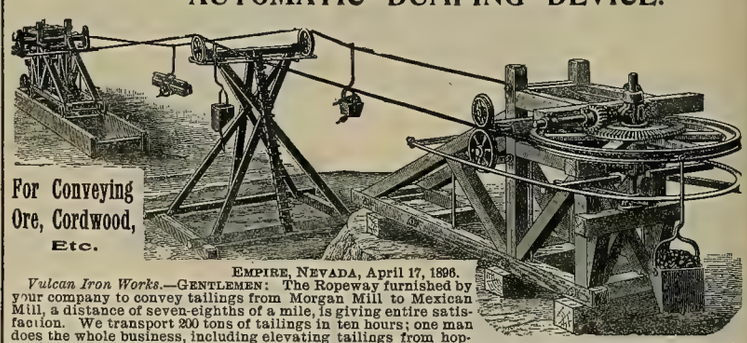
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 28, 1897.

There is a good demand for goods suitable for midwinter holiday purposes but for other lines business is rather quiet but not more so than rules at this season of the year. From all we can learn the retail trade in agricultural districts is more interested in collecting old accounts than in pushing goods. So far as we can learn the higher prices ruling for about everything raised make it possible for farmers to meet all store accounts. If this is done then the retail merchant will be able to commence 1898 on a better financial footing than ever before. With the wholesale trade the opinion prevails that after the turn of the year business will open out better than for several years and continue large throughout 1898. Manufacturers are also looking forward to more demand next year than has ruled even this year.

The banks continue to report heavy deposits, which shows general activity in all lines of trade. Remittances to the East continue free, which keeps exchanges on New York quite stiff. It is not at all unlikely that the premium on exchange will make further advances, for the shipments of California products will be soon falling off. The wholesale trade report collections easy, with more accounts squared than before known. Outside capital is still coming here for investment in gold mines, late as the season is, which encourages the belief that 1898 will be a banner year in this direction. New York advices state that loans are being made against sterling exchange. This indicates that shipments of gold to this country for the time being will not assume much proportion. It also indicates lower rates of interest in this country than abroad.

New York Silver Prices.

NEW YORK, Oct. 28.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	27⅛	58¼
Saturday	27	58⅛
Monday	27	58
Tuesday	27⅛	58⅛
Wednesday	27¼	58⅜
Thursday	27½	68⅜

	Copper.	Lead.	Iron.	Tin.
Fri.	11 00 @11 15	3 95	10 00@12 25	13 85
Sat.	10 90 @11 10	3 95	10 00@12 25	13 85
Mon.	10 90 @11 00	3 92½	10 00@12 25	13 80
Tue.	10 85 @11 00	3 92½	10 00@12 25	13 80
Wed.	10 85 @11 00	3 92½	10 00@12 25	13 80
Thur.	10 85 @11 00	3 92½	10 00@12 25	13 80

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.83½
London Merchants	$4.82
London Sight Bankers	$4.86
Refined Silver, per oz. 1000 fine	58¼
Mexican Dollars nominal	46¼

SILVER.—The market has held remarkably steady at full figures in the face of reports that the outlook for international action to ennoble the white metal is very unfavorable. It looks very much as if there is a scarcity and that to meet current wants buyers have to pay full. Evidently the quotations of the New York market as seen here are made too low, for our New York exchanges quote slightly higher than the price telegraphed.

MEXICAN DOLLARS.—The market is steady, with a good demand about the sailing of each steamer for China. The shipments have been quite heavy so far this fall.

COPPER.—Our market is weak, but not quotable lower, although it is stated that a shading can be had by prompt buyers. The markets at the East and abroad have set off owing to a lessened call from abroad and an indifferent demand in this country. The output of America is quite heavy.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt ¼ and 5-16, 20c; ⅜ and larger, 16½	

QUICKSILVER.—The market is quiet but steady.

Our market is quoted at $38 for domestic consumption and $34@34.50 for export to the west coast of Mexico.

LEAD.—The market is barely steady. The continued strength of silver is evidently against the market, for it makes consumers less anxious to anticipate wants for fear of an increased production of silver, which also means more lead.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 25	@	6 50
Pipe	5 50	@	6 00

TIN.—The market is dull, but not quoted lower. There is more inquiry for future delivery, but no sales, so far as we know, have been made. A New York exchange says: "The mills seem well booked for some months to come and are quite indifferent for orders, which is probably fortunate for the market, as at the present moment there is very small demand from can makers and packers. Prices remain unchanged. The feature of the situation is the small demand for charcoal ternes. The present month presents quite a contrast with October a year ago. At that time the buyers were booking tin plates heavily for next year's delivery. At the present moment there is hardly anything in the way of future contracts."

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing		@	15
Plate, I C coke, heavy, per box	$4 10	@	4 25
" " " light, "	4 00	@	—

SHOT.—The market is weak.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40		
Drop, B and larger sizes, " "	1 65		
Buck, Balls and Chilled, do, " "	1 65		

POWDER.—There is a fairly active demand, but chiefly for mining purposes.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

COAL.—The demand continues fairly free, notwithstanding warm weather. Receipts the past week aggregate about 29,000 tons of foreign and domestic.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00	@	—
Greta	6 00	@	6 50
Nanaimo	6 50	@	—
Gilman	5 50	@	—
Seattle	5 50	@	—
Coos Bay	—	@	4 75
Cannel	9 50	@	—
Egg, hard	12 00	@	—
Wallsend	6 75	@	—

TO ARRIVE—CARGO LOTS.

Australian	5 75		
Liverpool Steam	6 75		
Scotch Splint	7 50		
Cardiff	7 50		
Lehigh Lump	12 00		
Cumberland, bulk	10 50		
Egg, hard	9 50		
West Hartley	6 75		

COKE.—Considerable foreign has come to hand the past week.

The market is quoted as follows:

Gas Companies'	—		—
English, to load	—	@	—
" spot, in bulk	10 00	@	—
" in sacks	11 00	@	12 00
Cumberland	—	@	—

IRON.—The local consumption is quite heavy for the season. The outlook is favorable for a larger consumption this year than in any former year.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

NAILS.—The market is steady at full prices.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

NAILS.—The market is steady.

Wire, carloads, basis per keg			
" jobbing, " "	$2 45		
Cut, carloads, " "			
" jobbing, " "	2 35		

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

There can be no doubt that so far the market has been disappointing both here and at the East, for values have not responded to the increase in duties. This confirms previous statements that the trade had stocked up in anticipation of the increased duties, and until they get out values will not improve much, if any.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported easy from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is good for export.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA—The market is unsettled, with large buyers getting concessions owing to strong selling competition in primary markets.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Oct. 28, 1897.

The market ruled weak and heavy, but with no material shading off up to Monday, when there was a steadier tone, with slightly firmer prices for the middle and Gold Hill shares. The heavy and unpromising appearance of the market up to Monday afternoon caused many cash holders to sell and bring in large lines of margin shares. Where they went is not known, even to brokers, but it is safe to affirm they drifted into strong hands, who are informed on the work of a favorable character in the mines that will be made public at at an opportune time for a bulge in the market, so as to unload at a profit. On Tuesday the shares of Chollar and Potosi, which had been steadily absorbed for several days, as stated in this department, began to show more activity, resulting in quite an advance. Wednesday morning Potosi sold up to 83 cents and Chollar at 75 cents, but they soon went off under freer offerings, closing the day at from 20 to 25 per cent less. Hale & Norcross was more active, selling up to $1.45. In the Gold Hill shares there was more trading at a slight advance. The up in Chollar and Potosi is due to reports that in the Potosi workings there was an improvement with a decided increase in the output of ore. All of this, we stated some time ago, would result as it has, so it is nothing new. The bulls put out a report that they are liable to make a big development, so as to get the public to buy and take their holdings at higher prices. Outside of this the work in Chollar toward Potosi on the 500-foot level of the Brunswick lode is assuming importance. The character of the ground seems to improve, but the drift can be changed to run out of it. It is stated that when the south drift is run a fair distance into Potosi ground a joint crossdrift will be run to tap the ore found farther north. Kentuck levied an assessment this week. This ought to indicate that the company has decided to prospect their own ground to the west, and not wait for development work by Yellow Jacket and Crown Point. It looks to be a safe buy.

The interest of the trading public suddenly shifted from the Gold Hill mines to the middle mines owing to reports of an improvement in Potosi. Like a band of sheep being led to slaughter the trading public rushed to get in, whether they will get out at a profit remains to be seen, but unless strong moneyed men come to their rescue and bid the market up, it is a safe proposition the majority will not get out even. While there is active and important work being done in several mines, still, we think, there will not be anything developed for some time that is calculated to draw in big moneyed men, and without them a big upmove is an impossibility. From Utah our advices do not report any change. In Sierra Nevada they advanced the new tunnel 50 feet last week. On the Layton tunnel level they are extracting some ore on the 900-foot level. West crossdrift No. 4 was, at last advices, in vein matter, with water coming in. No change is reported in the Union workings. They are still drifting east in the 1000-foot level in Mexican. In Ophir they are still crossdrifting to the west on the 1000-foot level. On the old Central tunnel they are drifting south. Crossdrifting to the west has been stopped. In Con. Virginia they are doing active exploiting and other work on the 1550-foot, 1650-foot and 1750-foot levels. The work in this mine seems to be pushed with energy. No change is reported in the joint work of Best & Belcher and Gould & Curry. In the latter mine they are extracting low grade ore. In Savage the work is the same as reported last week.

In Hale & Norcross no work is being done. In Chollar they will be soon ready for exploiting. They are extracting fair-grade ore in Potosi and at the same time doing important exploiting work. From Con. Imperial, Alpha and Confidence the official letters are practically the same as last week's. In both Crown Point and Belcher active exploiting work is being done on the 800-foot level in the former and on the 750-foot and 850-foot levels in the latter. The work is for the purpose of developing the recent finds. In Yellow Jacket they are working on the 1000-foot, where it is said some ore has been found. From Seg. Belcher, Overman, Justice and Alta nothing new has come to hand.

The news from the Brunswick lode continues to confirm previous published advices of active work in Chollar and Occidental. In the latter mine they are exploiting the 500-foot and the 750-foot levels. The management seem to feel quite encouraged from reports received. In Chollar they are extracting ore from the 300-foot level. They are milling ore. On the 500-foot level they are drifting south, with the material changing for the better as it approaches the Potosi line. On the 600 foot level they are running several crossdrifts and also drifting south. In Savage they are opening up the 600-foot level. The Con. Virginia, Best & Belcher and Gould & Curry joint work is confined to the 300-foot and 600-foot levels.

The market opened inactive but fairly steady this morning after call. Chollar, Potosi and Savage sold down, but just before the noon closing Potosi, under a fair demand, began to move up, which brought in the short sellers as buyers, who rushed it up to 75 cents. This advance caused Chollar and Savage to do a little better. This afternoon the market was weak and slightly lower. After call it was still weak. Air connection has been made between the 750-foot level of Crown Point and the 850-foot level of Belcher. This will admit of active exploiting work being started within a day or two.

The following illustrates the changes of the week:

Mines.	Oct. 21.	Oct. 28.
Alpha	$ 11	
Alta Consolidated	15	$ 10
Andes	30	27
Belcher	68	50
Best & Belcher	52	48

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. F. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,

Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

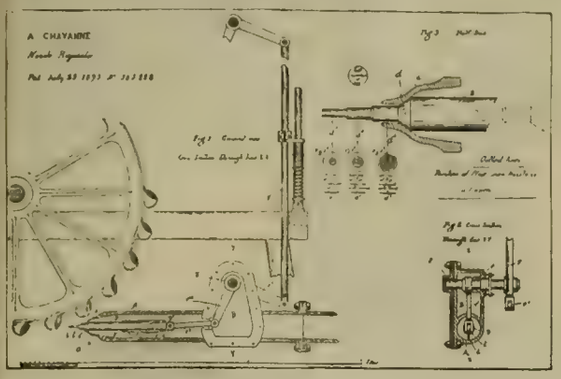
CONTRACTORS AND BUILDERS OF

HYDRAULIC AND QUARTZ MINING AND MILLING MACHINERY.

SOLE MANUFACTURERS

"CHAVANNE" NOZZLE REGULATORS
FOR TANGENTIAL IMPACT WATER-WHEELS.



"CHAVANNE" NOZZLE-REGULATOR.

The peculiar construction of these NOZZLE-REGULATORS effects a saving of thirty (30) or more per cent in the consumption of water without loss of power, and effectually precludes any shock or jar to the connecting pipe-line, as is attested by the following copy of a testimonial letter, selected from among many others of similar import:

MR. A. CHAVANNE, Grass Valley, Cal.

ORIGINAL EMPIRE MILL AND MINING COMPANY, Grass Valley, Nevada Co., Cal., February 29, 1896.

DEAR SIR:—We have used your nozzle and regulator for the past two months, and it gives us good satisfaction. We find that it has as much power as the old style Pelton nozzle, and we find the jar on our pipe in shutting off the water reduced from twenty-five to thirty pounds, and we save 30 per cent in amount of water used.

Yours respectfully,
[SIGNED] ROBERT WALKER, Superintendent.
EDWARD MOYLE, Engineer.

They can be applied to all forms of TANGENTIAL IMPACT WATER-WHEELS. Descriptive Circulars furnished and prices quoted upon application.

Assessment Notices.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 28th day of September, 1897, an assessment (No. 8) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 44 Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44 Phelan Building, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from J. F. Cowdery, in the Sackets Gulch Mine near St. Louis, Sierra Co., to deposit tailings in old pits; from the Santa Clara Mining Co., in the Richardson Ranche Mine near Shasta, Shasta Co., to deposit tailings in Clear Creek; from W. T. Sherman and O. F. Caya, in the Canada Mine near Fort Wine, Sierra Co., to deposit tailings in French Ravine; from R. Cordez, in the Mosquito Mine near Comptonville, Yuba Co., to deposit tailings in a ravine; and from C. N. Foote, in the Montalgo Mine near Uno, El Dorado Co., to deposit tailings in Cedar Creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 8, 1897, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from T. Larimore, in the Conrad & Wheeler mine, near Forbestown, Butte Co., to deposit tailings in a ravine, and from Edward C. Rigney, in the Round Butte mine, near San Andreas, Calaveras Co., to deposit tailings in Batista creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 15, 1897, at 1:30 P. M.

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

THIRD EDITION JUST OUT.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

DELINQUENT SALE NOTICE.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.— Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 3rd day of August, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Vein Structure in Nevada Co., Cal.

As elsewhere, in Nevada Co., Cal., the character of the fissure determines to a great extent the structure of the vein. The simplest form of a fissure is a joint plane, such as is seen in regions of intense sheeting about the Lecompton and Canada Hill mines or in the seam belt of the Red Hill, west of the Nevada City mine. On some of these joints there is a narrow line of quartz, accompanied by a slight bleaching of the rock on each side. Certain of these breaks along the joint planes may be more pronounced and extensive, or one larger break may be produced instead of a series of smaller ones. In such case there is usually a more noticeable movement along the fault plane, and the sliding of two irregular surfaces on each other produced more or less continuous open spaces, which were subsequently filled with quartz. This is the character of the Idaho-Maryland, the Mountaineer, and the Omaha veins, for instance; and on the 1400-foot level of the Maryland mine, well illustrated by Fig. 1 on this page, showing a 2½-foot vein of rich ore. The vein here consists simply of a filling of white quartz two to three feet wide between two parallel surfaces. The regularity is usually not maintained over a large extent of the vein. It is extremely common to find local pinches, and sometimes the vein is found to close down to a mere seam in whole levels, above and below which good ore is found. Again, in places the vein loses its regular character by reason of local fracturing and brecciating of the hanging wall. A typical occurrence of this kind is shown in Fig. 2, in a stope above the 1500-foot level of the same mine. To this first relatively simple type belong many veins in the district referred to.

FIG. 1.—VEIN ON THE 1400-FOOT LEVEL, MARYLAND MINE, NEVADA CO., CAL.

Two Recent Opinions.

The Commissioner of the General Land Office has just promulgated two opinions regarding assessment work on mining claims, and amount of work necessary to secure patent, that are of considerable importance to mining men in this country.

Referring to assessment work on claims that are contiguous and held in common, Commissioner Hermann holds:

"While the annual assessment work required for the maintenance of possession under Section 2324 United States Revised Statutes may be placed on one of a number of contiguous mining locations held in common and constituting one entire claim, yet the amount expended must equal $100 annually for each of the locations so held and worked in common."

The General Land Office has ruled that $500 in work or improvements was all that was necessary on a group of contiguous claims in common ownership to secure patent thereon, though the opinion has very generally been expressed that, before securing a patent, it must be shown to the satisfaction of the local office that work had been done amounting in the aggregate to $500 on each claim in the group.

On this point the Commissioner affirms a former ruling, where he says:

"The conclusion is apparent that an expenditure of $500 on one or more of several contiguous mining locations embraced in one application for patent is sufficient if made for the convenience of working or developing all of the claims included. This must conclusively appear, however."

This is a very liberal construction, and again authoritatively determines an important point, as the rulings of that official have all the force of law—at least, during the administration that appointed him.

It will be observed that cases exist where it is cheaper to get a U. S. patent than to do one year's assessment work on a group of mining claims, adjoining and owned in common. A man or company owning ten claims would have to spend $1000 annually under the above rulings, but can get a patent and forever dispense with the necessity of any further similar work upon payment of $500. Any one, however, proposing to take advantage of this should carefully note that it must be conclusively shown and made satisfactorily appear to the local official and the Commissioner that such expenditure of $500 upon one of such contiguous claims was for the purpose of developing and conveniently working all of the claims included in the application for patent.

It may be said in general that it is the constant policy and purpose of the Federal Government to make it as easy as possible for the miner to secure Government patent.

A Commendable Idea.

The fiftieth anniversary of the discovery of gold by Marshall at Coloma, El Dorado county, in this State, on January 24, 1848, is deemed by the San Francisco County Miners' Association worthy of celebration, with the general view of awakening a greater interest in the mining resources of this State, and consequently in the general prosperity of the commonwealth. The idea is worthy the active approval and support of everyone in the State.

The San Francisco County Miners' Association, under whose auspices the celebration is proposed, has contributed largely to the support of the California State Miners' Association, is composed of active participants in the mining industry, and is justly entitled to leading in the celebration of the fiftieth anniversary of the discovery of gold in this State on the 24th of January, 1898.

This is not intended to be merely a commemoration of the name and fame of the man who accidentally discovered the historic gold nugget in El Dorado county. Whatever credit is due any one man, or set of men, should justly be given those who developed the mining industry, who followed up this accidental discovery with intelligent study and brave effort, and who showed that California from one end to the other was a great mining region. The credit is due to the intelligent workers in all branches of hydraulic mining, and to the quartz miners, who made it possible, by improvement, to profitably treat ore that was once deemed worthless.

The world's output of gold for the year when it was discovered in California was but $30,000,000. In 1852 it had risen to $185,000,000. Through the years improvements innumerable have been instituted, largely of California origin. In hydraulic mining nearly all the appliances originated here. In quartz mining the revolving of the stamp head, the increasing weight of the stamp, the introduction of mechanical rock breakers, the invention of mechanical feeders, dynamite, mechanical rock drills, steam pumping, the wire rope, the chlorination process, the concentrator and, in later years, electricity and the cyanide process have revolutionized gold mining, have rendered workable large quantities of ores hitherto worthless, and have changed gold mining from a hazard to a legitimate industry.

What California has done for the mining industry of the world is a matter of record and needs no detail. All over the globe the mining industry is in a present state of activity, and now is a good time to direct attention to the fact that where the first flood of gold started fifty years ago there is still sufficient to keep California in the lead.

THE MINING AND SCIENTIFIC PRESS bespeaks the active support and cordial co-operation of the business men of this city and the entire State in the scheme of making the semi-centennial celebration on the 24th of next January a notable event. It is in order to have the Governor declare that day a legal holiday, to have a parade, the support and co-operation of the Society of California Pioneers, of the several California mining associations, of all the labor organizations, of the Native Sons, and that the event be celebrated in such a manner as to make it manifest that the same spirit that actuated men in the old days, when none but the daring came and none but the strong survived, still lives, and will hold this State in the front rank.

THE Mercur, Utah, mine is a good illustration of what has been achieved in the way of scientific progress in mining. Up to four years ago no way was found to satisfactorily treat the low grade ore. An article in these columns led to investigation, which resulted in the successful operation of a plant that has enabled the directors of the mine to last month pay a $25,000 dividend, No. 32, a total paid to stockholders of $825,000 from a property that three years ago was nothing but a hole in the ground because of lack of proper method to profitably extract the gold.

THE spirit of prophecy has again descended upon the Director of the United States Mint, and he outlines the probable gold yield of California for 1897. He seems to confound the amount of gold deposited at the San Francisco Mint with the gold yield of the State, and appears disposed to discount any authentic statement, his idea of the State's gold output being apparently made up in advance of the facts.

Proposed Change in Federal Mining Law.

At the October meeting of the California State Miners' Association Col. W. S. Keyes spoke as follows:

Mr. President and Gentlemen of the Convention, Fellow Miners of California: As a member of the Committee on Revision of the Federal Mining Statutes ordered by our last State Convention, and by appointment of President Neff, further, as a delegate to the International Gold Mining Congress, held at the city of Denver, July 7th of the present year, and further as a delegate to the Trans-Mississippi Congress, held at Salt Lake, July 14th of the present year, and by appointment of Ex-Governor Prince of New Mexico, President of the International Congress, as a member of the National Committee on Revision of the Federal Mining Statutes, which committee, pursuant to the call of the chairman, Mr. Moore of Cripple Creek, Colorado, met in Denver on the 22nd and 23rd of September last, I have the honor to report progress and submit for your approval, alteration, amendment or rejection, such changes in our mining laws as may to you individually and collectively seem best.

That our present Mining Code is in a sad condition of chaotic confusion will, I think, hardly be denied by any legitimate miner. It is equally true that more than thirty years after its first adoption, the courts have not yet been able definitively to construe it. Take, for example, the tunnel clause, with which you all are, doubtless, familiar. This has recently received a new judicial interpretation, viz: that the locator thereof has the absolute right to all veins, undiscovered at the time of its inception, to the extent of 1,500 feet on either side of the line of the tunnel. By earlier decisions the act was absolutely emasculated, by conceding to the tunnel owner a strip of about 6 feet on the line of the tunnel, defining the width thereof. That the law is a prolific source of acrimonious and costly litigation is a matter of common notoriety. On the authority of a former Surveyor General of Nevada, Mr. S H. Marlette, "there was expended in litigation, on the Comstock lode, during the years 1860-65 inclusive, not less than $9,000,000—one-fifth of the total product of the mines and considerably more than was declared in dividends during the same time." Senator Stewart estimates the cost of litigation carried on by the Chollar and Potosi Mining Companies, prior to 1866, at $1,300,000, and the expenses of the Ophir-Mosco w was at somewhat less than $800,000. The total costs of litigation in the Washoe district up to January 1st, 1866, he computes at $10,000,000. As a part of the litigation there sprang up a horde of greedy, conscienceless "standing witnesses" ready, for pay, to swear to anything.

In this connection I may recall a conversation in my presence between a celebrated mining magnate, since deceased, and a man supposed to be familiar with all the facts in a contemplated mining litigation. Said mining magnate wished to learn something about the original location, amount of work, etc., done upon a claim which he had bought or was about to buy, and to which there were several contending claimants. After diligent cross-examination, the man was proven to be utterly stupid or absolutely ignorant as to the facts. Our mining magnate lost patience and began to reproach the man in rather rough language. After awhile the man himself lost patience and blurted out: "Just tell me what you want to prove, and I'll know it fast enough."

As an example of the evils of litigation due to the looseness of our earlier mining law, I may here interject a statement of Mr. Eliot Lord, as it appears on page 134 of the Fourth Monograph of the U. S. Geological Survey. Speaking of the litigation on the Comstock, he says: "The cloud of uncertainty which rested on these titles grew blacker and heavier from month to month. Witnesses were manufactured by wholesale, and testimony to suit the requirements of the case was bought and sold with scarcely a pretense of secrecy."

On page 136, quoting from an address of Attorney-General R. M. Clarke, he says: "Chicanery won more suits than eloquence and learning. At that day (1863) the practice of the law had, to some extent, degenerated into the practice of villainy."

Such a depth of infamy had been reached that even the ermine on the bench was soiled.

I quote again from Mr. Lord, page 151: "The legitimate costs of this multitude of suits were enormous and the expenses of 'fighting fire with fire' were insupportable. The legal war culminated with the remarkable case of the Chollar vs. the Potosi M. Co. This suit was the immediate cause of the resignation of the whole territorial bench and resulted in a contention without parallel in the history of the litigation of mining claims in its duration, fierceness and cost."

I quote further from the speech of the Hon. Frank Tilford, delivered August 1, 1864: "A most potential cause of the present depression of mining is the deep and universal distrust of our judiciary. It is a fact, flagrant and notorious, that thousands and hundreds of thousands of dollars have been expended in obtaining corrupt decisions from infamous judges"

I quote further from Mr. Lord, on page 177. Speaking of the outcome of the Ophir-Burning Moscow litigation, he says: "To obtain possession of this section of the Comstock, 200 feet in length, nearly $1,000,000 had been spent, but it was finally purchased by the Ophir Company at a cost of about $70,000, while its market value, at the time, was only $50,000. No further commentary is needed to disclose the folly of the laws which allowed a locator to follow the dips, spurs and angles of his ledge anywhere."

On page 77 he says: "The total number of suits instituted and defended by twelve of the principal companies of the Comstock, prior to 1867, was 245." Their cost, as heretofore stated, was over $10,000,000. This vast sum was absolutely filched from the pockets of the owners of the mines, and would have sufficed for very respectable dividends in the interval. All of this waste is justly chargeable to the mischievous "law of the apex."

On page 308 Mr. Lord says: "The most preposterous titles would be trumped up, as fighting 'claims' so-called, and the discoverer of a bonanza might count himself fortunate if he recovered his original investment from the hungry mouths of contestants and lawyers."

"Jumping," perjury and crimes of violence were, in the early days, of constant occurrence. What else could have been expected when locations were often made by many ignorant and illiterate men, and even by men who designedly sought to take advantage of "finds" made by more industrious prospectors who had preceded them? Even if the claim was originally properly located, then came the question of record. The District Recorder was not always honest, and even if well intentioned he was often careless. And further, as I learn from what I have reason to believe to be competent testimony, the local land office in a certain very rich mining district was, some years ago, deliberately set on fire in order to destroy the records.

It is hardly to be expected that Senator Stewart, the stalwart and ever active advocate of our present mining statutes upon the floor of the Senate of the United States, should, years ago, have been the champion of the surface location to be applied to lode claims. But such, nevertheless, is the fact. I quote from the work of Mr. Lord, page 145: "Wm. M. Stewart proposed to end the Chollar-Potosi-Grass Valley litigation by *defining the respective claims by surface boundaries.*"

He was convinced that the principal wealth of the Comstock would be found to the east, and, although he did not disguise his opinions, he found few to agree with him. He formed a dashingly brilliant and sagacious plan to gain possession of most of the claims to the east of the line of workings at that time and then to fix the boundary line between the eastern and the western groups of claims.

To use the words of Mr. Lord: "When the boundary lines were determined, it was to be stipulated that planes should be drawn perpendicular to these lines, extending indefinitely downward, and that the mining operations of all companies should be confined within the limits of the planes bounding their respective claims. All pending suits should be adjusted as soon as possible, and, *the main cause of litigation having been removed*, he foresaw that the mining industry of the district would expand with natural vigor. Now, this was substantially a relinquishment of the *cherished but litigious principle* which allowed a locator to follow the dips of his ledge indefinitely and a substitution of the often decried Spanish or Mexican system of allotment; yet it was clearly the most expedient course to pursue." The scheme, sound as it was, fell through, owing to the obstinate stupidity of a majority of the Chollar trustees.

That Senator Stewart was not the only advocate of surface locations even on the Comstock is proven by the testimony of Judge B. C. Whitman, given on October 11, 1879, before the Government Land Commission, to which I shall later refer at length. Judge Whitman was then the attorney of the Great Bonanza firm. They submitted to him the question of the "apex" or surface location, and he replied as follows: (Page 421 of the Report.) "I think the square location, *i. e.*, common law, would have no injurious effect upon deep mining. On the contrary, it would improve it, have a good effect, always provided that the United States survey and fix the monuments. A man could go in there then feeling that he owned that piece of ground, and I think every prospector would be willing to avail himself of that and go to work on that supposition. The history, so far as I know, of every mine and mining company is continued litigation and expense by adverse locations. *With a square location there could be no litigation.* Mining men would be more

willing to invest in a square location than they would in what we call ledge locations."

The first Act of 1866 was so full of flaws that six year later—namely, 1872—it was amended by requiring a mineral ledge to be in the center of a parallelogram not more than 600 feet and not less than 50 feet in width, with a maximum length of 1500 feet. Within this space of ground no new claim could be located. This was a step in the right direction and shut off a vast number of pestilent jumpers. While it did away with certain evils it gave birth to others, in that it rigidly required the lode to pass through both end lines, in order that the locator might get or enjoy the full number of feet as claimed by him.

That the present law is not the flower of perfection I have the testimony of Dr Raymond, secretary of the American Institute of Mining Engineers and an authority on the "law of the apex." I quote from *The Mineral Industry*, Vol. III, published by the Scientific Publishing Company, New York and London, 1895, page 711, et seq.:

"Enough has been written, perhaps, concerning the curious, haphazard origin of our unique mining law and the innumerable disputes which its eccentric, vague, inconsistent and ill-considered provisions entail upon mine owners—though, perhaps, all these things will need to be reiterated again and again before they will be realized by all the parties whose co-operation is necessary to a radical reform.

"Enough has been written concerning the object lesson presented at this time by the mining districts of the world, *including the greater part of the mining industry of this country*, in which mining litigation is unknown, while in certain of our States and Territories such litigation burdens the courts, oppresses the owners and operators of mines and enriches only lawyers and experts. This lesson also may need to be enforced hereafter by repeated exposition; but only because of the slowness of the pupils who should have learned it long ago." * * *

"My first report as U. S. Mining Commissioner of Mining Statistics, written in 1868, contains an argument in favor of the then existing law.

"In the same volume will be found a paper by Mr. W. S. Keyes, then residing in Helena, Montana, condemning the U. S. law and frankly urging the adoption of the principle of vertical boundaries or mining titles."

On page 712, Dr. Raymond writes: "The prospector is best rewarded by a grant of something definite which he can safely hold or easily sell, rather than of something so vague as to be forever uncertain."

On page 713, he says: "The actual expense of litigations under this law has mounted into the millions. Is anybody silly enough to suppose that mines subject to such an extra risk can be sold as easily or at as high a price as if the purchaser was sure of getting what he thought he was getting, and sure of being protected in the rights thus definitely acquired?" * * *

Again he says: "*The full development of the mineral resources of the West will never come to pass* until the capital it requires is better protected by definiteness in title and boundaries of mining property. And that can not be done, in my judgment, by any amendment of the present law which shall leave in it the present abnormal, irregular, indefinable, precarious and mischievous extra-lateral right.

"How many years longer will our Western fellow-citizens interested in mining continue to look upon the enormous investments of capital and the amazing resultant development of wealth through mining enterprises, which characterize every mining State in the country where mining rights are bounded by surface lines and vertical planes only and 'the law of the apex' is not known?

"Let them take note of the immunity from vexatious and ruinous conflicts over boundaries of mining rights enjoyed by placer mines and coal mines under their own eyes and draw the obvious inference that a similar immunity conferred upon lode mines would be a boon to all concerned."

Without pretending to be "either a prophet or the son of a prophet," I may be permitted to recall a few of the lines written by me twenty-nine years ago, to which Dr. Raymond refers, as follows:

"In my humble opinion, the 'local rules and customs' are too uncertain for security and are entirely inadequate to prevent that litigation which is and has been the curse of our mining system. I totally dissent from that portion of the local law which gives the mine owner the right to follow all the dips, spurs, angles and variations of his lode, even though it may enter the land adjoining. I object to the law as it now is, for the reason that it is the frightful source of litigation and violence.

"No law should be tolerated which does not give a reasonable freedom from assault. The system at present in vogue has fostered and will foster the most vexatious litigation. * * * *

"It is this uncertainty of title, fear of litigation and blackmail, which do more to retard legitimate mining than all other causes combined. Hence I can see no usefulness in any law which does not render unassailable, or, at least, reasonably so, a title once obtained from the highest authority. To this end I can conceive of no enactment unless one which gives a surface beneath which, even to the center of the earth, every precious or useful metal or mineral shall be the property of the patentee."

I am in receipt of a letter of recent date from Dr. Raymond, in which he assures me of his hearty concurrence in the views expressed by me nearly thirty years ago. That is to say, he is radically converted.

In view of Dr. Raymond's reference to the immunity from litigation in States where the "law of the apex" does not obtain, I may refer to the testimony of Mr. W. H. Stevens of Michigan and Colorado. I quote from page 307 of the Report of the Public Lands Commission of 1880. Mr. Stevens said, in relation to the status of the mining laws in the States lying to the west and northwest of the Great Lakes:

"In Michigan *only one case has been carried to the Supreme Court* in the last twenty-five years where the question of title to mining lands was raised. This was a contest between the Minnesota and National Mining Companies. The National Company held their title from a grant made by the State of Michigan under the provisions of the School Act. The Minnesota Company derived their title under the old land law permitting location and pre-emption by authority of the War Department."

Hence, the question at issue turned merely upon the decision of a conflict precipitated by two grants made respectively by the U. S. Government and by the State of Michigan. Such or a similar question might have, and in fact has, arisen as between claimants to agricultural lands. Our present mining statutes are a veritable Pandora's box of evils, a prolific source "of woes unutterable" to the legitimate mine worker. The crying defect is the "law of the apex"—the "extra lateral right." At the present time there are only three countries in the world which still maintain this absurd provision, which has been the cause of greater and more acrimonious litigation than all others combined. These countries are the United States of America, Bolivia and Mashonaland in Africa—civilized, semi-civilized and barbarous.

There is no need to particularize as to the effect of this "right" as far as litigation in the first-named country is concerned, and as to the last I am not sufficiently informed. As to the second, however, I quote the testimony of Arthur F. Wendt, M. E., published in the "Trans. of the Am. Inst. of Min. Eng.," Sept., 1890, page 4. Speaking of certain mines near Potosi, he says: "It is on record that in 1660 one Brigadier Montes, owner of the Guaillahuasi mine, lost a suit brought by Esteves, owner of the Flamencos mine. Montes had crosscut from the Guaillahuasi to the Flamencos vein, below the workings of Esteves, and claimed to be working another vein. The report says that six hundred men were at that time at work extracting 150-ounce ore for Montes. When the suit was decided against Montes he is said to have destroyed the mine. Be that as it may, neither the Flamencos nor the Guaillahuasi mine have been worked for over a century, although both are claimed to be among the richest on the mountain. It appears from this lawsuit that considerable depth had been attained by the mines of that period, and that the ridiculous law of following a vein, which then held good in all Spanish-America—and still obtains in the United States—was even then resulting in interminable legal controversies."

Our own MINING AND SCIENTIFIC PRESS of this city, in a leading editorial under date of August 21st, 1897, comes out distinctly for surface boundaries for lode claims. In another editorial, under date of October 2nd, 1897, the same expression of opinion is repeated.

I had feared that, in view of possible loss of future valuable clients, the members of the legal profession would oppose the views heretofore set forth, but, to their credit be it said, I have found a substantial unanimity of opinion as to the necessity of reforming our mining code, and I have not yet heard a dissenting opinion from a single member of the profession as to the advisability of doing away with the extra-lateral right. Indeed, I may quote from a letter of one of the most distinguished members of the Colorado bar, sent to the Chairman of the National Revision Committee at Denver.

In reply to the question as to how far he would go in revising the present Federal mining law, he writes:

"September 14th, 1897.

"It is impossible for me and, I think, for anyone else, in the short space of an ordinary written communication, to outline what seems to me to be the extent to which that revision should go. Indeed, my own judgment is that the present system of Federal mining law is not worth revising. It ought to be repealed *in toto* and a mining code enacted upon entirely different principles and ideas from those which lie at the foundation of the present system. There is no more absurd, complex, irrational and illogical conglomeration of so-called statutes to be found anywhere than our Federal mining law and the State laws necessarily based upon them.

"The methods provided for location and patent, to say nothing of the interminable confusion consequent upon the recognition and attempted enforcement of extra lateral rights, have involved mines and miners in a mass of litigation the extent and expense of which are almost incredible.

"These things will continue so long as the system continues.

"It should be wholly eradicated, and all attempts at revision, in my judgment, while they may mitigate, cannot remove the evils which are so apparent to men like you and myself.

"Yours very truly."

Under the Act of March 3rd, 1879, there was created a Public Land Commission to rearrange, alter, amend or propose new regulations touching the public lands. The printed conclusions of this Commission, together with the testimony on which they based their action, was issued from the Government Printing Office in 1880.

This Act reads (in part) as follows: "Provided that the Commission shall consist of the Commissioner of the General Land Office, the Director of the Geological Survey and three civilians to be appointed by the President." * * *

They were to report to Congress within one year: "First, a codification of the present laws relating to the survey and disposition of the public domain; second, a system and standard of classification of public lands as, arable, irrigable, timber, pasturage, swamp, coal, mineral lands and such other classes as may be deemed proper;" etc., etc.

The Commission was appointed, consisting, besides the ex-officio members named in the Act, of Mr. Thomas Donaldson of Philadelphia, Pa., Mr. A. T. Britton of Washington and Mr. John W. Powell of Illinois. They took testimony from every mining State and Territory, and finally drew up a Mining Code which, in my judgment, at least, will, with few amendments, give to the people of these United States a set of statutes which will insure to the benefit of labor and capital alike; will ring the death knell to jumpers, "claim hogs," perjurers, speculators and such as wish to get something for nothing; will stop our ruinous litigation and make an United States patent a perfect monument of title and, in the words of Justice Field of the U. S. Supreme Court, "ironclad against all (speculative) objections."

In order not to extend this paper to an undue length, I beg to read from the Report of the Commission a part of their conclusions. I may premise by saying that there are in all 790 pages of printed matter, much of it in small type. The replies came from practical men, miners, mine owners, Surveyors-General, Registers and Receivers of the Land Offices, deputies and a host of others. There were but three or four among the hundreds who gave testimony upon the matters now in question who were content with the present mining laws.

The Report condenses and sums up the testimony so much better than I could do that I venture to ask a few moments' time in order to read a portion of it. I quote from the Report, page 35:

"While in a large class of cases the law conveys definite rights and protects the grantees, in a far larger class it simply bequeaths a piece of paper and a legal contest.

"We find an extraordinary and characteristic difference between the mineral development east of the Missouri and that west. The first is almost absolutely free from litigation growing out of conditions of the Government conveyance. The other is the history of the most frequent, vexatious, costly and damaging litigation.

"There are two general features in the existing statutes which have provoked and directed the main lines of legal contest, and they are: First, the recognition by the law of the local customs and regulations. Second, the attempted conveyance of a lode, ledge or deposit of rock in place bearing mineral, as a thing separate from and independent of the surface tract of ground, with the permission to follow the lode on its dip, even when in the downward course it passes beyond the side lines of the surface claim.

"The law leaves all the conditions as to location, notice, record of location and area of claim within certain wide limits to local regulations. That is to say, the Government proposes to convey a portion of its public land, and bases the very origin and initiation of that conveyance on the acts of an official wholly outside its jurisdiction.

"Title after title hangs on a local record, which may be defective, mutilated, stolen for blackmail, or destroyed to accomplish fraud, and of which the grantor—the Government—has neither knowledge nor control. In the testimony taken by your Commission it was repeatedly shown that two or three prospectors, camped in the wilderness, have organized a mining district, prescribed regulations, involving size of claims, mode of location, and nature of record, elected one of their number recorder, and that officer, on the back of an envelope or on the ace of spades, grudgingly spared from his pack, can make, with the stump of a lead pencil, an entry that the Government recognizes as the inception of a title which may convey millions of dollars.

"From such extreme cases, frequent as they have been, there is a wide range of organization to the duly elected county recorder, but even that official, who represents the most favorable working of the system, is not responsible to the United States. He is neither bonded nor under oath. He may falsify or destroy his record; he may vitiate the title to millions of dollars' worth of claims, and snap his fingers in the face of the Government. All the local officers are made indirectly the agents of the Government at the critical stage of a vast class of transactions without an iota of responsibility or a syllable of instruction from the principal.

"It is true that the statute of 1872 does not make a record obligatory nor does it define its effect. Miners at their meetings might draw the provisions of their code without mention or requirement of record, but practically they exercise the privilege which the statute does not inhibit, and create a record. Having, as is universally the case, made the record a part of their code, the Federal law, having recognized and enforced the code, is thereafter bound as to its conveyances by the record, with all its preposterous seeds of harm.

"The continuance of this early practice, which has survived not only its original necessity and usefulness, but every semblance of value, is perhaps due more than all other causes to the excited, sudden and transient character of the industry. The immediate returns, the movements of the stock board to-day, the swift conversion of bonanza into bullion, are the points which absorb men. Permanent ownership and security of tenure are less considered. Like a great wheel of fortune, the dazzling prizes blind men to the sober legal conditions on which security depends, and, as a result, no branch of American enterprise has ever paid to litigation so great and so unnecessary a share of its gross returns."

"Judge Beatty, our present Chief Justice, writes conclusively that the local records are of no practical value, and hence there is absolutely nothing whatever to weigh against the crying evils which their continuance entails. On page 398 of the book of testimony he says: 'The magnitude of the evil resulting from the uncertainty of mining titles will, perhaps, be appreciated when I say that after a residence of seventeen years in the State of Nevada, with the best opportunities of observing, I cannot at this moment recall a single instance in which the owners of really valuable mining ground have escaped expensive litigation, except by paying a heavy blackmail.'

"Your Commission find that a large majority of the mining men consulted during the examination of the Western States and Territories clearly shared our conviction: First, that the local regulations are of no use; secondly, that they are a great positive harm; thirdly, that by Congressional enactment they should be promptly abolished as to all future locations.

"Accordingly, in the code of legislation submitted herewith, it is directly provided that "all future occupation, location or purchase of public mineral lands shall be governed by laws of Congress, to the exclusion of all local customs and regulations and State and Territorial law" (Section 172); and a mode of location is prescribed which requires all the acts necessary to pass title for public mineral lands from Government to the purchaser, to be performed by the locator, his assignor agent, and the duly bonded and qualified officers of the United States.

"With a defined fissure vein, by spending many thousand dollars, and, providing his cloud of expert witnesses are not tripped up by clever cross-examination and the judge is impartial and the jury are not corruptly influenced against him, after many months, and perhaps years, during which his enterprise has been handcuffed with injunctions and himself reduced to poverty, the owner might derive whatever hollow comfort he could from a victory which left him ruined.

"The law brings honest neighbors to the point where they discover that the Government has seriously sold them both the exclusive right to the same thing and the courts have forced one honest man to rob the other.

"The line of adverse proceedings is this: One man locates an honest claim on the evident apex of a true lode. Fifty or a hundred tramps locate claims all around him and over him, burying his tract deep with thickly stratified possessory titles. Not one of the tramps has discovered a lode; he has simply marked out a piece of ground and paid the recorder's fee, bestowing some name upon his imaginary discovery. The tramp's claim is obviously valueless for working, but he is in a position, for a fee of $5, to mine without the cost of muscle or plant. And where? Not on his alleged lode, but in the already coined earnings of his neighbor, the honest discoverer.

"The blackmailer's method is simple and effective. Located over the dip of the honest discoverer he has only to say to him: 'It will cost you less to pay than fight.'

"The robber's method is somewhat bolder and less certain of success, but his prize is greater. He sinks through his worthless claim and cuts the honest locator's veins where, in the language of the law, they 'so far depart from a perpendicular in their course downward as to extend outside the vertical sidelines of the honest claims.' The honest miners are then in the hands of justice, which means injunctions, trials, expert testimony, juries, and an abominable waste of money.

"Your Commission, after a review of the lines of mining contests and a consideration of the complex nature of ore deposits, are unanimous in the conviction that any attempt on the part of the United States to convey such deposits as individual things beyond the vertical planes bounding the surface claim, must always end in a history of intolerable injustice.

"The result of our test of public opinion shows that, while there are regions whose simple fissure veins have not caused battles, and where, consequently, the people ask no change, the majority of experienced mining men desire a change from the lode location, with its disastrous sequel, back to the security and peace of the solid old common-law doctrine.

"The existing law holds out the conditions for obtaining patents. Having permitted an inception of title dangerously vitiated by acts of local agents outside of the Federal jurisdiction; having permitted a lode location with its indefinite conditions; having permitted the robbers and blackmailers to acquire a cheap and secure fighting title, the Government then causes its unfortunate victim to set himself up as a target for attack by advertisement for patent, and when attacked calmly turns its back and permits him to be dragged into the local courts.

"In short, the present law might be fitly entitled 'An Act to cause the Government to join, upon unknown terms, with an unknown second party, to convey to a third party an illusory title to an indefinite thing, and encourage the subsequent robbery thereof.'

"The Commission has thought that the time has arrived when Congress should formulate the legislation to govern the changed conditions of an occupation which has passed from a frontier experiment into a national industry.

"If mining is to be continued as an experiment, or for speculative purposes alone, an adherence to the existing customs is desirable. If it is to be continued as a business, upon settled principles and with expectation of legitimate returns, it should be governed by the same rules which the wisdom of centuries has formulated for the definition of all real property titles.

"The insecurity and hazard of the first system could be well followed by a continued relinquishment of Federal control over its own property, both in the inception of title and in the adjustment of controversies.

"The certainty and security of the second system should be maintained by an assertion of the national jurisdiction over its own property in all stages of progress, until the title is vested in private ownership.

"In the new law submitted for the consideration of your honorable body we have attempted to preserve all the valuable and practicable provisions of the present statute, and sought to cure all its flagrant wrongs.

"We have protected the prospector for an ample time to test his discovery, but we have fixed a limit to his possessory title; and thereafter, failure to tender purchase money shall work a forfeiture of the claim.

"We have in terms abolished all the local organizations and regulations, reserving to the United States full jurisdiction over all questions, from location to patent.

"We have repealed the lode location, and substituted the common-law rule in its stead.

"We have, by a system of official survey and mineral inspection, prevented blackmail and robbery, and obviated those contests which necessitate the intervention of the courts before patent."

It would occupy too much time to go over in detail the testimony of all the witnesses who gave their views to the Commission. Suffice it to say that a careful inspection of this rather voluminous document thoroughly substantiates the conclusions heretofore set forth.

The Mining Code should be simple, so that any man of ordinary intelligence can understand it and comply with its provisions. In the words of Mr. Lord, on page 180, Fourth Monograph: "Clear, just and simple laws may be childish in the sense that even children can comprehend them, but it by no means follows that children would be able to frame them; yet it would be nearly as sensible to allow children to legislate for their own government as to permit uneducated miners of limited experience to parcel out the mineral lands of the country and then to compound their district regulations into a code of universal application."

As a member of the Board of Trustees of the State Mining Bureau, I, more than a year ago, directed the secretary to solicit, in behalf of the Bureau, copies of all the mining codes of all the States of our Union and of every mining country in the world. The responses were prompt and much matter of value was sent to him, which I have been studying for the last twelve months or more.

All countries except the three heretofore referred to preserve the "common-law right" as to lode locations.

They vary in size from the claim or "pertenencia" of Mexico, which is 100 meters square, equaling about 329 feet by 329 feet, and containing 2.47 acres, up to the amount allowed under the laws of British Columbia, which is as a maximum 1500 by 1500 feet. In all, the codes take precedence of and in fact forbid any State or local rules and regulations. And, best of all, we hear of no litigation as to boundaries and no acrimonious contests. All questions of underground trespass are easily settled by calling in a competent surveyor.

In conclusion, I have the honor to propose the following as the sense of the members of this convention:

First—*Resolved*, That the existing Statutes of the United States touching mineral lands require radical amendment.

Second—*Resolved*, That the "law of the apex" and its corollary, the so-called "extra-lateral right," should be abolished and a return made to the common law right of surface boundaries, and that the claim or unit of location be of sufficient width, i. e., of sufficient width on the side of the dip, to permit of excavations on the ledge to a depth of 1800 or 2000 feet, when the angle of the dip is not less than 45°.

Third—*Resolved*, That the local "rules and regulations" ought to be abolished.

Fourth—*Resolved*, That the Congress of the United States be petitioned or requested to formulate a complete mining code, touching all matters from the inception of the claim (location) to the final acquisition (patent) thereof.

Fifth—*Resolved*. That the process of applying for and obtaining patent should be simplified and made less costly to the miner.

Sixth—*Resolved*, That Section 2333 of the Revised Statutes, relating to so-called tunnel locations, be restricted in its application to the deep placers of "dead rivers," whose course and direction are not shown upon the surface by reason of accumulation of drift, soil, lava or other rock. A tunnel for the discovery of such deposit or deposits must be prosecuted with due diligence, and proof of such diligence shall be held to mean work upon the tunnel for not less than four months in each year, with at least two shifts of workmen. The channel, "deep placer" or "dead river," when encountered, to be locatable to the extent of not more than 1500 feet up and 1500 feet down stream from the point of intersection by the tunnel.

Seventh—*Resolved*, That all the precious or useful metals, earths, rocks, stones, fossils, mineral oils, bitumens, natural gas, hydrocarbons, natural fertilizers—in a word, any substance found within or beneath the surface of the earth and having a commercial value, should be subject to location under the section or sections of the law applicable to placers.

Eighth—*Resolved*, That any party or parties who may desire to avail him or themselves of the provisions of the present laws must apply for patent before January 1st, 1900. A failure so to apply shall constitute a forfeiture of all such claim or claims, and thereafter the land shall be open to location as other public mineral lands.

Provision should be made so that mineral land so abandoned may be located preferentially by a neighboring claim, whether possessing a secure location or not, if such land may be claimed (located) within a reasonable time, say within six months, and no other location shall be allowed during said period unless such neighboring claim owner shall, in writing, have declined to take up such abandoned ground.

Ninth—*Resolved*, That a committee consisting of members of this convention be appointed by the President to formulate in detail the provisions of a bill in accord with these resolutions, to be placed in the hands of our Senators and Representatives in Congress, with a request to urge its passage in the next Congress.

Geology and Man.

Written for the MINING AND SCIENTIFIC PRESS by WALTER C. CHAMBERLAIN, Geologist.

Into whatever depth of knowledge or science mankind has gone since the beginning of his semi-barbaric state, when he emerged from the darkness of the Pliocene or early Quaternary age, his learning cannot be accepted as definite, theory and investigation must be therefore substituted, while Nature guards her secrets with a sleepless eye.

The world revolved on its axes just the same minus man apparently for many millions of years, and various other classes of animals were antecedent to him, so to speak. He is, according to the views of many learned men, a recent product. Compared with the length of geologic time, his advent, therefore, according to biblical ideas, was detained until the times and conditions of this earth were best fitted for his existence.

Geology in its wide expanse gives us, first, an age or a division of time when there was no life on the globe; or, if any did exist, it must have been of the simplest kind, plainly showing us that man has taken his time in attaining his present position. From archæan time up to the Pliocene age a slight trace and only faint and indefinite evidences of his existence are found; or, if he existed at all previous to the above age, his existence in prehistoric time must have been a very primitive one, as about every other class of animal matter of importance—both terrestrial and marine—that has occurred up to the present has given paleontology some slight record to show it once held a place in the secret workings of nature, while that of man is very vague.

His present distribution is just as perplexing. Consider his isolated position in some of the South Sea islands, thousands of miles from mainland, supposing that in some cases volcanic upheavals were responsible for his islands. Whence comes he? The theory that he may have drifted there in boats is not impossible, but not altogether probable, considering the primitive means of transportation.

The equal distribution of these people on nearly every bit of habitable land in midocean means that at or about the beginning of one of the past geological epochs, subsidences and upheavals were of frequent occurrence in that portion of the globe where the crust was thin and the pressure intense. Take, for instance, the Hawaiian group: The alluvium is thick and plentiful, and sedimentary matter equally so; there is evidence of a basaltic rhyoletic flow in places, but the energy of later ages has been confined to the larger islands. There are extinct craters on several of the smaller islands, but what is left is evidence of a meager kind, only illustrating that, if they had in past ages been the seat of any powerful volcanic activity, dissolution of volcanic matter produced sedimentary depositions sufficient to show that the island, by its deep accumulation, to be of a ripe age.

If there was any history left by the primeval members of these islands as to how they occurred, it has become obsolete in the vast eon of time which has elapsed since they took up their abode on these seagirt isles, although I understand there is a tradition among the remnants of the Hawaiian race that they landed there by the means of boats or rafts, etc. We must, therefore, accept it as authentic, as we cannot proclaim for ourselves any direct definition or try to make manifest something we cannot look into otherwise than through the eye of man, which is limited and not an authority.

The archæan condition of the world after having gone through the igneous process leading up to its formation, and up to the time of the occurrence of the first form of organic life, was such as to show mankind that the decay of the elements which formed the globe, after its fires had ceased, was the hotbed from which, by the aid of an atmosphere and solar heat, organic agencies would arise and life in its various forms would assert itself.

Evolution or divine creation may have been the author of the human being, but, notwithstanding these possibilities, man stands alone in his supreme mystery. Is it possible that this wonderfully endowed being, Man, found his first organism in the primordial Lingula, when there was supposed to have been no evidence of terrestrial life whatever? The awe-inspiring depth of the subject leads us to look at it from another standpoint, and, shifting the hypothesis to another point of our imagination, we must look to the eccentricity of our planet in its orbit and the many different transitions which have occurred previous to its reaching the present habitable state.

This planet has not always been subject to the same control and conditions as it is at present. Tribes of animal life have been ushered in to encounter some unusual condition, whereby they have become extinct in a single geological age, embracing a few million years, showing that the earth suffered from changes in its physical conditions, which were quick destroyers and generators. Animal life in the zenith of its power, compared with the working forces of nature and the universe, is weak indeed. Its equilibrium rests on such a precarious foundation that any slight increase in temperature by either the agencies of heat or cold would be "like taking a stone from an arch—destruction to the whole." Whilst animal life has increased and decreased in its various forms throughout the many long geological ages, planetary life is obeying the forces which are still in operation. It would require only a slight disturbance by the sun or some unknown agent to cause complete annihilation of every class of animal matter, with a reaction that would leave our mother earth an inanimate mass, like the moon, with no witness to vouch for its former state. Many such disturbances have occurred since the earth assumed its spherical form. If we admit the plutonic formation of this globe, the earth, therefore, is much smaller now than when it first concentrated all its matter into a revolving mass. It must have been three times its present diameter, more or less. It stands to-day a sedimentary globe, having lost by volatilization two-thirds of its primitive bulk.

In primordial times it suffered submergences, owing to the presence of a dense atmosphere which occurred at intervals with its other phenomena.

Intellectual animal life no doubt existed in prearchæan times with other matter when conditions were favorable, although many geologists and scientists adhere to the hypothesis that man appeared not earlier than the lower Pliocene or Quaternary age. This is accepted simply because there is not much evidence of him previous to the stone age, and, being a subaerial animal of frail construction physically, and leaving no fossil evidence to speak of, it leaves their opinions one of pure conjecture and open to any supposition. A strong body of scientific evidence, judging from other classes of animal matter, goes to prove that man is an old inhabitant, having been subject to conditions which have exterminated him and regenerated him in accordance with the mysterious laws of Nature, like other animal matter which could be brought into action by comparatively slight changes in the physical conditions of the earth. Of the many different epochs and periods, embracing millions of years since the earth took upon itself its mantle of life, this era is possibly one of the many which have been fortunate enough to have reached such a high state, all owing to its quiet and undisturbed position, coupled with favorable astronomical conditions.

Any igneous disturbance which might affect the temperature of our atmosphere a few hundred degrees, or the entire surface of the earth to a meager depth, would furnish results which would destroy any trace of previous existence of mankind and convert its surface into a dross, leaving our globe a virgin world to reanimate itself and begin life anew, as it is supposed to have done in the lower Silurian age. Such is cosmology.

This poor old whirling mass of matter has not always been a chronometer of regularity, and its contorted strata give great proof of how it suffered to make a home for its present brood of human kind.

Edison's Ore-Working Process.

The success is again announced of T. A. Edison's process for the electrical recovery of the iron contained in low-grade ore. The inventor's experiments have been carried on during the past six years. His process in brief consists in pulverizing the ore. The corder is then allowed to fall in close proximity to electric magnets which deflect the iron to one side and the non-metallic matter falls to the other side by gravity. Edison's magnetic iron works are at the village of Edison, on the summit of Iron mountain, Sussex county, N. J. One statement is to the effect that ore assaying but 15 per cent of iron can be worked at a profit. Six years of work, nearly $4,000,000 in money, more than half of it spent in experimenting, represents the cost. The ore is mined about 400 yards from where it is treated. After passing between the first pair of rollers, which are four feet in diameter, studded over the entire surface with teeth about six inches long and operating with a space of fifteen inches between them, the ore is conveyed in an endless chain of buckets to the top of a building about eighty feet high, where the second pair of rollers, somewhat smaller than the first and without the teeth, are located. The ore emerges from the second pair, that which has started on the journey in the shape of large boulders, some of them weighing a half ton, coming out in the form of powder as fine as the finest flour, in which no grit can be felt. "The time used in accomplishing this wonderful transformation is about five minutes." The separators are a series of revolving electro-magnets about fifty in number. The crushed ore is distributed to the various separating machines through chutes from the top of the building in which they are located. Every particle of iron in the mass clings to the magnets, while the refuse, be it of whatever nature, either sulphur, quartz or flint, drops on another endless belt, which conveys it to the cars, on which it is carried to the refuse dump. When the magnets have taken up all they will hold the current is turned off, they cease to act as magnets, thus releasing the iron which has clung to them. This iron then drops through chutes which emerge at a point beneath the separators, from whence it is carried in an endless chain of buckets to the bricking house, to be formed into bricks by hydraulic pressure and again carried on by conveyors to the waiting cars on the branch railroad.

Notes on Platinum.

The constantly increasing demand for platinum in the arts and manufactures of the world and the present limited sources of supply have in recent years greatly enhanced the price of the metal. Because of the peculiar and valuable qualities of platinum it is believed that the consumption of the metal would be greatly increased if the supply was sufficient to materially lower the cost.

Contrary to popular impression, platinum and associated metals are widely distributed, although they have thus far been found in paying quantities in but few localities. This condition is perhaps largely due to the higher intrinsic value of gold and to the limited acquaintance of prospectors and miners with the means of identifying platinum ore and of its economic separation. Up to the present time the platinum of commerce has been obtained entirely from alluvial deposits, although it has been reported in limited quantities *in situ*. About 80 per cent of the present supply is derived from the alluvial deposits of the Ural mountains, but there are few, if any, of the gold-bearing gravel beds of the world that have failed to yield platinum, and it is more than likely that large quantities of platinum ore have been thrown away with the black sand washings from gold placer deposits. The distribution of the ore may in fact be regarded as practically coexistent with gold placer deposits, as is evidenced by the following list of localities, except Russia, that have yielded the ore in varying quantities: In California in nearly if not all of the gold-bearing gravel and sands; in Oregon, Georgia, North Carolina, Alaska, on the Yukon river, Canada, British Columbia, Mexico, Colombia and Brazil, South America, and Australia.

The genesis of native platinum is not well understood. In two cases it has been reported as found in quartz veins, but these reports have never been verified, and the theory of deposition from solution based upon them is rendered extremely doubtful by the known insolubility of the metal. The undoubted occurrence of platinum *in situ* are in California, Russia, Brazil, New South Wales, Canada and Colombia.

Platinum ore is usually found in the form of rounded or flattened grains or "sand," occasionally in irregular lumps of the size of peas; large nuggets are very rare—the largest as yet found weighing twenty-one pounds.

The ore has a metallic luster and is distinguished by its steel gray color, shining light gray streak when rubbed on a hard white surface, high specific gravity (16 to 19), infusibility in the hottest blast furnaces and insolubility in any single acid. It is not affected by borax or salt of phosphorus before the blowpipe, except in the finely divided state, when reactions for iron and copper may be obtained. It is soluble only in hot nitro-hydrochloric acid.

Platinum ore is a complex body consisting of the metal in combination with varying proportions of the other members of the platinum group, such as iridium, rhodium, palladium, ruthenium and osmium, together with from 4 to 20 per cent of iron. In alluvial deposits the ore is generally associated with iridosmine (a native alloy of iridium and osmium possessing a degree of hardness superior to that of hard-tempered manganese steel), magnetic iron sand, chromite, garnet, epidote, and often with zircon, serpentine, ilmenite, peridot, quartz, diamond and chrysolite. Russia is the only country, excepting possibly New South Wales, that at the present time mines platinum ore for itself alone.

In the former country the platinum-bearing sand is found at depths of between 6 and 40 feet, the pay streak, averaging less than 1 foot in depth, resting directly on serpentine bedrock. In New South Wales the pay streak is from 60 to 150 feet wide and underlies a loam bed 60 to 70 feet deep, the ore occurring in the crevices of the bedrock and in the gravel resting thereon.

The method generally adopted for extracting the ore is to pass the sand and gravel with water through puddling machines or revolving conical screens; the platinum and fine sand pass through into sluice boxes beneath, while the coarser materials are discharged at one side. The contents of the sluice boxes are washed in the usual manner, and when gold is present in paying quantities it is removed by amalgamation with mercury, the platinum remaining behind. Experience shows that it is seldom profitable to work mines yielding less than three grams of platinum ore to the ton of gravel. The average yield of the richest Russian mines is about six grams per ton.

At the present time Russia is the greatest producer of platinum in the world. It is estimated that the output of platinum from Russian sources is nearly fifty times greater than that of the rest of the world. Nearly 6000 kilogrammes of this rare metal is now placed on the market per annum. Russia, however, confines its attention to merely mining the ore, which is found entirely in the southern Ural district. Germany imports the ore and makes it up into metal, so that what metal Russia requires she has to buy back again from Germany.

At the present time raw platinum costs £45 per kilogramme. It used to be thought that platinum ore would be a prolific source of iridium, but the

anticipations have not been justified, this rare metal being only found in small quantities. Last year only 4.1 kilogrammes were obtained.

Future of Minook Creek.

Fifteen years ago an expedition left San Francisco for the purpose of investigating certain rumors of the existence of gold on the Yukon river, Alaska. It was probably the best organized and equipped prospecting party that ever entered Alaska, and consisted of forty-five veteran miners. At its head were two brothers whose names are well known in mining circles, Edward and Eff Schiefflin, the discoverers of Tombstone, Arizona.

Proceeding to the mouth of the Yukon, they built a steamboat called the New Racket, and journeyed up the great river as far as the trading post of Nuklukayet, a short distance below the mouth of the Tanana river, prospecting with greater or less success along the way. At Nuklukayet they spent the winter, and the next year they ascended still farther to a region where the Yukon cuts through the Lower Rampart mountain range after emerging from the vast plains known as the Yukon Flats. Here they prospected, and, in fact, took out some gold in the season of 1883 from the bars of small streams that entered from the south and east; but in the end the Schiefflins returned to the States with the idea that Alaska would never become a great mining district on account of the great difficulty of living in its inhospitable climate.

Since this visit, which was the first time that mining had been attempted in the interior of our northwestern territory, spasmodic efforts have been made to find gold in the same Lower Rampart region, but generally with little success. In fact, the discoveries of Forty Mile and Birch Creek districts farther to the east had attracted new-comers and retained miners and prospectors. However, in the spring of 1896, a Russian half-breed—John Minook by name—in company with O. C. Miller and George Sinclair, all of these men old prospectors, decided that there was "good ground" on one at least of the three creeks upon which the earlier party had worked. The creek had formerly been known as Klanarkakat, which in the Mahlemute dialect means "small stream fit for little boats;" but with the discovery of gold it was named in honor of its discoverer, "Minook creek."

Minook or Munook creek has recently received a little boom, and toward it will drift much of the outflow from the Klondike. The new district is within American territory, 300 miles below Circle City at approximately lat. 65 deg. 15 min. N. and long. 151 deg. W., or a little below the middle portion of the Yukon river. The creek, which, with its branches, is said to be as much as thirty-five miles long, enters the Yukon from the east, out of the Tanana hills.

It will be remembered that it was the reports of the natives that led Cannack to make the discovery of Klondike over a year ago. The first discoveries in the American Birch Creek district were also made by two half-breed miners, and this creek owes its discovery as a gold bearer to another half-breed. Generally, the importance of the native ceases with the mere announcement that he has seen gold in such and such a creek, for neither the Stick Indians of the upper Yukon nor the Mahlemutes of the lower seem to be capable of the steady application to work that Alaska placer mining demands. Yet, Minook creek forms an exception to this rule. On the discoverer's claim only native labor was employed a year ago, and some two or three thoroughbred natives had become so infatuated with mining that they staked claims on their own account.

On Sept. 1, 1896, the United States Geological Survey party arrived at the mouth of Minook creek, and the three following days were spent in an investigation of its valley. At that time there were probably ten white men at work. There had been a very mild stampede from Circle City, but operations had not gone beyond the stages of prospecting or the staking of claims, except in a few cases. One of these was that of the discoverer himself, who had opened up and was ground sluicing new ground, and had before this made a cleanup which netted him $100.

Locations of placer claims were made up the main creek and its branches, Little Minook and Hunter creek, for six miles, but above that point most of the men thought that no "good ground" could be found, although, on the other hand, some thought that the round, worn character of the gold showed that it had been transported considerable distance, and were preparing to prospect the different branches to their heads. In addition to the placer claims, two quartz ledges had been located. No mining in quartz had been done further than opening a tunnel into one of them.

Whether Minook creek will become an important gold producing district it is too early to say. It may be that the decision of the first prospecting party will be borne out by the investigations now going on. The overcrowding of the Klondike region, however, where, as is well known, all claims have been staked, will lead to a migration into American regions, during which all there is in Minook creek and other undeveloped portions of Alaska proper will be laid open.

The Jeffrey Portable Sand Elevator and Screen.

The accompanying illustration is a view of the Jeffrey portable sand elevator and screen in use at the plant of R. L. Shoemaker & Co., Franklin Station, Ohio, destined for digging and screening sand direct into the cars from the bank. The frame is made in two parts, the lower or platform being mounted on truck wheels set to standard railroad gauge, while the upper or main portion is pivoted on the lower one, giving it a complete radial adjustment. The machinery is mounted on the upper portion and consists of an elevator, screen, engine, boiler and the necessary driving connections, including also an arrangement for propelling the whole by power. The elevator, which digs its own load, is of the continuous Jeffrey bucket type, the buckets being provided with truck wheels, which travel on suitable guides in the angle iron ladder frame, thus reducing the friction as well as the wear to a minimum. The elevator is pivoted at the top and is raised and lowered by means of hoisting drums, ropes, pulleys, etc., giving it a vertical adjustment, which, together with the radial adjustment, makes it possible to reach a large area of sand without moving the machine. The sand is delivered by the elevator upon the shaking screen, the finer product passing through the meshes into the car below, while the coarser material is discharged over the end into a car on the next track.

JEFFREY PORTABLE SAND ELEVATOR AND SCREEN.

The screen is also pivoted so the turning of the elevator within certain limits does not affect its relative location with the car. The screen is usually provided with two or more interchangeable sections of wire cloth, so the size of the product can be varied to suit the market. This machine can be operated by two men, one to look after the machinery and the other after the supply to the cars and other details. It is practically automatic, requiring but little hand labor, except when cleaning up. Its capacity is anywhere from ten to fifteen cars per day at this plant, while with but little additional expense the capacity can be doubled.

This machinery is of the Jeffery design throughout, and interested parties can get further details by addressing the Jeffrey Manufacturing Company, Columbus, Ohio.

A New Process.

Henry Rhodes of Denver has a patent for "an improvement in the process of separating gold and silver or other precious metals from the ores." The preparatory method is to grind the gold and silver ores to the desired fineness and then add a certain percentage of common gypsum, also reduced to a certain mesh. To the ground ores and gypsum is added water, and the thorough mixing or churning of the primal ingredients begins. When the mixing or churning reduces the ore and gypsum to a consistency of clay the matter is taken out and moulded into any form desirable and is left to dry, which takes but a very short time. After the bricks or slabs have dried they are ready to be dumped into tanks or other receptacles and the chemical solution is turned on. The matrices being entirely porous, the chemicals permeate the bricks and, the patentee claims, carry away in solution from 95 to 99½ per cent of all gold in the ore.

COPPER MINING during the past ten years has grown to enormous proportions in the United States and become one of the principal industries of the nation. Last year the output of American mines reached 202,640 long tons of refined copper, representing a value of $48,786,080. The increase in the consumption of the metal at home and abroad during those years has been so great that whatever surplus there may have been above domestic requirements found a ready market in some quarter of the globe. Nor does the limit either in production or consumption of the product seem to have been reached. New or enlarged uses for the metal are springing up all over the world. All copper mines, but more especially young ones with an assured future, have become very popular with the investing public, and they are destined to become more so with coming years.

Gold Export Tax in Nicaragua.

Under date of Oct. 23d, M. J. Clancy, consular agent at Bluefields, reports as follows: "The owners of gold mines in this vicinity are exceedingly worried over the decree establishing an export duty of $1 (gold) per ounce on gold ingots and $2 (gold) per ounce on gold dust. The decree was published August 15 in Diario Oficial and takes immediate effect. Gold heretofore shipped from Bluefields has been subject to an export duty of 80 centavos (35.44 cents in United States currency) per ounce."

A letter of the same date from an American merchant in Bluefields who has invested heavily in mines and mining machinery states that: "The decree published July 15 in Diario Oficial has caused consternation among those who have invested capital in gold mines; and this law and the one placing an export tax of 10 centavos (4.43 cents in United States currency) per pound on rubber will gradually kill this coast and ruin the trade we have labored over ten years to establish."

The shipments of gold from Bluefields during the year ended June 30, 1896, amounted to $138,929.14 (United States). The shipments for the year ended June 30, 1897, amounted to $169,565.55 (United States), an increase of $31,636.41.

It is unquestionably true that five or six of the mines in that section are quite valuable, and that there is strong probability of discovering others equally good. Some of the quartz specimens have been rich enough to interest United States capitalists, and five or six mining experts have visited the country during the last year. An expert arrived in July last whose salary is $30 a day and expenses. This salary, perhaps, may seem to some persons rather small for a mining expert; but it is $30 in gold, and even capitalists do not pay $30 a day without some hope of getting it back. Three or four leading merchants in Bluefields have had faith in the productiveness of mines on the Atlantic side and have invested money. But, while gold in paying quantities has been taken from a few mines, the average yield, as shown by the custom-house books, has not been such as to occasion a rush for the mining districts.

With a yield of $169,565.55 for the year, the daily product (including Sundays) would be but $464.56, or less than 78 cents a day for each miner and prospector. It is reported, however, that an abundance of gold goes out of the country without paying tribute to the public treasury.

The mine owners will probably address a petition to the Nicaraguan Government.

THE Homestake Mining Company of South Dakota reports that for the year ended May 31st 395,530 tons of ore were milled. The total product was 110,851 ounces of bullion, the gross value of which was $1,840,674 in gold and $13,112 in silver, a total of $1,853,786. Deducting bullion charges, $10,285, there was left a net return of $1,843,501. To this is to be added $45,938, the net proceeds of concentrates, making a total of $1,889,439. The average return obtained per ton of ore was $4 78. The total expenditure for all purposes except dividends was $1,702,965, an average of $4.31 per ton. Excluding payments for property, the expenses were $3.74 per ton. The accounts show total receipts as follows: Balance on hand June 1, 1896, $263,455; bullion accounts, $1,889,439; miscellaneous, $35,867; total, $2,188,671. The disbursements were: Milling accounts, $424,252; mining, $910,013; blacksmith shop, foundry, tramway, etc., $106,670; general expenses and taxes, $38,920; purchase of property, $223,109; dividends, $375,000; total, $2,077,964, leaving a balance on hand June 1, 1897, of $110,797. One hundred stamps were added during the year and an engine.

AN old miner says: "I see many accounts of accidents to miners from picking out missed shots. It is not necessary to pick out any holes, if loaded in the following manner: Tamp in first powder, put in moderately, with a stick; then put in a cap and fuse; put balance of powder on cap and tamp lightly. If an upper, use a little paper on top of all. The tendency of giant is down and out, not down and up. I have tried it for the last month about six times a day. My holes break to the bottom, and just as good as when holes are filled to the brim with tamping."

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The South Eureka mine and the Blue Lakes Co. have closed a contract by which the mill of the South Eureka will be equipped with electric power. The interested parties have arranged to have the 20-stamp mill, the concentrators, the rock breakers and the blowers operated by electricity within a month. The work of completing the power plant pole line from Jackson north was resumed Monday morning. The South Eureka is the first milling plant in the country to close a deal with the Blue Lakes Power Plant Company for the use of electric power.

The Argonaut mill is nearing completion, the reservoir is about ready for the water supply. F. Taylor will have charge of the mill.

The Pocahontas at Drytown will be sunk 400 feet deeper. It is now down 400 feet.

T. B. Dillon is at the Centennial mine at Dry Creek preparing to reopen the property for a San Francisco company.

The Farrell mine at Middle Bar has been leased to M. Claich et al.

Republican: The Centennial quartz mine, on Deer creek, two and one-half miles south of Plymouth, has been leased by capitalists, and work will be pressed without delay. The Centennial is owned by A. Caminetti.

The shaft of the Oneida is down about 1400 feet. Preparations are being made to repair and retimber the old shaft and take out the water, so that by the time the new shaft has reached the depth at which it is intended to commence drifting, no danger need be apprehended from tapping the old works.

At the Amador Queen a contract has been let to sink another 100 feet. The price is $9.50 per foot, which, considering the hard nature of the formation, is a low price.

The *Record* says Supt. Dillon has formed a company to join him in operating a group of mines in Plymouth district, consisting of the Centennial and other claims adjacent. Machinery is on the way from San Francisco and works will be erected capable of sinking 100 feet.

At the Central Eureka mine the contract work for sinking 200 feet is nearly finished. This will make the shaft 950 feet deep. The contractors have made the 200 feet in sixty days. A station will be made at the 900-foot level when crosscutting and drifting on the ledge will begin. Supt. Thomas is expecting orders to continue sinking 200 feet deeper.

Butte.

The Golden Feather dam in Feather river, near Oroville, blown up last Monday, was built four years ago at a cost of $100,000. It was destroyed by order of the owners because it did not serve its purpose. The dam raised the river 37 feet and backed it up two miles, making it impossible for the company to work the bed of the stream above the dam. That the stream might be lowered, it was necessary to blow out this dam. Another dam will be built higher up the river, so that when it is completed the bed of the stream can be worked. Water to run the hydraulic elevators will be brought in by a ditch from Big Bend. It is locally reported that the company will expend $250,000 on these projects. It is thought that three dams will be built on the river at different points, that the gold from the bed of the river may be secured.

Superintendent Mason of the Morris Ravine mine has discovered very rich pay gravel.

The Rock River mine near Hengy, which Major Frank McLaughlin is reopening, is one of the old mines of that county, and the *Register* says in times past it has yielded the richest rock ever taken from a mine in that section.

The *Register* figures that 1000 men are employed in the mines of Butte county, and that the gold yield for the year aggregates $1,416,000. In '96 the county was credited with a gold yield of $749,000.

Five miles southwest of Oroville are the mines of South Thermalito—1500 acres—where many prospect shafts have been sunk on the land, nearly all indicating good paying gravel near the bedrock. From 8 to 10 feet of earth must be removed ere this pay dirt is reached, and novel methods have been resorted to to move this vast quantity of dirt. In some of the diggings it was moved by wheelbarrows, in others by wagons, while in still others cars pulled by an engine were utilized. Crouch & Sutherland, the owners of 1200 acres of this land, are having a big dredger made to move the dirt expeditiously. It has been estimated that this earth can be handled, washed and the gold extracted for five cents per cubic yard.

Calaveras.

The Carson Creek mine has been bought by W. H. H. Hart, A. L. Hart, L. P. Drexler and other San Franciscans. There is a 40-stamp mill on the property, also chlorination works and an extensive equipment and a shaft 700 feet in depth. The ore is low-grade, yielding $5 or $6 per ton, and it is estimated that it can be taken out and worked at a profit. The old company got into trouble some years ago and the mine was shut down. Subsequently the control passed into the hands of four of the principal creditors, one of whom was a lumberman and another a machinery dealer. The San Francisco men have been trying for some time to get the mine and came near making a deal a month ago. They wanted forty-five days' time in which to pump out the mine, which had filled with water and examine the ore. This was refused and a sale under foreclosure was ordered. W. H. H. Hart secured an injunction, which was issued at the instance of one of the creditors, and thereby tied up the sale. Subsequently the parties decided that rather than stand the expense of protracted litigation they would all sell out to the Hart syndicate, and have done so. The price paid for the mine is said to be in the neighborhood of $125,000.

C. W. Pomeroy and A. E. Pomeroy own the Mt. Timolus quartz mine; in 1894 they bonded the mine to H. H. Bell. Bell, in his operations on the mine, placed thereon a hoisting works and a mill, but nothing was said in his agreement as to the right to remove these improvements in the event that he did not purchase the mine. In 1895, Bell abandoned the mine and commenced to tear down and remove the machinery and buildings, when he was stopped by an injunction sued out by Pomeroy. On the trial in the Superior Court, Judge Gottschalk decided that as the agreement was silent as to any right to remove the improvements, they became a part of the land and belonged to Pomeroy. The Supreme Court affirms this judgment. The case virtually decides that if a written agreement does not permit machinery and improvements to be removed on the termination of the bond, that they become the property of the owner of the land and cannot be taken away.

The *Prospect* says that the Shenandoah Mining & Development Company will resume operations on their property in Mill Valley district, above Jesus Maria, under the management of W. P. Wrixon.

Prospect: W. T. Harris, who some time since bonded the Foot and Thompson mine, reports outlook of the property satisfactory. He has now been running ten of the twenty stamps for eight days and will clean up nearly $100 per day, besides one-half ton of sulphurets saved each day, which run well.

Thomas Peachy reports the Hog Pen mine, at Angels, now down 40 feet, the ledge showing 6 feet wide; 150 tons of ore on the dump will run $30.

J. Wickman has bonded the Wickman mine, near West Point, to the Glasgow Exploration Company.

The Great Western mill at Angels, recently removed from the Rathgeb mine, at Lower Calaveritas, was started this week.

J. McClay has a bound upon the Highland Mary mine, $300 down and $2700 on or before October 1, 1898.

W. G. Drown has a sixty-day option upon the water right of 10,000 inches to be taken from the Stanislaus river at Abbot Ferry, owned by T. G. Peachy. The price named is $12,000 cash.

The Buckeye mine, in Jenny Lind district, owned by B. D. Beckley, has been bonded for $5000 to S. Bishop of San Francisco, to be paid at various times within two years.

The Utica Mining Company, defendants in the suit brought by the Lightner Mining Company to recover $200,000 alleged damages, have filed a demand for a change of venue to Calaveras county, and the motion will be presented on November 8th.

Prospect: The Petticoat, Clary, Pantaloons and Blossom quartz mines, together with rights through gravel claim owned by the Boire Bros., all in the Railroad Flat mining district, have been sold to Louis Rosenfeld of San Francisco. The price paid was $10,000, of which sum $6000 was paid over Monday last, the remaining $4000 to be paid in five months. The properties were owned by W. H. Clary, Sr., Adam Poe and John Champion. The shaft in the Petticoat is now down 400 feet, with a 50-foot chute of rock at the 400 level that assays at the rate of $50 per ton. There is a steam-power hoist on the mine and a 5-stamp mill is to be at once erected. W. H. Clary, Jr., is superintendent.

El Dorado.

Placerville reports that English capitalists have invested $500,000 in the Grand Victory group of gold mines on Squaw creek, seven miles southeast of there. The Transatlantic Mines Purchasing Syndicate, Limited, of London are stated to have bought the property from H. E. Pickett of Placerville and J. E. Wright of Indianapolis, Ind. The first payments have been made, and the property has been taken possession of by J. R. Bell. The reports on which the investment was made showed a large body of low grade ore, the vein being 215 feet wide and the ore running $4 and $5 a ton. The property comprises 160 acres of mineral land.

Nugget: E. H. William and the owners of the Rose Kimberly mine, in Green valley, near Rescue, are preparing to develop that property on an extensive scale. Seventy thousand feet lumber have been ordered. The company is driving a tunnel to tap the shaft to drain it. The force on the mine will be materially increased.

Kern.

Garlock has the following quartz mills, all at work, aggregate capacity seventy-five tons daily, with a total tonnage of 2250 tons per month; average of the ore milled, $76 per ton:

The Garlock, E. F. Garlock, owner; eight stamps, capacity fifteen tons every twenty-four hours; J. R. Hughes, superintendent.

The Maxon, Dr. Maxon of Oakland, owner; C. H. Belcher, superintendent; five stamps, capacity twelve tons daily.

The Visalia, owned by Visalia capitalists; S. N. Coffin, superintendent; ten stamps, capacity twenty tons daily.

The Henry, owned by E. E. Henry of Los Angeles; ten stamps, capacity twenty tons daily.

The Kelly, owned by John Kelly; two stamps, capacity five tons daily.

Parker & McConnell are running a 5-foot Huntington mill; capacity, twenty tons daily.

For the treatment of the tailings and ores there are also the Garlock Cyanide Works, twelve tons capacity, E. E. Carpenter, manager; Smith & Collins' cyanide plant, capacity ten tons a day.

The Rand Mining Company has leased the Visalia mill at Garlock, increased its capacity from five to ten stamps and doubled the well facilities. Garlock mills as yet operate the bulk of Rand district ores. A reduction works that cost $20,000 is in operation on the Alameda mine, Johannesburg. A 10-stamp mill that will require 30,000 gallons of water every twenty-four hours is in process of construction at Johannesburg. Milling at Garlock costs from $6 to $8 per ton; at Cuddeback lake $8 per ton. The hauling to both mills costs from $1.75 to $3. The Rand group, the pioneer mines of the district, have produced over $100,000; the Butte, Kinyon and Wedge nearly $80,000 each. The Napoleon and Merced, new claims in the Stringer district, have each produced over $15,000. The St. Elmo, Petaluma, Alameda, Val Verde and King Solomon group, also the Rocket mine, have also been producers. The total product of gold from the entire district to date is $600,000. The first discovery was made April 22, 1895. The monthly product is now about $100,000. The Wedge is down 415 feet, the Little Butte 385 feet, the King Solomon 270 feet, St. Elmo 200 feet; others have a depth of from 50 to 100 feet.

The Randsburg Placer & Quartz Mining Company's shaft is down 175 feet, without reaching bedrock, and they are arranging to sink 100 feet deeper.

Rooster: The old Patsy O'Brien mine at Havilah has been sold to G. C. Kirby of Los Angeles for $20,000, and the first payment of $3500 made. Mr. Kirby will operate a 10-stamp mill. This property was known as the Warrington mine. The Warrington Company put in a 20-stamp mill and an air compressor, investing in all about $100,000. Later the improvements were destroyed by fire. The mine has been idle for two years.

Los Angeles.

Ten miles east of Acton, at an elevation of 3500 feet, is the Black Cat mine, on which considerable work has been done. A 20-stamp mill is connected with the mine.

Mariposa.

(Special Correspondence).—The Bandarita, Star and LaGrippe mines on the North Fork of the Merced have been bonded by their owner, P. P. Mast of Ohio, to a Scotch syndicate, which will develop them quite extensively. The Martin & Walling mine, also owned by Mr. Mast, is reported as under bond.

R. C. Turner is opening up the Schilling mine in the same district in the interest of owners in the Standard Consolidated Company of Bodie.

At the Virginia the building for the new 10-stamp mill is under way, and excavation for foundations of the storage dam is in progress. Owing to difficulty in securing wood so late in the season, it is said that gasoline engines will be used at the outset. About forty men are employed. This will be the sixth mill erected in the Coulterville district in the past fifteen months.

The Merced Company has reduced the output of the Mary Harrison mine and the mill from 110 tons a day to 70 tons. They are said to be experimenting with very fine screens and correspondingly fine crushing.

New boilers are being added at the Louisiana to meet the increased depth in the shaft and the addition to the mill capacity.

At the Selleck a contract has been let to sink the shaft an additional 100 feet to the 350-foot level.

J. F. Clapp is developing a group of claims just to the northwest of the Selleck property.

Crosscutting for the Crown Lead vein continues at the Red Banks. It is hoped that the ledge will be reached by the middle of December. These properties adjoin the Mariposa grant and are under a bond, aggregating a quarter of a million dollars, to the London Exploration Company, already part owners in the great Mariposa estate. The value of the Red Banks property is conceded to be proved already, and should the present developments prove the surface values of the Crown Lead to continue in depth there is little doubt of the sale being consummated, which would mean much for Mariposa county and probably have a considerable bearing upon the often-promised opening of the grant itself.

A small force is crosscutting on the Penon Blanco.

The Mariposa Electric Power Company has reorganized with Capt. A. H. Ward president and E. A. Wiltsee vice-president, and negotiations looking to the immediate construction of the plant are in progress. The company has secured a tract of land covering both sides of the Merced river, in a narrow canyon about six miles above the old Benton mills. Surveys for canals, etc., have been made and the plats filed at Washington to secure the right of way have been approved by the Secretary of the Interior. Provisional contracts for sale of power are already made in sufficient amount to yield a handsome revenue on the estimated cost of the plant, which will be within easy reach of all Mariposa and the southern part of Tuolumne counties.

A suit of considerable interest to mining men has been started in the Superior Court of this county under the title of Reynolds vs. Bruner. Some years ago Reynolds relocated an abandoned mine and has continued ever since to work it and has developed a property of considerable value. About a year ago Bruner bought up a defaulted school land entry which ante-dated Reynolds' location, and obtained a State patent to the whole section 36, including Reynolds' mine, with the value of which Bruner was well acquainted. Reynolds now brings suit to quiet title. Frank H. Gould and Gavin McNab have the plaintiff's case in charge and it is expected that some valuable decisions may be arrived at before the case is concluded.

Mariposa, Cal., Nov. 1st, '97.

Nevada.

The great incline that the Red Dog Mining Company has been digging for three years has been pushed into the old channel that, at other places in the immediate vicinity, has given such large quantities of gold. If the gravel is satisfactory a mill will be erected.

D. L. Calkins is running a 300-foot tunnel to work the gravel lead on Selby Flat.

Transcript: At the Phœnix the new hoisting and pumping rig is in place. The trench is completed for the 4500 feet of pipe. Manager Shockley expects that everything will be in readiness to start by the 20th inst.

The Bellefontaine is still drifting from the bottom of the shaft that was sunk 100 feet below the tunnel. The ledge is only 11 or 12 inches thick, but is of high grade. The milling portion pays over $30 a ton.

Placer.

The Pioneer directors make the following statement in relation to the vein in No. 4 tunnel: "At the time we left it was 270 feet in length, averaging 5½ feet wide, and yielding from $10 to $40 per ton. In the opinion of the superintendent there was every indication of the pay chute extending a considerable distance farther north. The vein is a strong and well-defined fissure, and is now well opened and in condition for stoping, so that all the ore which is necessary for running the mill to its full capacity can easily be obtained (40 or 50 tons daily) as soon as the rainy season sets in, so that there will be plenty of water to run the mill."

The Pioneer Gold Mining Company has ordered a survey for a new tunnel on the 1500-foot level to strike the vein at the No. 4 tunnel at the 1000-foot level. The foundation for 20 additional stamps has also been ordered and the directors recommend the building of a chlorination plant to treat its own sulphurets. In the spring another compressor will be added, and those now in use will be moved to the new location near the river. Then the mill, as well as the drills, will be run by air.

A Forest Hill report of the 2nd says workmen employed in the long tunnel of the Eureka gravel mine have broken through the rim rock and came upon the bed of gravel for which the company has been tunneling for some time. "The workmen made their discovery at 3 o'clock this morning and to all appearances have struck rich gravel." Felix Chappellet of Oakland, Cal., is at the head of the enterprise, and in spite of the opinions of many prominent mining men that there were no gravel deposits where the Eureka Company was working, Mr. Chappellet continued his operations and staked his money and professional reputation that his judgment was good. The country is a very hard one in which to prospect, it being covered with deep lava deposits. The Eureka people have always had faith in their investment and own 4000 acres of land along what they believe to be the channel. They have in this manner secured seven miles of the channel, and the amount of gold contained ought to be considerable.

Plumas.

At the Star Plumas mine on Little Bear creek, men under the superintendence of F. D. Rood are busy laying pipe. A flume to convey water to the pipe is being erected. A good road, three miles of which is graded, has been made to the mine.

E. A. Davis of San Francisco has bonded the Johnny Bull mine for $20,000 for ninety days.

San Bernardino.

A strike has been made in the Rose mine between the 800 and 900-foot levels, enough ore being in sight to keep the 10-stamp mill running for years.

San Diego.

The receiver of the Golden Cross Mining & Milling Company at Hedges has filed his report. Ninety-five stamps are now in operation, employing 177 men. The debts of the mine have been paid, and there is now on hand over $50,000. It represents the profits of three months' operations. The report states that large bodies of free milling ore are in sight.

Santa Clara.

Last Thursday Commissioner Hermann of the General Land Office made a decision in reference to the Guadaloupe mine, in contest with various agricultural claimants, and claimed by the Santa Clara Mining Association as a portion of the Guadaloupe quicksilver mining claim. They contended for the whole as one compact body, while the agricultural claimants claimed separate tracts. This land fourteen years ago was decided by the Secretary of the Interior to be mineral, but the claim of the mining contestants being subsequently declared invalid, the agricultural claimants renewed in 1893 the contest which has since been waged. The Commissioner affirmed the decision of the local land office at San Francisco upon the facts, and held the lands are agricultural.

Shasta.

The Laconia Mining Company of San Francisco is capitalized at $100,000 and will operate in Shasta county.

At Harrison Gulch the Midas Mining Company will soon commence work on a cyanide plant, near their 10-stamp mill. L. Powers of Wildwood has the contract for foundation timbers.

Siskiyou.

The deed for the sale of the Bunker Hill mine was filed in the recorder's office this week, although the sale was made some time ago, the consideration having been $10,000. The Bunker Hill mine is situated on the Klamath, fifteen miles below Happy Camp, and contains 160 acres of ground. A splendid supply of water is obtained from Independence creek, through a large ditch four miles long. Two giants are kept in operation when the supply of water in the creek is not too low. The Bunker Hill mine has been paying well since the present company purchased it, and is one of the best equipped hydraulic mines in the county.

The Espy-Hunter hydraulic mine, four miles north of Yreka, will be worked again this winter, as soon as there is sufficient water in Shasta river to keep the big pump in operation. The total amount of ground to be mined is 200 acres, which will take a number of season's to work out. The owners have experienced considerable trouble in the past with this large pump, which is one of the heaviest ever built, forcing the water to a height of 432 feet.

Journal: The Greenhorn blue gravel mine

is to be worked on an extensive scale as soon as winter storms occur to furnish water; three shafts are to be utilized in hoisting pay gravel from bedrock.

The new company now working the old Spencer mine on north fork of Humbug creek intends running a tunnel below the old works 700 feet.

The Katie May ledge on Greenhorn, which has been worked by Bailey & Carrick for some time past, has been purchased by A. Wetzel & Son, and will be developed on a more energetic scale.

A rich strike has been made at the Commodore mine on Barkhouse creek, owned by Quigley & Humphreys. On last Saturday, it is reported, they took out $500.

Trinity.

A strike is reported at the Belle mine, two miles north of the Rawhide. At 200 feet crosscutting is reported to have developed an ore body of 32 feet, in which is a streak 8 feet wide which assays $23 to the ton. A 40-stamp mill is to be erected.

At the Norwegian, just east of the Belle, the average value of the milling rock is $30. It is stated that $60,000 has been produced by the mine since January. Every dollar was taken out of the new shaft, as crosscutting has just begun.

The *Searchlight* hears that Menzel & Pugh have struck a rich chute of ore in their claim on Clear creek, the rock running from $200 to $300 a ton. They are preparing to put in a mill, to be run by water power.

Journal: At East Fork the Enterprise Company are prospecting the Enterprise vein and have men at work on the Lone Jack. They have been stoping ore and now have the bins full and will begin crushing as soon as the custom run has been made in their mill of the rock from the Hoodoo mine.

At the Yellowstone R. A. Skinner, the lessee, has struck a good body of pay ore. The 10-stamp mill will run night and day, and a good cleanup is looked for.

Tuolumne.

Superintendent Tritteabach has surveyed a roadway for a branch line of the Sierra railroad to the Dutch mine. The line will begin from a convenient point on Wood's crossing, and is expected to be completed within the next few weeks.

Independent: At the Mt. Jefferson mine there are two shafts, 80 feet and 100 feet deep. In the 50-foot level in shaft No. 2 milling ore has been taken out that assays $8 per ton. The property is owned by a Boston syndicate. J. M. Mughen is superintendent.

The Sell mine, near Sonora, is to have a 10-stamp mill run by water power.

At the Longfellow Stanley & Co. have been taking out specimen rock, besides milling ore that goes $50 to the ton, from the east 120-foot level. It is stated by reliable authority that Messrs. Roberts, Moore & Mitchell have bonded it to Glasgow men.

Yuba.

The Postlethwaite dredger is slowly working its way up the Yuba. According to a recent survey the dredger is operating in the channel and scraping the bottom at 35 feet in the tough clay and red earth. The gravel is found to be richer in gold as they advance up the river. The machinery runs well.

The Consolidated Nugget and Coronado Mining & Milling Co., principal place of business, Smartsville, proposes to mine for gold and deal in electric light, heat and power.

At Strawberry Valley Supt. Darwin is pushing work on the Berry mine.

At the Independence quartz mine, three miles east of Strawberry Valley, a 2-stamp mill is kept busy.

NEVADA.

The Hawthorne *Bulletin* gives a number of items of interest from the Silver Star mines. The general conclusion is that the mines are holding out and looking well. The Bounce ledge is opened for 350 feet, and averages 3½ feet of milling ore, large runs of which mill $17 right along. A back ledge of smaller size mills $30 to $40 per ton.

Arrangements are being made for the erection of a 20-stamp mill at the new discoveries at Ione.

The Cortez mines will be worked through this winter by Simeon Wenban, the owner.

Salt Lake *Tribune*: Dick Frank came in from Cherry Creek, Nev., yesterday, and at the office of the Consolidated K. C. S. & R. Company in this city delivered forty pounds of cyanide of gold, which represents a brief run at a cyanide plant with which he extracted the yellow metal from dumps that were reared at an earlier period in the history of Cherry Creek diggings. In addition to this, the visitor is developing a mine and operating a small stamp mill about eight miles south of Cherry Creek.

OREGON.

Supt. Vass of the La Bellevue and Con. Virginia mines, near Baker City, says that in the former a connection has been made in the tunnel from the north side of Cabell mountain; that there is a continuous tunnel through the mountain for a distance of 3200 feet on the ledge, which is exposed for a distance of 4500 feet. The development work on the property amounts to about 8000 feet.

At Beekman & Huffer's ledge in Shively gulch, west of Jacksonville, recently 2½ tons of ore were crushed in their mill, and a $1200 brick was the result. Fifty sacks second-grade quartz, milled some time before, yielded $550; 2600 pounds of concentrates smelted in San Francisco produced at the rate of $180 to the ton.

The Baker City *Epigram* says: The sale of the Bonanza mine, the Geiser property, is off. It is understood that eastern parties, who were to put up $750,000 as the purchase price of the mine, discovered that the middlemen were to get a rake-off of $250,000 and this they did not propose to stand, hence they forfeited the $25,000 made as first payment and declared the buy off. This is nothing at all detrimental to the mine; it does not harm its value in the least; neither are the Geisers injured, as the Bonanza is looking better now than ever before and the Geisers do not care a rap whether they sell or not. Their fortune is made anyway. The people who are sore are those who anticipated having a real nice time cutting up that $250,000 among them.

BRITISH COLUMBIA.

A Sandon dispatch says the Noble Five mine, tramway and concentrator have closed down, throwing seventy-five men out of employment. The report comes from a source considered reliable that on October 20th the Sandon branch of the Bank of British North America refused to honor any more pay checks of the company, and served a summons on the resident manager which resulted in the immediate suspension of work. The men were promised that pay checks already issued would be cashed by the company on November 1st. It is said that the debt to the bank is $35,000, and the company is endeavoring to negotiate a loan of $150,000. The mine has the best equipped tramway in the Slocan, erected at a cost of $50,000, and the concentrator plant cost $55,000.

J. H. Suisman of Montreal, of the smelter department of the Canadian Pacific railway, is reported from Nelson as saying that the Canadian Pacific intends to have smelters along its route, and if they are not erected by a private enterprise the corporation or some of the directors in it will construct them themselves. Robson and Slocan crossing have been under consideration as possible smelter sites. Should the company or its directors construct a smelter it will run on custom ores, as the company does not intend to go into the mining business.

The Hall mines directors report the results of the company's smelter operations during a period of thirty-two days ending September 30: Sixty-two hundred and ten tons of ore were smelted, including 522 tons of matte, containing (approximately) 249 tons of copper, 141,860 ounces of silver and 98 ounces of gold.

Shipment of matte and bullion from smelters for the week ending Oct. 30 was: Matte, 80 tons; bullion, 81 ounces; pig copper, 1100 pounds; total value, $79,253.08.

ALASKA.

As previously announced, at the recent meeting of the leading owners of the Alaska Treadwell mine in New York it was finally decided to expend $500,000 in making additional equipments to the property. Three hundred more stamps will be erected at the Treadwell, making 540 in all. On the grounds of the Alaska United, between the Treadwell and the Alaska Mexican, another mill of 120 stamps will be built for the use of the United and Mexican mines. New compressors for the Treadwell and the United are other improvements that have been decided upon.

At present the power for the 240 stamps of the Treadwell and the Mexican plant is sufficient, but for the running of the new machinery an electric transmission power plant, capable of operating 600 stamps, is to be erected beyond the Gastineaux channel. This work will be accomplished in the spring, and when completed it is estimated that the ore of the Alaska Treadwell group can be mined and milled at a cost of less than a dollar per ton. An eight or ten drill compressor will also be placed next season on the Juneau mine in the Silver Bow district.

The Juneau Mining *Record*, in its latest issue, says: "The North American Transportation and Trading Company will send a stamp mill to Dawson on the first steamer going up next summer."

Postmaster W. W. Montague of San Francisco asks that the miners and general public be notified that newspaper mail cannot be sent to the Klondike before next spring, even when it is enclosed in envelopes and letter postage is paid on it. Such large quantities of papers have been received at Dyea that the Department is unable to get them over the Pass, and has issued orders that envelopes containing a newspaper, even though they may also contain letters, are to be sent back to Seattle and held until next spring, when they will be sent by way of St. Michaels.

Two new postoffices the other side of the Chilcoot Pass have been established. One is located at Tagish Lake and the other at Lake Lebarge, and bear those names. Both are in the Northwest Territory.

The pest of Alaska mosquitoes might be mitigated if what an M. D. says can be made to practically work: "I can take a minute crystal of permanganate of potash, drop it in the water containing the bacilli of the mosquito, and the oxidation that takes place will almost instantly kill every atom of life that may be present. I will show you how to kill mosquitoes or show you how to develop them. The quantity is one part to 1-500 parts, and 25 cents' worth will be sufficient to operate on a ten-acre area. A handful will be enough. It may be scattered around, a few crystals at a time, widely apart, and I promise that the production of mosquito germs will be immediately stopped. In my laboratory I have killed the germs in a 1000-gallon tank with a pinch of permanganate. There is no reason in the world why vast sections of swamp land should not be treated in the same way. A little care will save endless annoyance and destroy billions of the insects."

IDAHO.

The 10-stamp mill of the Badger Mining Company at Camp Badger, in Idaho, was started up this week.

In the vicinity of Burke, the Standard has made great improvements.

The Mammoth owners leased the Gem mill this summer, since when the force employed has been nearly doubled, about 125 men being employed.

The Tiger & Poorman Consolidated Mining Company is working about 150 men and turning out about 1000 pounds of concentrates daily for each man employed. The shaft is now nearing the 1400-foot level, with a little improvement in the ore for each additional level. With present condition it can be worked profitably down to 3000 feet.

Wallace *Press*: An English syndicate has a bond on part of the Leslie group of twenty claims, near Sohon Spur. The papers signed call for $100,000. Mr. Everett is to be manager.

Boise *Statesman*: The siphon over the Boise river, for the Twin Springs Company, will be 1700 feet in length, 4 feet in diameter, crossing the river on a bridge 60 feet above the water. The pipe is made of steel varying in thickness from one-eighth of an inch to nine-sixteenths. The sections of pipe are 15 feet long, and weigh from 2000 to 4500 pounds. Where the pipe crosses the bridge it will have to sustain a pressure of about 140 pounds to to the square inch. On the Sheep creek side the siphon will attain a perpendicular height of 386 feet above the bridge, and on the other side 360 feet. In erecting the siphon the pipe will be handled in cars, a tramway being built for the purpose. The joints will be riveted and the seams at the joints caulked. The pipe for the siphon cost $22,000.

UTAH.

From Park City, on the 1st inst., the Ontario Silver Mining Company shipped by express forty-five bars of silver, aggregating 27,978.83 fine ounces.

The *Tribune* says the construction of a mill with which to handle the enormous bodies of concentrating ore already blocked out will be the main issue at the approaching meeting of Centennial-Eureka stockholders, and that provision will be made for its early construction is believed by every person who has ever been admitted to or who is at all connected with the underground workings of the bonanza.

MONTANA.

California has many deeper mine shafts than the Butte district, some being over 2300 feet, but probably no district in the country, except it be the Comstock, Nevada, can compare with Butte in the aggregated depth of its shafts and its underground work in the way of tunnels, winzes, drifts and stopes. The *Inter-Mountain* says its shafts alone, if all together, would make a hole in the earth more than fifty miles in depth, while a conservative estimate of the drifts, tunnels, winzes, stopes or other underground workings would place it at about 750 miles. That this estimate is a reasonable one may be gauged from the fact that careful surveys of the Alice properties show that the total development exceeds twenty-five miles, while the Lexington will probably exceed that number. No man whose business does not call him underground frequently can conceive of the magnitude of Butte's underground workings. The stopes in the big copper properties are bewildering labyrinths, chiseled out of solid rock, and out of which even the experienced miner has difficulty in tracing his way.

But it is not the big producers alone that make up the sum total of Butte's underground workings. There are hundreds of shafts from 100 to 1000 feet deep scattered all over the rich district upon which miles upon miles of work has been done. They are mostly silver properties, abandoned, now, but awaiting the day of silver's restoration. To the pilgrim observer, who views them from the surface, they are but holes in the ground over which he can step at will, but to the men who have expended large sums of money and months, perhaps years, of patient toil in delving for the once precious but now debased metal, they represent much—wasted energy, blasted hopes, and in many cases utter ruin.

The following is an accurate list of the present depth of a few of the mines in operation during the present year. Many others might be added. At many of the mines enumerated below sinking is in progress at present, and by the end of the year several shafts will have neared the 2000-foot mark. Sinking is in progress now at the Mountain Con. No. 1, Green Mountain, High Ore, Mountain View, Pennsylvania, West Colusa, East Gray Rock, Parrot, Little Mina, Gagnon and other mines. The following is the list of a few of the mines operated this year:

	Depth.
Mountain Con. No. 1	1,400
Mountain Con. No. 2	1,500
Buffalo	1,000
Green Mountain	1,600
Anaconda	1,400
Never Sweat	1,400
St. Lawrence No. 1	1,400
High Ore	1,600
Diamond	1,200
Bell	1,500
Poulin	1,200
Mountain View	1,200
Silver Bow No. 1	1,000
East Grey Rock	1,400
Colusa Parrot	1,150
Original	1,000
Parrot	1,122
Gagnon	1,525
Lexington	1,465
Alice	1,500

The following is a list of the number of men employed underground by the largest companies of the district:

Anaconda Copper Co.	3,052
Washoe Copper Co.	110
Boston & Montana Co.	685
Butte & Boston Co.	198
W. A. Clark's mines	165
Parrot Mining Co.	334
Colorado Co.	334
M. O. P. Co.	252
Alice	134
Snohomish	56
Speculator	38
Other mines (est.)	500
Total	5,858

A cablegram has been sent from the head offices of the Diamond Hill Company of Jefferson county, at Glasgow, Scotland, ordering a shutdown of the entire plant for a time. The reason given is that the power that was developed on Crow creek is far short of the amount necessary to run the 120-stamp mill recently completed on the property.

The Mayflower mine, in Madison county, is now the greatest producer of the State, says the Libby *Montanian*. Last year it produced about $550,000, but this year, even if the present rich ore body holds out, it will not yield more than $200,000. The introduction of the cyanide process in many old districts in Montana this season will have an important bearing on the output of next year. In many portions of the State there are bodies of low-grade ore which, it is thought, can be profitably worked by this process.

Eugene B. Braden, assayer in charge of the United States assay office at Helena, has begun the work of gathering statistics for his annual report to the director of the mint of the metal output of Montana. Mr. Braden says the total mineral production of Montana will be greater this year than last. The increase will be mainly in copper. From what information he has obtained he believes there will be less gold, silver and lead than was produced last year, although the decrease may not be great. Several lead producers in Montana have closed down during the year owing to the low price of the white metal. There is little doubt that the copper production will be greater than ever before.

The Michael Devitt mining claim, a five-acre fraction, was sold on the 1st inst. at the referee's sale at Butte for $601,000 to Frank Klepetko for the Butte & Boston Mining Company. The Anaconda Mining Company bid $600,100 for it and the Montana Ore Purchasing Company offered $595,000.

Madisonian: Manager Henry Knippenburg of the Hecla Consolidated Mining Company expects to soon have his smelter running at full capacity. The smelter was shut down in August because of lack of lead ores. A new mine, the Ariada, gives promise of an ample supply. One of the furnaces of the Hecla smelter was started up last week. The Hecla group is owned by a company of Indianapolis men, who have taken out of their mines $2,250,000 in dividends. The Cleopatra mine, the largest of the group, produced, since it was opened up in 1877, $10,000,000. The mine was closed down two years ago, having been worked out. Its ore body, as in other mines of the group, laid in a blanket-like form, which was reached by an inclined shaft that attained a depth of 4100 feet along the lead, or more than 1000 feet vertical depth. The ore body of the Cleopatra was immense and ran high in lead. It averaged throughout all the years it was operated about 30 per cent lead and 45 ounces in silver to the ton. The ore was singularly adapted for reduction by smelting. The company has a large supply of high-grade silver ore on hand. Most of these dry silver ores are from the Cleve, a mine located about one mile below the old Cleopatra. The Cleve is a well-developed property and shows a great ore body, the vein being from 5 to 30 feet wide. The pay streak will average 5 feet wide through that part of the mine already developed. The ore runs about 100 ounces of silver to the ton and a trace of gold.

The Ariada, the mine from which Manager Knippenburg hopes to get an ample supply of lead ore, is located below the old Cleopatra mine, but on a different lead. It is being worked by a shaft 300 feet in the mountain side. Drifting is going on from each side of the shaft and development work is being pushed as rapidly as possible, Mr. Knippenburg working three shifts in the mine.

The pay-roll of the company in July was $23,000 and in August $19,000, being greatly reduced owing to a partial suspension of work because of the shortage of lead ores. It was even less last month than in August, but it is believed will steadily grow larger until its normal state is reached. In years past the company paid out in mining and smelting operations from $55,000 to $65,000 a month. Mr. Knippenburg has been general manager of the company's business seventeen years.

Basin *Progress*: The Katie mine has been paid for. The final payment was made in Helena this week by the Basin and Bay State Mining Company, which now owns the property. The mine was bought in 1894 from M. O'Donnell and A. and R. H. Kleinschmidt for $105,000, which sum has been paid in monthly installments.

WYOMING.

George Doan, owner of the Battle Lake copper mine near Saratoga, recently shipped a carload of copper ore to Chicago, containing 22,524 pounds, which sold for $1,984.34. Freight and other expenses amounted to $175.89, net proceeds, $1,808.47.

SOUTH DAKOTA.

Chicago men have put $2,000,000 into the organization of two new mining companies to operate in the Black Hills and placed an order for a gigantic ore roaster. The Chicago & Two Bit Mining Company and the Great Northern Mining Company are also interested in the Hardin Mining Company of Two Bit, S. D.

J. D. Hardin says shaft sinking has been begun, and it will be prosecuted until they have gone down from 200 to 250 feet, when good paying ore will be struck. They have every reason to think that the Two Bit and Great Northern will pan out as well as the Hardin mine, in which there is now over $1,500,000 of loose ore lying about ready to be smelted. The men who are associated with Mr. Hardin in his mine are also concerned in the companies just formed. They also own the townsite of Two Bit, which is a growing town only three miles from Deadwood. They are about to begin the construction of the largest smelter in that region, at an estimated cost of $250,000.

Deadwood *Pioneer-Times*: The plans for the Union Hill mill and system of ore breaking contemplates one of the most complete stamp mills in the country. The batteries are larger and the stamps heavier than those in use by other companies. The plans are for 1000-pound stamps, while those of the Homestake are 850 to 950. The Homestake has a 200-stamp mill with an average crushing capacity of 3¼ to 3⅜ tons per stamp every twenty-four hours. The Union Hill mill will have 180 stamps, but as the stamps will be heavier

Electrical Progress.

Water Wheel Regulation.

The following is a paper read by Mr. S. N. Knight, of Sutter Creek, Cal., at the meeting of the Pacific Coast Electric Transmission Association, held at Sacramento, Cal., Oct. 20th, 1897:

During the past ten years there have been many attempts to improve regulating apparatus for water wheels, especially in the case of wheels employed to drive electrical generators where close regulation in speed is indispensable, and is especially important when currents for power purposes and for lighting are both taken from the same lines.

Makers of water wheels and regulating apparatus well know the difference between a long and a short supply pipe in respect to the difficulties of regulation, and on this coast we have had the extreme of this difficulty to contend with. In the Eastern States the heads are low and the conduit pipes so short as to scarcely involve the elements of momentum, which is a principal impediment on this coast, where the heads are usually hundreds of feet and the conducting pipes miles in length. The ordinary means of regulation are not applicable under these circumstances.

A long pipe filled with water is a moving solid, less elastic and compressible than steel. It cannot be stopped and started except in a considerable period of time, and, when accelerated, cannot be reduced in velocity except by another period of time, varying in our common practice here from five to thirty seconds, or in proportion to the length of the pipe line from which the supply is drawn.

It is evident that, under these circumstances common throttling devices would be of no use, and that a change of the regulating valve produced by vibration in the speed of a water wheel would fail to have effect, so other methods have to be adopted.

Some makers of high-pressure tangential water wheels employ what are called deflecting nozzles, by which the water is diverted from the wheel when not required, and its energy lost. This method obviates the inertia factor in regulation and permits the pressure and flow in the pipe to remain uniform, but it leads to a waste of water equal to all variations below a maximum load and is too wasteful in any case when water is paid for in volume, or is scarce.

This method is especially objectionable when there are but two or three nozzles of large size, and is less objectionable when there are a large number of nozzles of small size—in other words, the loss of water is as its sub-division and as the size of the jets or streams cut out and in for regulation.

In the case of either throttling or cut out regulation, and when the governing devices are controlled by an electric current from the switch-board of a station, either by hydraulic pistons or solenoids, general regulation is easily adjusted by comparing a scale of the indicated horse power with the Watt meter, and the number of jets or issues can be adjusted to give the maximum power required.

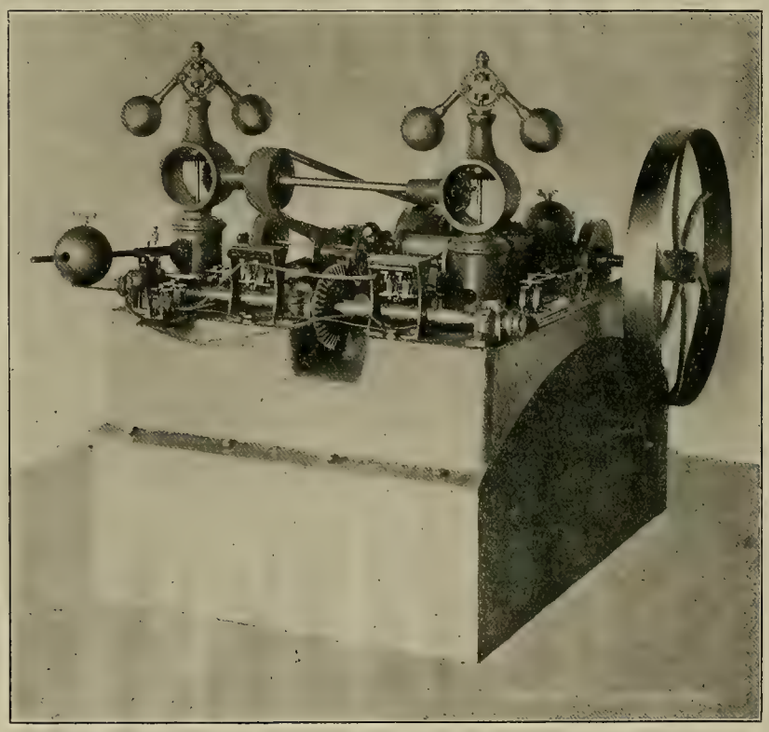
In this manner, if the number of issues be five, and the variations of current do not exceed 20 per cent, all regulation will be performed by one issue or nozzle, and any loss of efficiency in this issue due to throttling would be divisible by five, so the losses of regulation would be inconsiderable.

This method does not, however, provide for inertia and momentum in the pipe line, and at the works of the Pioneer Electric Power Company of Ogden, Utah, where the pipe line is 6 miles long and 6 feet in diameter, the periods of change in the flow of water are supplemented by heavy flywheels, that give out or absorb energy during periods of change. In this plant of 6000 H. P. are surmounted perhaps the greatest difficulties ever encountered in respect to regulation, which is provided for in several ways, one of which is provided for by overflow or relay stand pipes, designed by Mr. C. K. Bannister, chief engineer of the company.

These stand pipes, one of which is within one mile of the station, performs the functions of an air vessel, except that the resistance is as the gravity, and motion, as the square root of the head, and in these respects differs from the action of compressed air. The stand pipe mentioned, in effect reduces the pipe line to one mile in length; but even this mass of water, weighing more than 4500 tons, has to be handled with care. Its properties as to motion can be imagined by comparing it with a large ocean steamer and how such a steamer could be moved backward and forward to adjust the speed and energy of a water wheel.

Fly wheels placed on the water wheel shafts have to withstand an enormous speed of revolution, the strain exceeding the limit for cast iron, but within the strength of the best malleable metals, such as fibrous iron and alloys of certain kinds too well known to need mention.

The writer, who was the contractor for and constructed the hydraulic power plant in the Pioneer Electric Power Company's plant at Ogden, adopted a form of regulating apparatus that was intended to form the principal subject in this paper.



SIDE ELEVATION AND PLAN VIEW OF REGULATING APPARATUS.

This apparatus, of which there are five sets, applied to as many water wheels, giving out 6000 H. P., is partially shown in the engraving herewith, showing a side elevation and plan view.

It seems an extensive and somewhat complicated device, but contains only the elements required to perform the necessary functions and insure regulation under the extremely difficult conditions I have been pointing out.

It is of course impossible, in word alone, or with the aid of illustration, to fully explain the mechanism and the particular manner of its operation. The best I can do is to describe in general terms the main elements and the principle on which they operate.

There are, as seen, two centrifugal governors, driven at the same speed from one shaft. When the speed of the generators change, one governor acts by closing an electric circuit communicating to a magnet, or solenoid, that by means of lever engages a friction clutch and sets in motion machinery driven from the main shaft that opens or closes a throttling valve, or the induction issues of the water wheels. The electric circuit and action of the solenoids is not constant, however; if so, the regulating action would outstrip the change in the motion of the water in the pipe line, so the electric circuit established by the governors' action is broken intermittently by a relay of the action on the water being confined to one-sixth of the time.

If, under these circumstances, the change of speed in the water wheels and generators is not accomplished by the first governor, the second one comes into action, and also closes the electric circuit to the solenoid, which current is also intermittently broken, but at longer periods corresponding to one-third of the time. In other words, the action on the water regulating apparatus is doubled by the second governor. If, however, as is possible under extreme changes, this intermittent action of the regulating apparatus does not produce the required change of motion in the wheels, a third contact is made by the second governor, and so the current and action of the solenoid becomes constant until the speed is checked or accelerated to meet the load or resistance.

This, in general terms, is the method of operating, carried out successfully in the case named, one of the most extensive installations in the world, and certainly one where the impediments to be dealt with have no parallel in modern practice. Had the regulating apparatus been given a free range and continuous action between the extremes, the result would be destructive racing and no useful results could be attained.

In this case the adjustment of the electrical elements provide for twenty-four changes of the rate at which the clutches and water regulating gearing may operate. In other cases this range of adjustment can be less and the regulating mechanism as a whole be simplified, the mode of operating remaining the same.

I may mention that this regulating apparatus was designed and made at the works of Knight & Co., Sutter Creek, California, and while the plans and construction involve a good many intricate problems, these have been less difficult for the writer to deal with than this attempt to describe the work.

S. N. KNIGHT.

Sutter Creek, Cal., Oct. 20th, 1897.

THE San Gabriel, Cal., Electric Company, which is developing water power in the San Gabriel river, expects to be able to supply arc and incandescent lights and power for all purposes by February 1st, '98. At the headwaters of the San Gabriel the company has 150 men employed on tunnel work, nearly all the tunnels, the longest of which is 1600 feet, being worked from both ends, day and night, in eight-hour shifts.

Scientific Progress.

Limits of the Universe.

The announcement that the limits of the universe have been reached by human vision is startling. Prof. Newcomb, recognized as one of the greatest of living astronomers, says evidence is accumulating which points to a probability that the small stars which our powerful modern telescopes have brought into view, do not look small because they are farther away, but by reason of their inferior size. There are no more beyond. In other words, we are actually able to see the boundaries of our universe. Of this universe we know the general form. It has the shape of an enormous disk, the solar system being not far from the center. We may say that this disk, so inconceivably huge, has a diameter four or five times its thickness. As to the length of the diameter we cannot speak with great accuracy, because we are not acquainted with the precise distances of many of the stars. Fifty years hence we shall know a great deal more on that subject than we do at present. We may say that the distance across the disk, from one side of the universe to the other, is 20,000, or may be 30,000 light years. There is a wide margin of guess in the estimate. A light year is the distance which a ray of light will travel in one year. One can figure that out himself, the rate being 186,000 miles a second. It takes a little over eight minutes for light to come to us from the sun, which is 93,000,000 miles away. The light by which we are able to see a very distant star through a telescope may have started from that star 25,000 years ago. Assuming that to be the case, it is 25,000 light years away from us. We can see about 5000 stars with the naked eye. With the most powerful telescope we can see perhaps 50,000,000. There is no telling how many millions more there are unobserved. Presumably there are millions of stars which are dark and therefore invisible, being dead, cold and no longer luminous. All of the stars are suns, the tiniest speck of light we see in the heavens at night being comparable in size with our own luminary. Some of the stars are vastly bigger than our sun, while others are smaller. It is not possible to state the average size of them, but we can say that our solar orb is rather a small star than a big one. The star called Alpha Lyra is one of the giant suns. Another, more familiarly known, is Sirius. The latter has about twenty times the mass of our sun and shines with a hundred times the brilliancy. When one gazes on the Milky Way, he is looking through the disk edgewise from the center. Of course, the Milky Way is observable as a stream of stars continuous around the earth. Our sun is a star in the Milky Way. The Milky Way is the disk of which he speaks. Look out into the heavens on either side, and one will observe that the stars are comparatively few and scattered. One may get a notion of measments from the fact that the radius of the earth's orbit, a line 90,000,000 miles in length, not only vanishes from sight before we reach the distance of the great mass of stars, but from that distance becomes such a mere point that, when magnified by the powerful instruments of modern times, the most delicate appliances fail to make it measureable.

THE human mind is still evolving in the view of Dr. R. M. Bucke, as expressed at the Montreal meeting of the British Medical Association. By slow

and dubious steps taken in darkness our remote ancestors wearily climbed to simple consciousness, he affirms, and after another immense interval they reached self-consciousness. This cannot be the end. Our old mental faculties are some of them fading out, others advancing toward greater perfection, and alongside of them new ones are springing up, some of which will, without doubt, be of overshadowing importance in the future. So-called telepathy and clairvoyance seem to be specimens of such nascent faculties. But of infinitely more importance than these is that, superimposed upon self-consciousness as is that faculty upon simple consciousness, a third and higher form of consciousness is at present making its appearance in our race. We have had occasional and increasingly numerous examples of it for 2000 years. In the course of a few more milleniums there should be born a type of men possessing this higher consciousness, and the advent of this higher, better and happier race would justify the agony of its birth through our past.

"Gold Growth."

In a pamphlet entitled *Gold Growth* (Cincinnati, The Robert Clarke Co.), John Jacob Wagner asks: "Does Nature transmute silver into gold? If it does, can we derive and utilize such hints, from Nature's operation, as will enable us to attain artificial transmutation?" The former question he answers in the affirmative in the pamphlet before us; to the latter he promises a reply "in due time." The basis of the author's argument is that gold in nature is always found associated with silver, and the ratio of gold to silver is not uniform. If silver never occurs without some gold, it follows that the gold has grown from the silver, and the varying proportions found in different mines are due to the length of time the growth has been going on. Hence in the older rocks the proportion of gold to silver is greater than in the later rocks. Pure gold can be separated from silver alloy; but the "fine silver" resulting invariably contains gold. The inference is that the silver is "growing" into gold. This pamphlet belongs to a class of writings by no means rare, the efforts of laymen to clear up facts and theories which are far from clear to specialists who have devoted their lives to them. Granted that the premises of the writer are true, his deductions would have no weight to a chemist. He finds not merely silver and gold occurring together, but many other elements always associated with each other. If gold "grows" from silver, why not potassium from sodium, or bromine from chlorine, etc.? The only difficulty with the theory is that at present there is absolutely no evidence of facts to support it, and the wisest chemists hesitate to philosophize on the problem of the genesis of the elements.

SODIUM is made by the Castner process of decomposing sodium hydroxide electrolytically at Birmingham, England, at the rate of about 2000 pounds per diem, the product being worth about 50 cents per pound. The process has been introduced at two or three places in Germany, and in the United States at Niagara Falls. The cost of making sodium by this process is secret; very little of the metal is sold, the most part of it being consumed by the producers for the manufacture of sodium peroxide. It is said also that a good deal is used in the manufacture of potassium-sodium cyanide, it having been proved that when the yellow prussiate of potash is heated with sodium neither oxygen nor alkaline carbonates are introduced, the product being an almost chemically pure mixture of sodium and potassium cyanides.

IN his report to the Steam Users' Association of Boston, Mr. Hale traces out the amount by which the efficiency of combustion falls short of perfection by reason of the unburned fuel found in the ash-pit and flues. In one set of tests it is shown that the unburned coal ranged from 1.6 to 8 per cent of the total coal stoked, the combustible value being from 0.6 to 3.3 per cent of the total heat value of the coal used. Tests on Pennsylvania coal gave, with grate bars 1⅛ inch wide and 1 inch apart, 16.1 per cent of refuse, whose total combustible value was 4 per cent of that of the coal stoked, these figures reaching respectively 18.7 and 12.6 per cent when the same coal was stoked with a mechanical stoker.

HARTLEY AND RAMAGE, in a paper read recently before the Iron and Steel Institute, give the results of spectroscopic investigations of numerous ores from which it appears that the rare elements are much more generally diffused than is generally supposed. The Bensberg and Pierrefite blendes are richest in gallium, while that of Freiberg is richest in indium. Lithium is found almost invariably in iron ores. Rubidium is frequent in iron ores. It is a marked characteristic of siderites that they contain gallium. Ores derived from the older rocks, such as bauxites from basalts, contain chromium, nickel and gallium. In clay-iron stones gallium is found in twenty-one out of fifty-one specimens examined, chromium frequently and nickel occasionally occurring with it. Thallium is rare in oxide ores, but is frequent in pyrites. Indium is not uncommon in pyrites, but gallium is comparatively rare.

LORD KELVIN contends that the earth might be white hot 2000 feet below the surface or as cold as ice 50 feet below without changing our present climate. He attributes the intensely hot climate of an earlier age to greater heat of the sun.

Mechanical Progress.

New Mine Leveling Instrument.

According to the *Berg und Huttenmanische Zeitung*, an instrument has been designed with which accurate leveling operations may be carried out underground with equal facility in steep and narrow inclined shafts and in adit levels. The advantages presented by this instrument are the rapidity with which it may be set up, as it is merely suspended from the station-point, and the ease with which leveling may be carried out in inclines of 0° to 90°, even when they do not exceed 3 feet in height. Nine illustrations are given by the author, showing the construction of the instrument and the method of using it. Briefly described, it consists of a spirit level screwed on to a good telescope, the whole being fastened by collars to a rod hanging from the station point. The telescope is provided with a diagonal eyepiece for convenience of sighting when the eyepiece comes so close to the wall of the level that direct sighting is not possible. A screw serves to clamp the instrument to the rod at any height. The iron hanging rod is 5 feet long, 0.67 inch square in section, and hollow. From the top downward it is graduated in centimeters, while a vernier fixed to the leveling instrument renders it possible to determine the distance between the station point in the roof and the line of sight. A weight keeps the rod vertical, and a second rod slides inside it and may be raised or lowered and clamped. At the base of the second rod is swiveled a two-pronged fork, which sticks into the floor and prevents the whole from swinging. The total weight of the apparatus is ten pounds. The leveling staff recommended is 20 inches long and 4¾ inches wide, the scale being drawn in Indian ink on Whatman paper. The scale reads to 1 millimeter, and is placed between two sheets of glass inclosed in an iron frame fitted with a hook and an adjusting screw. When the scale is illuminated from the back the position of the horizontal wire of the telescope can be rapidly and accurately estimated to a half millimeter. The weight of the leveling staff is four and one-half pounds. The varying height of the mine roadways necessitates the addition of four to six lengthening rods. These are made of 0.2-inch iron wire bent to an eye at each end. As a rule, four rods 1 metre long, and two rods of half that length, are sufficient. With this instrument underlying shafts and inclines can be leveled with rapidity and accuracy, and adit levels may be leveled at three to four times the speed that is possible when the ordinary tripod stand is used.

Cleaning Parts of New Steam Machinery.

A great deal of damage, annoyance and often serious accidents are caused with steam machinery by neglecting to thoroughly clean the castings, piping and connections before they are put together and to work. A case has just come to our notice, says *Power*, where a good-sized cylinder and piston were utterly ruined by cutting from this cause after a very brief run. A considerable quantity of sand was found in the mud drum of the boiler, and the engine makers claim that the sand with which the boiler tubes were filled while being bent was not entirely cleaned out before the boiler was assembled. It must have been an exaggerated case of priming which would carry sand from the water space of the boiler to the cylinder; but, however it got there, sand had been in the cylinder to an extent that ruined it. When piping up an indicator, especially with side pipes, open the cock after all the connections are made and let steam blow through freely, tapping the pipe at the same time.

If you hold your hand in the jet of steam you will feel the sharp impact of the pieces of scale as they are detached and discharged, and if you replace your hand by a sheet of clean paper you will have a visible and surprising evidence of the amount of stuff that is liable to find its way to the indicator and produce the "explosive water" effect on the expansion line. When one thinks of the amount of this kind of matter which must come from a newly erected system of steam piping the advisability of being able to blow it out thoroughly in some other way than through the cylinder of a working engine is apparent. Core sand in the castings of the engine itself is a fruitful source of trouble, and the careful engineer will use every means to assure himself that this has been thoroughly removed before he relaxes his vigilance upon a new machine.

Rust Preventive.

A new rust preventer is highly spoken of by engineers, who claim that it has at length overcome one of the greatest sources of trouble with which those who have charge of machinery have daily to contend. It has been adopted by the German army and navy and by a large number of European manufacturers. It is composed of greases and volatile oils, which evaporate on exposure to the air, leaving an airtight film or skin, which adheres tightly to the metal and absolutely and permanently prevents the corrosive action of salt air, salt water, rain, snow, dampness, steam, gases, and fumes of acid or ammonia. It is neither a paint nor lacquer, nor a product of petroleum. It is, and remains, absolutely neutral, contains no acid and leaves neither spots nor marks when removed. The coating is transparent, and as it does not dull the appearance of bright metal surfaces it is of special service to machinery builders and dealers who have goods in stock. It does not crack and is not absorbed by dust, paper or cloth wrappers, nor does it rub off in handling, as do oils and petroleum jellies. This quality makes it invaluable for the shippers of machinery. As it stands a very high temperature without melting, it can be used on the bright parts of boilers, engines, etc. A given quantity covers a large amount of surface—one gallon being sufficient to protect 1100 square feet. It is easily applied with a rag or soft brush, and can as quickly be removed with turpentine or benzine, a point of superiority over white lead. It is claimed that an article once coated with it is protected from rust as long as the film is allowed to remain.

Belt Dressings.

The saving of power, belt leather, etc., that follows the use of a good belt dressing on drive or race belts of spinning mules and other machinery is of considerable consequence to any manufacturer, says the Boston *Commercial Bulletin*. In order to detect a good from a poor belt dressing, so far as frictional properties are concerned, an apparatus can be used with benefit. It consists of the upright stand in which a pulley is arranged to turn in a bearing.

A piece of 2 or 3-inch belting should be secured to the floor and the other end to a lever. One end of the lever is studded and the other end held down by a bolt. The pulley may be turned from the main shaft of the mill by putting another pulley on the shaft with the second pulley, and belting the former to a pulley on the mill shaft. The dressing compound to be tested can be applied between the pulley and the belting and the affair started running. The proportion of increased friction obtained by using the belt dressing may be figured out according to the tables in any engineer's handbook, using as a basis the proportion of additional friction which has been brought to bear upon the belt as a result of drawing down the lever by means of a bolt.

Pneumatic Pulley.

The lack of efficiency in the ordinary belts is due principally to the air cushions between the belt and pulley, causing slippage. In the pneumatic pulley this air is entirely eliminated by means of perforations all around the face of the pulley. These perforations are regularly placed in rows parallel to the axis, the perpendicular positions of the perforations of each row alternating with those of the next. The belt closely grips the face of the pulley and operates, therefore, without the loss attending pulleys permitting an air cushion between the belt and the face.

The use of this pulley, it is claimed, enables the use of a smaller and looser belt, owing to the elimination of nearly all slip, which, with the ordinary pulley, is said to be equivalent to a loss of about 10 per cent in power. A more uniform speed can be obtained between the driver and driving element, which is an important feature in high speed work. Less tension on the belt means less oil in the bearings, and smaller belts mean smaller first cost.

Rapid Construction Work.

A record for extremely rapid construction work has been made on the new Fair building, State street, Chicago. The building, which is a nine-story and basement fireproof structure, occupies the whole of a regular city block and was built in sections. One was begun in January, 1897, and finished in March. For the last one, 143x140 feet in size, the excavation was begun May 24th, 1897, and finished on June 21st. On June 24th all concrete piers were finished and ready for foundation stools and basement columns; 4,125,600 pounds of structural iron were erected in twenty-four days; 185,000 square feet of fireproof tile arches were set in twenty-one days; 460 steel columns were fireproofed in five days; 1,946,000 feet of flooring were laid in eleven days; 40,000 square feet of polished plate glass were set in five days; nine stories of elevations, including all terra cotta, sills, caps and terra cotta courses, including 400,000 brick, were set in thirteen days; 60,000 square feet of plastering was finished in nineteen days; five elevators were constructed in twenty-nine days; 20,000 square feet of roofing was done in three days.

Mining Summary.

(Continued from page 435.)

with same number of drops per minute and the ore much softer, the aggregate number of tons per day should equal that of the 200-stamp Homestake mill.

COLORADO.

Only two of Colorado's ten smelters deposit at the Denver mint. These are the Argo and Omaha-Grant. The Globe refinery sends its dore bars to San Francisco, where the gold is separated from the silver. The gold is deposited at the San Francisco mint and the silver is sold for transmission to China and the Pacific islands. The refinery of the Guggenheim smelters is near Jersey City.

The Buena Vista Smelting and Refining Company has been incorporated at Buena Vista, Col., capital stock, $100,000, to operate in Buena Vista.

Republican: Mine companies of the Cripple Creek district are now paying out 12 per cent of the monthly output in the form of dividends, and a sum equally as large is being earned by mines that are closely held and on which no reports of profits are made. A third 12 per cent is going into the treasuries of companies or into improvements on the property and the bank account of individuals, so that it is possible to say with a certainty that of the $1,000,000 produced monthly $360,000 is clear profit to the owners and workers of the big properties. The profits of the prospecting companies and lessees are not to be considered in this, but they would add quite handsomely to the amount.

The dividend list has been growing rapidly of late and is larger now than ever before, although there was a time when fewer companies were contributing to approximately the same total of money paid. That was when the Portland was paying $60,000 and the Victor $20,000 monthly, but with the Victor withholding its dividends and the Portland payments cut in half, there came a heavy loss to be made up, and it is creditable to the camp that in six months time there have come up properties that can and do offset this $50,000 monthly loss.

The total now includes the Portland with $30,000, the Elkton $30,000, Moon-Anchor $15,000, Anchoria-Leland $6,000, Lillie $8,100 and 11 per cent stock dividend equalling $50,000, the Gold Coin $10,000, Golden Cycle $10,000, El Paso Gold $6,500, with the Isabella earning for its quarterly distribution, and the El Dorado Leasing, making eleven companies paying the $120,000. The Independence, Last Dollar, Orphan Belle, El Paso, Gold King and Strong form the second class of profit makers, and the money cleared by them each month will equal the dividends paid the other companies. In the list that is adding to the treasury come the Anchoria-Leland, Victor, Moon-Anchor, Theresa, Vindicator, Mabel M., Gold Dollar, Gold Coin, Moose and others, and the sum of their monthly additions to their reserve funds can be readily computed to above $120,000.

A new departure in the way of milling is to be tried at the old Perigo mine, Gilpin county. The Perigo is a large body of low grade ore of the quartz-feldspar gauge, with less than the usual amount of sulphide The new mill, now almost completed, is equipped with thirty extra heavy stamps with ninety drops or over to the minute. On this arrangement it is expected that the mill will handle 100 to 130 tons of ore per day, at an average cost of 40 cents per ton. The Perigo will be the first stamp mill of its kind in the State. The Gilpin county mill of the old class averaged one ton of ore per day to the stamp.

Colorado Springs *Telegraph*: A company has been organized to construct a mill for the treatment of low-grade ores at Buena Vista. The company is capitalized at $100,000.

A new mill has been constructed at the Hidden Treasure mine, at Lake City, to concentrate the ores of that locality. The mill will be connected with the mine by a 3300-foot tramway and the ore bin at the mill will hold 600 tons. A 4-foot vein of lead and silver ore has been opened up for several hundred feet, which will supply the mine for some time.

The output of the Gold Coin Company's mines at Nevadaville for September amounted to $25,000. The company's total output amounted to many times that sum.

NEW MEXICO.

At Kelly the Iron Mask has a record of high grade ores extracted. The Magdalena district is generally a low grade silver-lead camp, where large bodies, systematically worked, yield big returns. The Iron Mask is high grade gray copper, copper glance, silver glance. Some of the richest carload lots of ore shipped from the mines of the Territory came from this property. A cave-in in the old working shaft, and the general bad condition of its timbers, which made it unsafe and impracticable to continue further work there, has decided its owner, A. B. Keeler, to sink a new double-compartment shaft 50 feet farther east. They are now down 38 feet, averaging a foot a day, with one shift using a steam drill. At present the water is kept down with an ejector, but a large sinking pump is in readiness for an anticipated early increase. The old working shaft contains at present about 120 feet of water.

Silver City *Enterprise*: The shipment of lead ore made from the Rio Grande mine last week ran 34 per cent lead, and 4.4 ounces silver per ton. The 300-foot level on the Texas mine has reached the end of the vein where the shale formation cuts it off at about 150 feet from the shaft. A shipment of three tons of ore was made to the Kansas City Smelting and Refining Co., at El Paso, last week. The stopes on the 300-foot level are turning out more ore than ever before produced by this mine.

Supt. Dawson of the Santa Rita Copper and Iron Co. is shipping two cars of iron per day to Pueblo, Colo. This will be increased to 100 tons per day when the new branch railroad from San Jose is completed.

The ore from the Guadaloupe shows a large proportion of pure cuprite, it runs 30 per cent in copper. About 125 tons per month are shipped.

New Mexican: The question is often asked "Why, with such immense bodies of low grade ore in sight in the Cochiti ledges, ore that would long before this have made a booming camp in Colorado, have four years passed by without witnessing the erection of proper reduction plants in the district?" Until the recent decision of the United States Court of private land claims, the titles of the district have been under a grant cloud. But this dark cloud, having been happily dissipated by the court of last resort, no doubt it is entertained that the capital needed to develop the mines and reduce the output therefrom will be forthcoming before another year.

The New Mexico Iron Mining Company has incorporated; capital stock $1,000,000; Gray, Lincoln county.

ARIZONA.

At the Fortuna mine, Minnehaha Flat, near Prescott, 500 tons of soft porphyry ore are being treated by the cyanide process; and 100 tons have already been treated with a result of $5 gold per ton gross; $1 per ton is said to be the total cost of mining and treating the ore. The cyanide plant is located at the foot of the hill; the vein of decomposed porphyry breaks over at the top of the hill, where it is plowed up with a plow, shoveled into a chute and slid down 200 feet to the cyanide plant directly below. The amount of cyanide per ton so far used is .71 of a pound, worth about 22 cents.

Four mills are within sound of each other near the head of the Hassayampa—the Senator, Chicago Gold Mining, Sun Dance and Storm Cloud Mining Companies. Jos. Carmichael has charge of the Senator mill; it is running successfully on ore from the Evergreen and Snoozer mines. J. Laube is in charge of the Chicago Company's mill. H. E. Armitage is superintending the Sun Dance Company's property, and it requires two or three teams to freight the product of the mill to Prescott.

Of the Commonwealth mine at Pearce it is said that of all the places on earth that an experienced prospector would go to seek a mine the butte where that mine is located would be the last. Standing on the western edge of the Sulphur Spring valley, among various others of similar shape and appearance, is a little hill, barren of any vegetation other than grass, and presenting none of the rugged appearance and metamophic form which prospectors always look for. In this hill is now the most profitable gold mine in America, and perhaps in the world. To verify this declaration the mine works a force of about fifteen men, and the mill six; and the output is said to be nearly $250,000 per month. Everything that is broken in the mine goes for ore; the anomalous feature of a mine without a dump.

The mill is supposed to have a crushing capacity of forty tons per day, and an addition is being erected equal to three times that amount; besides that, several carloads are shipped daily to the smelters.

Five hundred tons of soft porphyry ore from the Fortuna mine, in Yavapai county, are being treated by the cyanide process. One hundred tons already treated showed that it carried $5 per ton in gold. The total cost of mining and treating the ore is $1 per ton. The big vein of decomposed porphyry is mined with a plow, where it breaks over at the top of the hill. There it is shoveled into a chute and slid down 200 feet to the cyanide plant at the foot of the hill.

The *Globe* reports the Kasser Gold Mining Company's mill in Lost Gulch completed. When the new hoist is finished, sinking will be resumed.

Kingman *Miner*: Gaddis, Spear and Dexter have closed a deal on the Union Pass group of mines to Emmens, Strong & Co. of New York. Work will be commenced on the property November 15th.

MEXICO.

Mexico City reports several local American companies are prospecting the Zacatecas gold belt with great success. This belt was first discovered in 1895. The San Cristobal mines, owned by a New Jersey company, will put up another 20-stamp mill on the property.

Walter Renton Ingalls before the American Institute of Mining Engineers: "In addition to the localities in which tin ores have been found in Mexico, mentioned in my paper on the 'Tin-Deposits of Durango,' presented to the Institute in March, 1895, the following should be recorded. I am indebted to Captain Henry Freeman, of Durango, for the notes as to these occurrences: In the Sierra de la Candela, west of the Sierra de San Francisco and El Promontorio (the Llano de Guatimape intervening between the two ranges), cassiterite is found in veins and stream beds. The veins are narrow, and the ores have the same characteristics as those of Potrillos. They were exploited by miners from Coneto in 1882–86, the more extensive work having been done on the northern side of the mountains. In the Sierra de las Palomas, on the western edge of the Otinapa ranch, about 25 miles W.N.W. from the Diablo mine in the Cacaria district, there are several small veins, of which the ore, gangue and country rock are similar to those of the Cerro de los Remedios, near the city of Durango. The latter are essentially the same as the Potrillos veins. In the Cerritos del Olote, in the Murphy grant, about 50 miles W.S.W. from Durango, there are old mines, now partially filled. The veins are narrow and poor; the ore is highly ferruginous; the country rock is rhyolite, with some granite; immense quantities of chalcedonic rubbish are strewn along the course of the veins. In the Cerro Blanco, overlooking the pueblo of Mezquital, 48 miles south of Durango, tin ore is mined by the natives. The mountains are of an eruptive character, rising 3000 feet above the valley of Mezquital, and sloping eastward and southeastward to join the Sierra de Michis. The formation is granite and trachyte. Tin ore is found in ill-defined veins in the decomposed trachyte. The veins are narrow (from 18 to 26 inches wide), but the ore is rich and free from arsenic and antimony, and is smelted easily in the Mexican adobe furnaces. The veins are worked in a desultory manner, between January and June, by the Indians of Mezquital, who refine the product with the aid of resin (*brea*) and the green branches of the red oak, and sell it to the storekeepers of the pueblo at 20 cents (silver) per pound, in 'trade.' At Guanajuatillo, a series of ridges in the Sierra de Michis, about 40 miles S. E. of Cerro Blanco, and 85 miles S.S.E. from Durango, there are several strong veins, in places 10 to 14 feet wide, of very ferruginous tin ore. Captain Freeman says that he smelted 1300 pounds of this ore and obtained 13.1 per cent of fairly clean, merchantable tin; but owing to the situation of the mines, the experiment was unprofitable. In the Cordon de la Sierra de Sacrificio, 68 miles east of Durango, and 28 miles east of Nombre de Dios, on the main road to Zacatecas, stream and vein deposits were worked by *gambucinos*, previous to 1881. The stream-tin was dressed to 50–56 per cent SnO_2, and the lode-tin to 30–37 per cent. The lode-tin is contaminated with iron, arsenic and wolfram minerals. In my former paper I referred to an analysis of metal from Canitas, Zacatecas, which probably came from Sain Alto in the same State, Canitas being the nearest railway point. The localities now mentioned by no means complete the list of tin-occurrences in Mexico. It is found at various places in Guanajuato, whence small lots of metal are from time to time brought into the towns by natives. Aside from the native smelting, the total of which is insignificant, there is no production of tin in Mexico at the present time. So far as information can be obtained, all the occurrences of tin ore in the Republic are in young, highly acid igneous rocks."

SOUTH AFRICA.

The State Mining Engineer of the Transvaal has adopted a system in his statistics of showing all values in shillings and fractional parts thereof, thus indicating the value of the gold left in the ore. For the Witwatersrand he furnishes the following figures:

	Assay Value. Shillings per Ton.	*Value of Yield. Shillings per Ton.*
1. Cyanide process—		
Tailings	20.86	14.27
Concentrates.	130.22	112.29
2. Chlorination—		
Concentrates.	416.73	372.89
3. Siemens & Halske process--		
Tailings.....	19.74	13.74

AUSTRALIA.

At the Broken Hill Proprietary 15,456 tons ore were treated for the four weeks ending Oct. 14, the output from the refinery was 291 ounces gold (estimated), 392,284 ounces silver, 1,256 tons lead, 25 tons antimonial lead (estimated), the copper matte containing 13 tons copper (estimated), and 4,858 ounces silver (estimated). Reduced output caused through fire furnaces shut down.

NEW ZEALAND.

Journal: With a view to finding the efficiency of dredging appliances in dealing with finely divided gold, the following investigation has been made: A sample of fine gold from the Electric Company's dredges, about two grains in weight, which had been sifted through a sieve of 3600 holes to the inch, was again sifted through one of 4900 holes, and the gold which passed through sorted under a powerful lens. One hundred of the smallest of these pieces was thus selected and examined under a microscope. Measured with a micrometer, their dimensions in fractions of an inch varied between 0.009 x 0.006 and 0.003 x 0.002, the mean of twenty measurements being 0.0065 x 0.0042. The hundred particles were then carefully weighed and found to have a mass of 0.097 of a grain. The mean weight of the pieces was therefore 0.00097, or a little under one-thousandth of a grain. With a moderate power only the larger pieces were found abraded, and then only slightly; the smaller were not water-worn, and one specimen was dendritic in appearance. The finest particles are nearly equal in width and depth, and could by no means be termed flaky, but would rather come under the heading of shotty gold, although where edges and angles occur they are well defined. Magnetite in an equally finely divided state with sharp edges is saved with the gold, also transparent fragments probably of quartz crystals. Only one garnet was found. Roughly speaking, it may be said the Electric Company's dredges are saving gold of which it takes a thousand particles to weigh a grain.

The Restraining Dam Committee.

Under instructions from the recent convention of the California Miners' Association, President Neff and Secretary Sonntag last Thursday appointed the following committee to urge the early construction of restraining dams: Ex-Congressman A. Caminetti, Amador county; George H. Ten Broeck, El Dorado; John Spaulding, Placer; J. M. Walling, Nevada; A. M. McDonald, Tuolumne; J. F. Cowdery, Sierra; Louis Conrath, Yuba; J. M. Gleaves, Shasta; W. E. Duncan, Sr., Butte; George C. Sargent, San Francisco; S. P. Lunt, Sacramento; A. B. White, Plumas, and Mark B. Kerr, Calaveras.

The sum of $500,000 is now available for building dams to prevent the debris from hydraulic mines obstructing the navigable streams of the State, particularly the Sacramento river. The United States engineers have not yet selected sites for the proposed dams, and it is to expedite this work that the committee has been appointed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 26, 1897.

592,578.—CARRIER BELT—M. L. Akers, Gooseberry, Or.

592,645.—HAT FASTENER—C. E. Campbell, Portland, Or.

592,692.—VOTING MACHINE—C. Christensen, Oakland, Cal.

592,585.—CAN LABELING MACHINE—Grace & Reynolds, S. F.

592,586.—AIR COMPRESSOR—F. M. Graham, San Jose, Cal.

592,294.—SWITCH LAMP—Jones & Hoke, Tacoma, Wash.

592,634.—BICYCLE HANDLE BAR GRIP—W. Lampert, Sacramento, Cal.

592,519.—PEDAL FOR CYCLES—E. W. Lincoln, Pasadena, Cal.

592,251.—GATE—D. D. Ogilvie, Lee, Nevada.

592,574.—TRESTLE—F. Ring, Portland, Or.

592,533.—CHECK PROTECTOR—Rogers & Hall, S. F.

592,483.—REVERSING GEAR—J. H. Therien, S. F.

592,674.—MOTOR—J. M. Trotter, Alma, Cal.

27,781.—DESIGN, CAN OPENER—J. J. Gallman, Fullerton, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VOTING MACHINE.—C. Christensen, East Oakland, assignor to California Voting Machine Co. of San Francisco, Cal. No. 592,692. Dated Oct. 26, 1897. This invention relates to an apparatus which is designed for mechanically indicating the choice of a voter from a list of candidates, and means for registering the same and totalizing the entire number of votes cast for each of the candidates. It consists essentially of a casing having screw shafts passing horizontally through, these shafts being adapted to engage and advance nuts which are fitted to them, the nuts carrying indicators which move over numbered sheets and thus show an additional vote for each time that the shaft is turned. The ends of the shaft are provided with segmental rotatable keys corresponding to each of the names to be voted for, so that the voter may turn either of the keys and record a vote for the corresponding candidate. There are means for locking all of the other keys so that but one vote can be cast and after the whole vote has been cast, the complete revolution of the shafts may be made and the shafts then locked so that they cannot again be returned. In conjunction with this mechanism is a device whereby votes for independent candidates may also be cast, and a means by which the entire vote for a straight ticket can be cast without operating each of the shafts.

BICYCLE HANDLE BAR GRIP.—Wm. Lampert, Sacramento, Cal. No. 592,634. Dated Oct. 26, 1897. The object of this invention is to provide a handle bar grip for bicycles which is normally rigid against any upward pull upon the handles, but which is made yielding for downward pressure so as to relieve the hands from the constant jar and dumbness caused by riding over rough roads. It consists in applying to the outer end of the handle bar a hollow hinged grip which is so pivoted that it can move vertically with relation to and independent of the bar and in conjunction therewith of springs so arranged that the grip will be normally held up so that the lower part being in contact with the bottom of the bar will be rigid therewith against any upward pull, but the spring will yield so that any pressure of the hands upon the grip will push it down so that there is no actual contact between it and the handle bar which would cause jar, the spring absorbing all of this vibration.

WANTED.—Thoroughly experienced mine clerk, stenographer, typewriter, time and stock keeper, desires a position of a similar kind; age 25; references. Can furnish own typewriter. Address J. C., office Mining and Scientific Press.

MINE SUPERINTENDENT required who is thoroughly practical and experienced in Hydraulic, Drift and Quartz Mining and Milling. Apply, with references, to PACIFIC EXPLORATION CO., 29-30 Chronicle Building, San Francisco.

WANTED — GOLD AND COPPER MINES.

We have customers wanting to purchase good developed Mines. Drawings and Report required. Will mail latter to fill out, when requested. Six to nine months' bond necessary, which need not stop work.

Will also put stamp mill on good mines, for half interest. Address RUSSELL & POOLEY, 449 Wilcox Building, Los Angeles, Cal.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco

A HIGH GRADE Gold and Copper Property, FOR SALE AT A SACRIFICE.

HAVE GOT THE KLONDIKE FEVER. For Samples and Particulars, Address

JOHN P. CLARK,.....Cisco, Placer Co., Cal.

MINE RAILS and PIPE.

We have for Sale a large lot of **16-inch Rails for relaying** and **Four Miles of 10 5-8-inch Casing.** Can also supply New Rails and Pipe, direct shipment from mills.

LEE CHAMBERLAIN & CO.,
256 So. Spring St.....Los Angeles, Cal.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

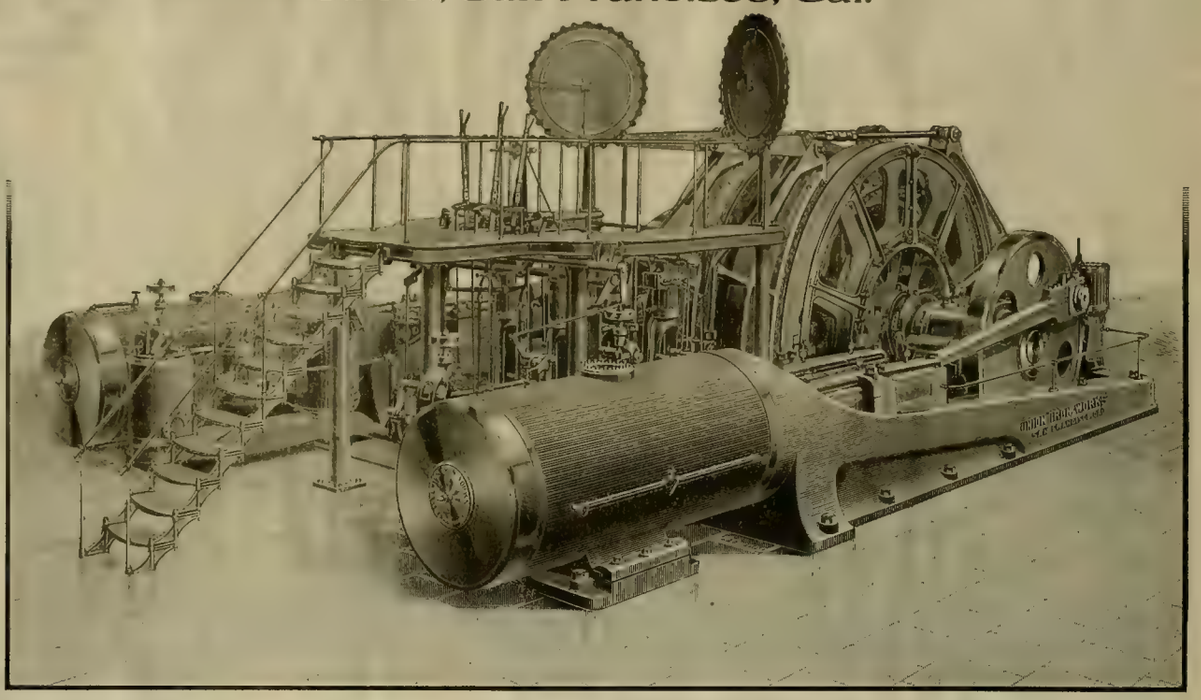
30 in. x 72 in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

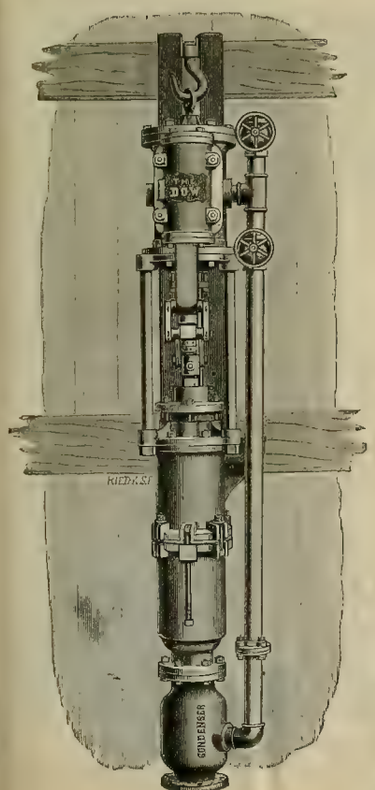
DOW STEAM PUMP WORKS,

OFFICE AND WORKS: 114 and 116 BEALE St., San Francisco.

—— MANUFACTURERS OF ——

Dow's Improved Steam Pumps,

SINGLE OR DUPLEX, FOR EVERY POSSIBLE DUTY.



MINING PUMPS,

Irrigation Pumps,

Artesian Wel Engines,

Independent Air Pump and Condenser,

For Stationary Engines or Steam Pumps.

Power Pumping Machinery,

Speed Governors,

BALANCE VALVES AND PRESSURE REGULATORS FOR STEAM PUMPS,

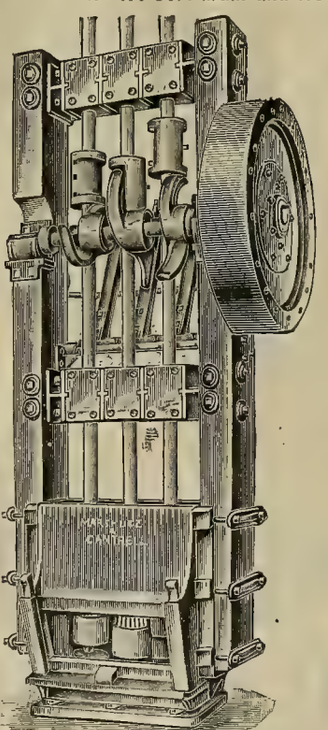
Etc., Etc.

Correspondence Solicited. Send for Catalogue.

L. C. MARSHUTZ. T. G. CANTRELL.

National Iron Works,

N. W. Cor. Main and Howard Sts., San Francisco, Cal.



MANUFACTURERS OF

STATIONARY AND COMPOUND

ENGINES,

FLOUR, SUGAR, SAW AND QUARTZ MILL

MACHINERY.

AMALGAMATING MACHINES.

CASTINGS AND FORGINGS

OF EVERY DESCRIPTION.

All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

Send for Circulars and Price List.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals an Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Coast Industrial Notes.

—Hay sells for $30 a ton in Panamint, Cal., and grain from $45 to $50.

—It is expected that the branch railroad will be completed to Johannesburg, Cal., by December 1st.

—From Eureka and Elko counties, Nevada, fully 75,000 more sheep will likely be driven south into Nye county this winter than usual.

—The Union Pacific Railway from Council Bluffs to Ogden was sold at Omaha last Monday to the reorganization committee for $57,564,932.76.

—An English syndicate has secured charge of the customs revenue of the Republic of Santa Domingo for a period of 100 years, making a loan of $7,500,000 to the local Government.

—It is estimated that 10,000 sheep were shipped from Elko, Nev., last week. From Winnemucca 13,000 sheep are being sent to Omaha, the greater part of them being lambs, for which $1.50 per head was paid.

—The Sierra Railway Company of California has finished laying track to Jamestown. The road is forty-four miles long. Next Wednesday excursion trains will be run to witness the driving of the last spike, which will be made of Tuolumne gold.

—Forty miles of road for the San Francisco and San Joaquin Valley Railroad are being graded from the northern part of Kern county south into Bakersfield. Tracklayers will follow the graders, and it is expected that the new branch will be in operation next January.

—In the Southern Pacific carshops at Sacramento 2215 men are at work. In the company's repair shops at Oakland 816 men are at work. In the repair shops at Bakersfield and Mojave for the San Joaquin division there are 182 men; in the Los Angeles shops, 437 men; at Dunsmuir 63, and in the coast division repair shops 341.

—In the Ojai district, Ventura Co., Cal., are large deposits of asphaltum, which is being marketed in novel a manner. Distillate is pumped up thirty miles in a 3-inch pipe, when the asphalt is dissolved and pumped back in a 4-inch pipe. In pumping the distillate it is raised 1800 feet by force pumps. Then the product is distilled again at the coast.

—A new postal district has been established, consisting of the States of Oregon and Washington. Heretofore Oregon and Washington have been a part of the Pacific Coast district, including California and other Coast States, and the postal inspectors who covered these States had their headquarters in San Francisco. Spokane will be the headquarters for the new district.

—The Southern California Railway Company is reported meeting with encouraging success in its oil development at Fullerton, having recently struck a strong flow of oil in the fifth well at that place. The total output amounts to several hundred barrels daily. The company uses about 800 barrels daily in its locomotives, and will continue development at Fullerton.

—The Los Alamitos, Cal., Sugar Company will enlarge its refinery to 1000 tons daily capacity. The present plant, built for a third of that capacity, has just finished its season's run. It exceeded the expectations of its designers by 100 tons a day. This led to the purchase last month of thirteen square miles of additional lands for the sugar company by W. A. Clark of Montana and an order for enlargement.

—When the California powder pool was formed last spring the Vigorit Company was left out. Later it closed its works in Marin county and purchased a site for the factory at Point Isabel, in the neighborhood of the works of the Stauffer Chemical Company, with which a contract was made for the supply of acids. On the 10th inst., the manufacture of dynamite will be commenced. The capacity of the new works is 300,000 pounds a month.

—Secretary Strasburg, general manager of the business of the Oil Producers' Trustees, reports to the Los Angeles *Times* the affairs of the compact to be in excellent condition. A great deal of oil is being exported, aggregating from 1500 to 2000 barrels per week. The heavier consumers are still holding aloof in the hope that the combination will go to pieces and leave the market congested with cheap oil, but the organization declares that such a contingency is not among the probablities.

—The Hemet dam, Riverside county, Cal., is 40 feet long on the bottom, 260 feet in length on the crest, 135½ feet high at present, 100 feet thick at the base, 10 feet thick at the top. It is built of granite laid in Portland cement concrete. Over 1,500,000 feet of timber were used in it, and this was cut by a sawmill erected for the purpose. Cable tramways were built for moving the stone. The total cost was not quite $200,000. The capacity of the reservoir inclosed by this great work is 3,430,000,000 gallons. The dam will ultimately be increased to 160 feet in height, when it will restrain three times as much water as at present.

—Regarding the discontent expressed with the recent order of the Secretary of War establishing a military reservation in Alaska, with St. Michael, at the mouth of the Yukon, as the central point, Secretary Alger has issued a reply, in which he says that the military reservation at St. Michael was established in the interest of the security of life and property and the preservation of order and of legitimate business interests; that no monopoly was given or intended to be given to any company or persons, and that any proper company or person who desires to conduct legitimate business there will, on application to the War Department, be permitted to do so.

—An approximate estimate of the total number of acres of vacant public lands in the several States and Territories on June 30, 1897, is: Arizona, 54,400,211; California, 43,341,044; Idaho, 45,962,855; Nevada, 61,578,586; New Mexico, 56,983,047; Oregon, 35,892,318; Washington, 17,958,536; Alaska, 369,529,600. These totals do not include vacant lands embraced in military, timber and Indian reservations, reservoir sites or tracts covered by selections, filings, railroad grants, etc.

—The representative of the Hooley-Jameson syndicate, which has been negotiating a loan of £16,000,000 to the Chinese Government on the proposed security of Chinese customs, wires from Pekin that the Government had finally acceded to the terms demanded by the syndicate. The loan will be secured on the balance of the unfettered customs, which yield a revenue of £600,000 annually, and upon the salt and likin taxes in all the provinces, which are entirely unincumbered and amount to about £3,900,000 annually. The Chinese Board of Revenue will stand as security for the bonds, which will be stamped with the seal of the Board of Revenue and Tsung Li Yamen.

—About 500 miles of the Siberian transcontinental railway are completed eastward from Vladivostock, the most southeasterly point in Russia on the Sea of Japan. Chinese and Russian capitalists will construct a line, probably from Pekin, through Manchuria to the same point. A second line will pass down through Manchuria to Port Arthur on the Yellow sea. The Russian Government line will lie wholly in Siberia and on Russian soil. The whole cost of the work is estimated at $261,000,000. Already this coast is doing business with Siberia as a result of this work. Railroad ties, other timber and flour are being shipped from Puget Sound, Portland and San Francisco. The total length of the road from Cheliabinsk to Vladivostock is 4547 miles. Nearly half of this is completed and nearly 1000 miles a year are being built. The largest ferryboats in the world are being constructed to take trains bodily across Lake Baikal, nearly 100 miles wide. There are 70,000 men at work on the line. The branch from the main line direct to Pekin, a distance of between 600 and 700 miles, is under way. From Vladivostock to Nagasaki, Japan, is 600 miles.

Personal.

J. D. McGILLIVRAY will winter at Fort Yukon, Alaska.

M. J. HELLER has returned to San Francisco from Silver Peak.

PERCY MCMAHON, of Colorado, is the new superintendent of the Wedge mine, Randsburg, Cal.

COL. G. W. COOK, representing the Illinois Steel Co., is examining mining property at Boise, Idaho.

GEORGE LAYTON, of Mercur, Utah, is the new superintendent of the Carriso mine, South Pass, Wyo.

CAPTAIN THOMAS MEIN of the London Exploration Company has returned from a business trip to London.

BERNARD MACDONALD of Butte, Mont., is at Rossland, B. C., to examine the Coxey mine, on Red mountain.

SUPERINTENDENT RIVES, of the Golden Cache, Lilloet, B. C., is in San Francisco buying mining machinery.

CLARENCE KING, who spent two weeks examining the Continental and Black Warrior copper properties, near Globe, Arizona, has returned.

J. J. CRAWFORD, ex-State Mineralogist of California, has formed a company to operate the old Richmond mine he has owned for many years.

E. B. PRESTON, whose recent work in gold milling attracted deserved attention, is now assayer and assistant mineralogist at the State Mining Bureau in this city.

EX-SENATOR DORSEY is in San Francisco. He expects to soon have men at work in his Picacho mines, and contemplates building a 40-stamp mill on the Colorado near Yuma.

CHAS. E. UREN of Nevada City, Cal., is at Oroville, surveying for a dam of masonry to be built in the Feather river to enable the Golden Feather M. Co. to exploit the river bed.

L. S. STORRS, geologist for the Northern Pacific Railway, and P. M. Gallagher, his assistant, have completed an examination of the coal fields lying north of Missoula, Montana, and gone East with samples of the coal, which they will analyze and report on.

THOMAS A. EDISON was asked the other day what he thought of those Chicago men who claim to be manufacturing gold from the baser metals. The inventor, it is said, did not reply categorically to the question, but smiled significantly and picked up from his desk a cablegram which had just been received from Italy. The dispatch read: "*To Edison, Orange, N. J.:* Have invented perpetual motion. Will you help me perfect it?" "You will notice," he said, with a far-away look, "that a great many remarkable discoveries are being made this year."

Recent California Mining Incorporations.

San Justo M. Co., San Francisco; capital stock, $1,000,000; subscribed, $5000; T. Flint, D. C. Nichols, W. H. Hart, E. Dexter.

Grapevine Canyon M. Co., San Francisco; capital stock, $100,000; subscribed, $25; P. J. Kerrigan, J. L. Bromley, W. A. M. Van Bokkelen, J. Stadfeld, Jr.

Yukon M. D. & L. Co., S. F.; capital stock, $100,000; $25,000 subscribed; E. F. Seward, F. Lawrence, W. W. Allen, H. E. Lumar.

Ready Gold M. & M. Co., S. F.; capital stock, $100,000; $100 subscribad; W. E. Meeks, D. Fisher, C. Shea, T. F. Burke, J. Fisher.

New Pyramid Q. M. Co., Sacramento; capital stock, $100,000; subscribed, $50,850; F. Elder, C. Rodoni, H. E. Harvey, W. S. Kendall, C. A. Beardsley.

Pasadena and Klondike M. Co., Los Angeles; capital stock, $250,000; T. J. Phillips, C. F. Dandy, F. J. Eddy, H. A. Perkins, C. H. Wright.

California Gold Fields Co., Los Angeles; capital stock, $1,500,000; E. L. Allen, J. R. Manning, J. L. Stanley, D. C. Donoghue, W. T. Allen.

Alaska G. & C. M. Co., San Francisco; capital stock, $500,000; subscribed, $7000; J. Farrell, C. Reilly, P. O. McDonald, O. J. Humphrey, H. J. Knowles, E. S. Griffith, H. N. Humphrey.

Nellie M. Co., Stockton; capital stock, $150,000; subscribed, $5; L. Oliveri, G. E. Wilhoit, F. E. Lane, M. De Vries, W. E. Johnson.

Yukon M., D. & L. Co., San Francisco; capital stock, $100,000; subscribed, $25,000; E. F. Seward, H. E. Lamar, M. E. Allen, F. Lawrence, W. W. Allen.

Recently Declared Mining Dividends.

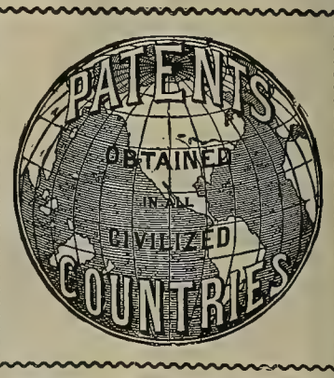
Swansea, Utah, dividend No. 14, $7000; Nov. 2.

Pennsylvania, Grass Valley, Cal.; dividend No. 11, five cents per share, $2,575; payable immediately.

October mining dividends, so far as reported, were as follows:

Alaska Mexican $18,000, Alaska-Treadwell $75,000, Alice $20,000, Bunker Hill $15,000, Calumet & Hecla $1,000,000, Champion $8,500, Dutch $7,500, Elkton Corn $30,000, Geyser-Marion $9,000, Highland $20,000, Homestake, regular, $31,250, Homestake, extra, $31,250, Hope $10,000, Iowa $5,000, Mercur $25,000, Montana Ore Purchasing $40,000, Moon-Anchor $12,000, Morning Star $19,200, Napa Con. Q., regular, $10,000, Napa Con. Q., extra, $10,000, New York and Honduras $15,000, Silver King $37,500, Standard Con. $17,000, South Swansea $7,500, Swansea $500. Total, $1,478,700.

PATENTS



DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

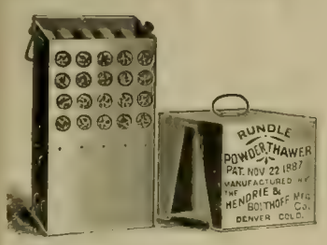
These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

An ounce of prevention is better than a pound of cure.

POWDER SHOULD NEVER BE THAWED BY DRY HEAT.



The Rundle Powder Thawer

Is the only Absolutely Safe device for thawing Giant Powder or other high explosives.

Indorsed by Mine Inspectors and Mining Men generally.

Warm Water entirely surrounds the tubes.

Cheaper Way of Sending Circulars.

DURING the recent Miners' Convention in San Francisco it was noticed that some firms dealing in mining machinery issued circulars that were supposed to be distributed throughout the hall; but of that, probably the janitor of the hall who removed the debris could probably tell better. It is also noticed that those firms now and then get up circulars that they mail, mostly to men who moved from the place a year ago.

It was supposed that everybody understood what a waste of money is always involved in issuing circulars—whether distributed by hand or sent by mail; and while it is evident that those who get out circulars really want to advertise, it is equally evident that they don't know how to get at what they do want. As there appears to be a few who still think that a circular is a good thing and forget that the circulars that they send out, even when received, are always accorded the same fate that they themselves give to any circular that they receive, namely, throwing it away unread, it is deemed advisable to suggest to them a way in which they can have their circulars do them some good.

To those who have mining machinery for sale and feel disposed to cling to the old exploded notion of circulars sent by mail at random to probable or possible customers, it is suggested that they can, without doing violence to their established notions, secure better results in a better way. The following tells them how it can be done, being an illustration of how to do effective circular work at a greatly reduced cost. There are very few circulars that contain more than can be prominently displayed in one page of this paper:

6,000 good circulars, well printed on fine paper, cost, say,	$ 14 00
Envelopes for same,	5 50
Addressing them,	5 00
Postage (sealed envelopes),	120 00
Total,	$144 50

Thus we find that to get 6,000 circulars into the postoffice costs $144 50. This is on the supposition that the 6,000 names to whom the circulars are addressed are those of men likely to be customers of the concern sending the circulars, which is very unlikely, as no one firm can secure a live list of possible customers that would equal in value a list containing the same number of subscribers of a good live paper that is bought and paid for and seen every week, passed around in many cases until it is worn out from the number of readers through whose hands it goes. Now, instead of spending $144 50, which is mostly thrown away, how would it do to take that same circular and put it on one page of the MINING AND SCIENTIFIC PRESS, the cost of which in place of $144 50 would be $42, or less than one-third, with a hundred times the greater likelihood of value? The manufacturer or dealer in mining machinery who will spend $144 50 in an attempt to get his business before 6,000 people, could save $102 50 by putting that same circular on one page of this paper and be sure to get it before 6,000 definite, known men, thus securing a certainty instead of an uncertainty and at less than one-third the old way cost.

If a circular is so good a thing as some seem to imagine, here is a chance for them to make money and save money at the same time and to get what they want at very little cost, and in place of firing a scattering shotgun, they can shoot with a rifle and concentrate all their ammunition that way.

In figuring on the cost of these circulars it is assumed that each one is sent sealed, which involves a two-cent stamp; but even were they sent unsealed they would still cost one cent apiece for postage, which would make them cost $84 50. Herein we show how lovers of circulars can substitute certainty for uncertainty and for less cost to themselves. The force of these remarks lies in their personal application.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman o practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

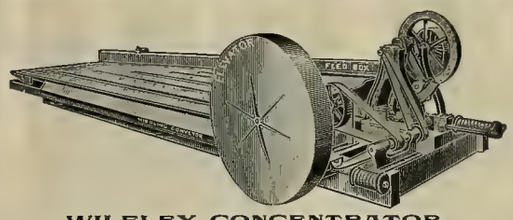
Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.
PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:
1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

Assaying Gold .....AND..... Silver Ores.
By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

Water Pipe for Placer, Hydraulic and Quartz Mining a Specialty. Made up complete, or cut, rolled and punched to be riveted at mine. Well Casing; Oil, Water and Cyanide Tanks; Galvanized Air Pipe; Ore Cars and Ore Buckets, and all kinds of Sheet Iron and Steel Work. Mail orders promptly attended to. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 4, 1897.

Considering the season of the year, trade holds up remarkably well, although to-day, owing to rains, it is slack. The present rain comes down slow and easy, which is considered good for agricultural purposes, as it soaks into the ground, by which a good reservoir is secured for growing plants to draw from. The belief grows that there will be a decided increase in the acreage seeded to wheat and also that seeded to sugar beets. With an increase in acreage put in and favorable crop weather, it is quite reasonable to expect a large increase in the call for agricultural implements, which will cause more work for agricultural machinery works. The outlook is quite promising for next year's business in structural, mining machinery and other iron work, being considerably in excess of this year's. This will put a large amount of overflow work from the big establishments into the smaller works, but to get it close figuring will be the order, owing to strong competition. Those in a position to know of what they speak, say that the call for mining machinery next year will be the largest in the history of the city, and that about all will be for gold mining. If this proves correct, more men will be assured work and the consumption of raw material will be no small item.

The local money market continues easy, making it difficult to place funds on strictly gilt-edge security without sharing asking rates of interest. The very heavy exports by sea to foreign ports, aggregating over $1,200,000 a week, gives a good supply of sterling and exchange to other points, while the heavy shipments of coast products by rail to the East give a good supply of bills on New York and other Eastern centers, but not enough to meet the demand for remitting. This demand has been largely increased by the heavy imports of gold from Australia. It is stated that the retail trade is making close collections and paying up quite well. This allows retailers to meet obligations in this city, which is making the wholesale trade quite easy and admits of many firms not favorably situated to discount their bills at the East. The East reports an active money market, although the call for crop-moving purposes is falling away and the flow of funds is to the money centers on the Atlantic seaboard. A leading New York authority reports that market for exchange as follows: "The market has developed a better tone, and it looks as if the decline were stayed. Bills that have been expected to come on the market do not seem to have appeared, and, on the contrary, there has been a demand from unexpected sources. Money in London continues firm, although the position there seems a little easier than it was. A certain amount of investment of long exchange is going on here and may be expected to continue."

New York Silver Prices.

NEW YORK, Nov. 4.—Following are the closing prices for the week:

	Silver in—	
	London.	N. Y.
Friday	27⅞	58½
Saturday	27⅞	58½
Monday	28	57⅞
Tuesday	28⅛	58⅛
Wednesday	28⅛	58⅛
Thursday	28⅛	58⅛

	Copper.	Lead.	Iron.	Tin.
Fri.	10 85 @11 00	3 85½	10 00@12 25	13 70
Sat.	10 90 @11 10	3 95½	10 00@12 25	13 70
Mon.	10 90 @11 00	3 95	10 00@12 25	13 75
Tue.	10 85 @11 00	3 95	10 00@12 25	13 77
Wed.	10 85 @11 00	3 95	10 00@12 25	13 70
Thur.	10 85 @11 00	3 95	10 00@12 25	13 70

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, ¾ per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	3@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.88½
London Merchants	$4.85½
London Sight Bankers	$4.89½
Refined Silver, peroz. 1000 fine	58½
Mexican Dollars nominal	46

SILVER.—The market sold down the past week, due to freer offerings abroad and a slower demand, due partly to reports that the Straits contemplate adopting the gold standard. What effect, if any, the elections in the Eastern States will have, it is hard to say, for the issue on silver was clearly defined and the largely increased vote for the white metal advocates is quite a surprise. As these elections were not for Congressmen—which comes next year—it is hardly likely there will be any effect, or, if there is, it will be temporary. The last steamer for China took out $87,000 in bullion for Bombay and $53,000 for Hongkong.

MEXICAN DOLLARS.—The last steamer for China took out the largest shipment made at any one time this year. It was $52,549. The market is nominally unchanged.

COPPER.—The market is easy with concessions obtainable on quotations. James Lewis & Son of Liverpool report October 15th as follows: "Good merchantable copper has declined 10s 3d per ton during the past fortnight, the arrival of a large cargo of of Bolleo copper—1620 tons fine—off the coast being the signal for general selling, especially when it was ascertained that though ordered to Dunkirk it was to be brought back to Swansea. Though sold to smelters, this cargo goes temporarily into stock, causing a large increase and counteracting the exceptionally large deliveries of Chili and American bars from the Liverpool stocks. The production of the Bolleo mines for the past quarter is returned as 2892, against 2755 tons for the first quarter of the year. Consumption in England continues large, and would be much larger were it not for the strike and lockout in the engineering trade, the end of which appears to be approaching. In manufactured copper purchases continue to be made for India."

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 2c; ½ and larger, 16½

QUICKSILVER.—Exports to Mexico the past week aggregated 850 flasks. The market is steady at an advance.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market has ruled weak and while some shading is reported, yet large handlers do not quote any lower. The demand at the East is slow.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @ 5 00
Sheet	6 25 @ 6 50
Pipe	5 50 @ 6 00

TIN.—The market is quiet and weak, both on this coast and at the East.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C cake, heavy, per box	$4 10@4 25
" light, "	4 00@—

SHOT.—The market is easy.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do. "	1 65

POWDER.—There is a good demand.

The market is quoted as follows for Hercules: No. 1, from 11½c to 17½c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

COAL.—The market shows a freer demand for household purposes. The call for steam is also quite free. Imports the past week were as follows, in tons: Departure Bay, 4810; Puget Sound, 23,449; Comox, 2,500; Coos Bay, 2025; Newcastle, N. S. W., 2800. Total, 35,165.

COKE.—Considerable foreign has come to hand the past week.

The market is quoted as follows:

Gas Companies'	— —
English, to load	— — @ — —
" spot, in bulk	11 00 @ — —
" in sacks	12 00 @ — —
Cumberland	13 00 @ — —

IRON.—The market is easy from first hands for both foreign and American. The consumption continues free.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	23 00
Salisbury	25 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Garisberrie	21 50	23 00

NAILS.—The market is steady at full prices.

We quote the following basis: 20d to 60d inclusive, wire $2.45, out $2.35.

BORAX.—The market is firm at quotations.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4¾

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

NAILS.—The market is steady.

Wire, carloads, basis per keg	
" jobbing " "	$2 45
Can, carloads, " "	
" jobbing, " "	2 35

ANTIMONY.—The market is steady.

Our market is quoted at 8½c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

So far as we are able to learn our market is practically unchanged, with trade confined largely to jobbing lots. New York advices to October 30th report as follows:

Nitrate soda for future shipment is still rather weak and the market suffers more or less from wider circulation of the report that the producers' combination is not only cracked but broken. Purchases could have been made easily at $1.60 for future shipment and at $1.65@1.67½ on spot, in large way. Crude brimstone for future delivery was a shade weaker, with some sellers of unmixed seconds at $20.75 and thirds at about $1 less. Chlorate potash, prussic acid, tartaric acid, cream tartar and citric acid are rather weak at second hands, but other chemicals remain without quotable change. Business generally is rather quiet.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66°.

ACETIC ACID.—The market is steady at 6 to 10c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steadier from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is only fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is easier.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.35 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is irregular, with concessions obtainable on quotations.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Nov. 4, 1897.

With the exception of a small skyrocket move in Hale & Norcross, which sent it to $1.75 a share, the market has hung around alternating between a sick go-all-to-pieces look and a healthy, strong pull-altogether look for an upmove. Whether the hanging around has been to sell shares or buy shares is one of the mysteries of the game which are only solved by time. To an outsider the market acts very much as if the insiders are preparing for lower prices within the next thirty days, although before this is done the market may sell higher. The low prices ruling for some of the shares indicate that the public is not greatly interested in the market. Take as an illustration, Seg. Belcher, next to Belcher, with equally as good if not better chances for ore, sells at about one-sixth of what the latter brings. Then there is Kentuck, between Crown Point and Yellow Jacket, does not sell for one-third what either of the two latter, and yet it is known by miners that they can strike a good-sized body of ore in that mine when desired. It is also known that before the present superintendent was appointed his predecessor reported high grade ore in the mine. It is quite possible that the change was made so as not to let the facts be known, for the purpose of freezing outsiders out of their holdings. Be this as it may, the present management, so far as the writer can learn, has not been able to find anything except assessments. Then there is Con. Imperial, Exchequer, Alpha and Bullion. The shares in these mines should on merit, if reports are true, and well informed miners believe them, be selling at prices considerably above those ruling. As a rule the work under way in nearly all the mines is not pushed with that energy indicative of a desire to develop them, but it looks to be more for the purpose of killing time and getting rid of assessment money so as to disgust the public still more. There is only one mine listed on the Exchanges that pays dividends, and that is the Standard in the Bodie district. The mine seems to be managed more as an investment proposition than for gambling.

From the Comstock mines the news does not indicate any great degree of activity in any of the mines. Some report a fair degree of activity, while others do not report any or else only sufficient to call it work, but to an outsider it has more the appearance of playing work. Con. Virginia has levied an assessment and others are to follow its example. The money to be raised will help in paying for mine work for at least three months and perhaps still longer, as this mine seems to be economically managed. The letter from Alta and Justice is not of a particularly encouraging character, although they point to more activity before long—probably by next spring. From Overman nothing of particular interest comes to hand. The work is on the same levels heretofore reported. Seg. Belcher continues to raise a few tons of ore, which calls for an assessment probably to pay the milling. In Belcher the work, while quite interesting, does not point to any desire to find much ore, at least in the near future. They are still raising a few tons of ore each week. The work that is being watched with interest is that calculated to strike the continuation of the ore found in Crown Point. In the latter mine they will raise on the rich streak of ore in the hopes of its developing into something of importance. We are not able to learn anything about Kentuck's future work. In Yellow Jacket it is reported they are working only one shift. The work is towards Kentuck, where they feel confident of striking ore. The same reports, with a few variations, were from Confidence, Con. Imperial and Alpha as have come to hand previously.

Considerable interest is being shown in the work on the upper levels of Potosi, owing to the finding of some ore. Last week 112 tons were extracted, assaying over $13 a ton in gold and 16 ounces in silver. They are still in the repairing business in Chollar. It looks as if they ought to be through with it by Christmas, if not sooner. No work in Hale & Norcross. There is nothing new to add to our last week's published reports from Savage, Best & Belcher and Gould & Curry. The work in Con. Virginia is of an exploiting character on the 1550-foot, 1650-foot and 1750-foot levels. Favorable material is showing in the Ophir west crosscrift on the 1000-foot level. They are also crosscrifting in the Central tunnel level. They are still going east on the 1000-foot level of Mexican. They have extracted thirty-three tons of ore from the 1465-foot level which has been sold at $11.47 per ton, net. Some day they are liable to open up the 1465-foot level. In Union there is no change in the work heretofore reported. From Sierra Nevada our advices state that in No. 4 west crosscrift on the 900-foot level the formation has improved. Nothing new comes from Utah or Andes.

From the Brunswick lode our advices continue to report active work in Occidental, with prospects on the 750-foot level looking quite favorable. They will probably start a joint Potosi-Chollar crosscrift on the 500-foot level in about two weeks. Good results are looked for, but it may take well into December before results will be known. The ore stopes on the 400-foot level are about exhausted, but on the 300-foot level ore is being extracted. There was milled last week 112 tons, which went to the ton about $19 in gold and 18 ounces in silver. Active work is being done on the 500-foot and 600-foot levels. Nothing new comes to hand from Savage, nor from the joint work by Gould & Curry, Best & Belcher and Con. Virginia.

The following illustrates the changes of the week:

MINES.	Oct. 28.	Nov. 4.

Assessment Notices.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 28th day of September, 1897, an assessment (No. 8) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 44 Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44 Phelan Building, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 82) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 63) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of November, 1897, an assessment (No. 10) of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from J. F. Cowdery, in the Sackets Gulch Mine near St. Louis, Sierra Co., to deposit tailings in old pits; from the Santa Clara Mining Co., in the Richardson Ranche Mine near Shasta, Shasta Co., to deposit tailings in Clear Creek; from W. T. Sherman and O. F. Cays, in the Canada Mine near Fort Wine, Sierra Co., to deposit tailings in French Ravine; from R. Cordez, in the Mosquito Mine near Comptonville, Yuba Co., to deposit tailings in a ravine; and from C. N. Foote, in the Montalgo Mine near Uno, El Dorado Co., to deposit tailings in Cedar Creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 8, 1897, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from T. Larimore, in the Conrad & Wheeler mine, near Forbestown, Butte Co., to deposit tailings in a ravine, and from Edward C. Rigney, in the Round Butte mine, near San Andreas, Calaveras Co., to deposit tailings in Batista creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 15, 1897, at 1:30 P. M.

Weber Gas & Gasoline Engine Co.
Kansas City, Mo.

Gentlemen:—

You shipped us, last month, to our mines at Sierra Majada, one 30 horse power gasoline hoist. I wish you would make for us, and ship as quickly as possible, a duplicate of this hoist for our mines at Chihuahua, Mexico.

I am Yours very truly,
C. E. Finney

Weber Hoists are Winners.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEARR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

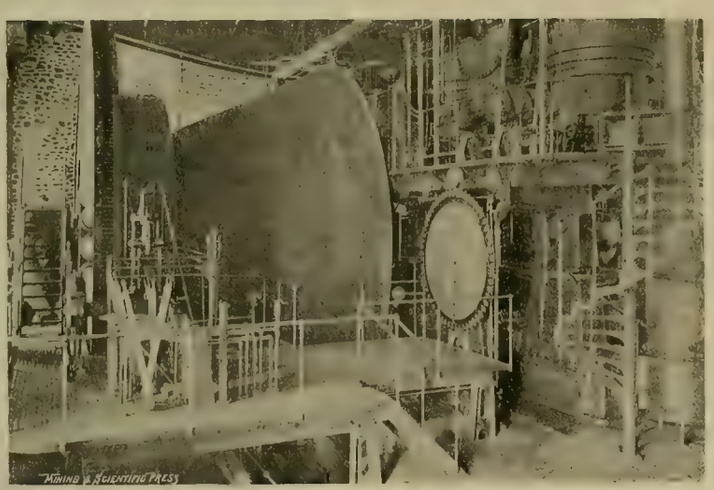
No. 1949.—VOLUME LXXV. Number 20. SAN FRANCISCO, SATURDAY, NOVEMBER 13, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

GOLD is the one commodity that has risen in value for the last ten years with marked constancy. The wages of the gold miner are the only wages that have not depreciated. California is the one commonwealth that produces annually more gold than any one of the other forty-four States. The market produced by the needs of the gold miners of California is the one demand most productive of satisfactory payment to farmers, manufacturers and merchants. The San Francisco County Miners' Association is the one city organization that sees this, that wants to develop gold mining in California, that wishes to thus advertise the State's gold resources and afford opportunities for profitable investment. This is why the MINING AND SCIENTIFIC PRESS supports the new movement. In season and out of season this paper has steadily advocated these ideas, and gladly joins with any earnest practical effort along those lines looking to public benefit.

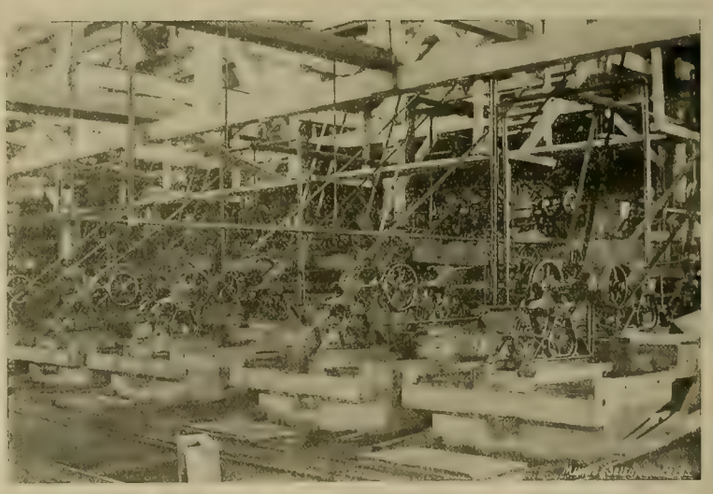
A SINGULAR FEATURE of the Klondike, unheard of elsewhere, is, that there are no surface indications of the gold underneath. The surface is moss, swamp and muck. To start a shaft the moss is first scraped off, then the miner sinks from five feet to twenty feet through muck to the gravel underneath, where he finds his first colors. He keeps on sinking through various depths of gravel down to the paystreak upon bedrock. In many places a sheet of solid blue ice that has never thawed since its first congealment overlies the deposit of gravel. When the air strikes any uncovered ground, like the walls of a shaft, the frozen mass begins to thaw, and in a short time the shafts and drifts are filled with water. This seepage during the summer is a great drawback to both mining and prospecting. The Klondike was prospected, or rather run over, a number of years before the discovery was made. The writer of the letter to this paper, printed on page 415 of the issue of the 30th ult., tramped over the Klondike placers nine years ago, and, although an old experienced placer miner, had no inkling of the millions that lay beneath.

IN relation to the gold discoveries said to have been lately made upon the slopes of Skookum gulch, near Dawson, it is to be observed that, in general, the slopes of hills, the sides and tops of long spurs, and even the tops of main ridges, under the surface skin, are sometimes covered by a certain depth of soil, boulders, gravel and clay, containing a surprising amount of gold, and, under the same conditions, large masses of quartz and loose deposits of gold-bearing rock, rich in metal, are at times discovered. The gold and rock, so found, is often in such a condition as to indicate the close proximity of the orignal source, yet, in the majority of cases, this will probably not prove to be the case. These slope deposits often appear to be created by concentration from high-lying gravels or glacial morainic matter, in the gradual formation of the country, and the gold so found may and very likely has been transported from more or less distant places. Cases are in mind where the sides and tops of long extending spurs have had the thin skin of gold-bearing material covering them carefully scraped away, every square foot of it proving rich. This gold came from the kind of concentration spoken of, and there were no gold-bearing veins anywhere in that region.

MINE TIMBERING, CALUMET & HECLA.



TRIPLE EXPANSION HOISTING ENGINE, CALUMET & HECLA.



VIEW OF STAMP MILL, CALUMET & HECLA.

(See page 458.)

CONSIDERABLE is being claimed at present for the bromine process of gold extraction, in contrast or competition with the cyanide and chlorination processes, and recent experiments in Colorado go far toward establishing the correctness of those claims so far as high percentage of extraction is concerned. But, so far, the increased expense of the process militates against its use. That calcined gold ore treated with bromine and caustic soda will give up a very high percentage of its assay value is an undoubted fact, but the present high price of bromine bars any claim to economy in the process, and it is the most economic method where suited to the ore that is in special demand. Mr. Cassell, the manager, says the process "in a majority of cases is bound to supersede all others," which, under the circumstances, is a most sanguine view.

IT is evident that many thousands will go from all parts of the country to the Yukon region early next year. There will be a large business in the way of outfitting transportation. The rush last July and August will be beaten in numbers and interest by next spring's stampede, and no amount of argument or sober statement of facts will prevent it. Already enterprising coast cities are preparing for the business of which San Francisco can easily handle considerable. Innumerable bogus stock and transportation companies are being formed in all parts of the country and the inevitable aggregate of disappointment will be unusually large.

THE Denver *Republican* makes a good point, where, in discussing foreign mining investments, it says: "There is nothing to be gained by a mere transfer of title from a local to a foreign company, in the case of a developed and producing mine, except where the purchase money is reinvested in local enterprises."

THE Witwatersrand, South Africa, district yielded 1,120,868 ounces gold in 1892; 1,478,473 in '93; 2,024,159 in '94; 2,[illegible],635 in '95; 2,281,875 in '96, and about 2,400,000 ounces for the first ten months of '97.

Amendment of Federal Mining Law; Brief Description of the Calumet & Hecla Mine, Lake Superior, Michigan, 458. Edison's Ore-Working Process, 458-9. The Yukon District; Increased Threefold; Amendment of Federal Mining Law; Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 465. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations, 466.

AT a temperature of 50° F. a cubic foot of compressed air on the surface of the earth weighs 536 gr.

AS COMPARED with twenty-five years ago, forty per cent more gold can now be extracted from the same ore at a less cost of thirty per cent.

IT is believed that the mill at the Dalmatia mine, El Dorado Co., Cal., was the first quartz mill on this coast to be run by electricity, the installation having been in Sept., '89.

THE Salt Lake, Utah, *Tribune* notices the fact that cyanide works are quietly being established in a small way in many parts of the West, and run like moonshine stills, to avoid paying royalty.

RICH ore is by no means synonymous with large profits. The character of the ore, the size of the vein, the situation of the mine, the water supply are now the chief factors in what is purely a commercial problem.

THE most noticeable difference between Idaho and Nevada mines is that in the former the percentage of gold in the ore increases with depth; in the latter, usually, the deeper the mine the greater the percentage of silver.

WHILE miners' wages in California rule as high and in some instances higher than elsewhere, there are no more $4 per day jobs, the usual price now paid being from $2.50 to $3 per day. The Comstock, Nevada, and some Butte, Montana, mines still pay $4 per day.

THE Witwatersrand district, South Africa, is a good example of what science has done for mining. That district in the last four years has produced 7,385,000 ounces gold. This production has largely been made possible by the cyanide process. The whole thing is a chemical problem, successfully solved. Another illustration is the reduction in the cost of milling quartz at the Treadwell, Alaska, mine to about one dollar per ton.

THERE is a balance to the credit of the U. S. Patent Office, in the National Treasury, amounting to $5,093,614.23, an excess of receipts over expenditures. Meanwhile the Patent Office is cramped, the accommodations inadequate, the surroundings wretchedly insufficient, and the money piles up. The work of the office is in arrears, but the National Government constantly neglects this important branch of the Government, which, though it has a faithful commissioner, is notoriously lacking in many essential elements—a chronic condition of untoward affairs that calls loudly for relief.

Monuments, Etc.

It is seriously proposed to collect and expend $100,000 in the erection of a "monument" on the intersection of two principal streets in San Francisco, to be built of various mineral productions from California counties, "to testify to California's varied mineral resources." Anything that will do that should not be discouraged, as California is proverbially modest in announcing its attractions in any line; but it is believed that this monument idea is unworthy of serious notice. It would be more practical and to the purpose to spend one-half or one-fourth of that amount in actively aiding publicity of the resources of the State. The settled policy seems to be to conceal rather than proclaim the natural riches of the Commonwealth. The railroad companies seem afraid some one will find out that we have great gold mines here, and sedulously decry any effort at publicity. In all their published literature, any reference to the mines—the chief industry of the State—is kept out. In contrast to this is the action of the Colorado railroads. They annually spend tens of thousands of dollars in issuing handsome folders, superbly illustrated, portraying the different mining sections of Colorado, and telling how they can be reached. This pays; the railroad companies certainly don't do such costly work for the fun of it. Advertising is the secret of success. A good thing always is worthy of good advertising, whether it is a State, city, mines, mining machinery, Klondike outfits, or anything else. Colorado understands this and advertises. So does Los Angeles. On a recent Sunday the *Times* of that city of 100,000 people had 134 columns of advertisements; the *Examiner* of this city of 400,000 people had 78, the *Call* 63, the *Chronicle* 53. This proposed "monument" is an advertisement or nothing. The money could be better spent in better forms of advertising.

At present about 100,000 people contemplate going to the Yukon region as soon as possible. They will spend $250 each in starting. Here is an aggregate of $25,000,000 to be spent by men whose road lies through San Francisco. 'Twould be business to take the whole or part of that proposed monument fund in sending out reliable information regarding the value of San Francisco as an outfitting point for those 100,000 men who propose to pass on to the Klondike early in '98.

Concerted effort is now making by mountain and valley residents to satisfactorily solve the problem of resumption of hydraulic mining. Appropriate expenditure of this proposed $100,000 would materially aid therein.

There are a good many ways such a sum could be expended so as to practically help the mining industries of the State, but monuments in this city are not among them. We have a good many fine mining "monuments" now. With the exception of the new Spreckels building, which is a monument to the profitable character of the sugar business, the new Spring Valley building, which illustrates the value of supplying water, the new Gas Co.'s building, which exemplifies the financial possibilities in that direction, there is not a handsome structure in San Francisco that is not a "monument" to the mining industry of the State or coast, as it was money made in mining that built them.

IT is with pleasure we note the successful completion of the narrow gauge Sierra railroad from Oakdale as far as Jamestown, Cal., and the driving of the "last spike" at the latter place with appropriate ceremonies last Wednesday. It is particularly pleasant to chronicle such success, as it was a series of editorial articles in these columns two years ago that led to the attempt that has proved successful. In one of those articles the exact route followed by this new road was indicated and the starting point (Oakdale) specifically pointed out. Such roads will do much for the mining and industrial interests of this State. As has heretofore been shown in detail, their construction in other localities is feasible and their result financially satisfactory. In this regard it is now amusing to recall that when the MINING AND SCIENTIFIC PRESS was advocating the building of this road, which is now in successful operation, it was bitterly assailed by a local journal, which now triumphantly announces "our great industrial awakening." The opposition was because of the "injury" it would be to the freighters. Such hidebound notions have no place in this new era of mining. The business of mining is now purely business. There is no moonshine nor sentiment nor romance about it. The sooner this fact is put into practical observance in other sleepy sections of the State the better for the general prosperity of the commonwealth.

A Smelting Trust.

A Denver, Colo., dispatch says: "For several days the managers of all the smelters from Texas to British Columbia have been conferring together in this city with a view to the promotion of the allied interests of mining and smelting. There appears to be a unanimous determination to devise some means, if possible, to obtain the true market price for their products, instead of the doctored and insufficient quotations now furnished by certain New York jobbers. In the case of lead, for instance, there is no good reason why the market price in New York should not be quoted daily at $4.25 instead of $3.75, and it is believed that, through concerted action on all the lead smelters, justice can soon be obtained. The same is true of silver." It has been the custom all along to have two sets of quotations, one being "exchange," on the same obsolete principle of "steamer day" in San Francisco. It is evident that some good will come of the present conference in securing a basis for quotations that will be clear and satisfactory to buyer and seller alike.

Another Denver report is to the effect that during this week a new smelter trust has been in process of formation in that city, the leading smelting plants of that State being represented and also the smelters of Utah, Montana and Washington, together with the companies recently organized for business in British Columbia, which are closely related with the industry on this side of the line. This new trust is said to have two main purposes in view. The first is to confine the chemical plants, using cyanide, chlorination or mixed processes to gold ores which average $20 and less per ton, thus diverting to the smelters all material of a higher value. This diversion of the field is expected to do away with too sharp competition. The second purpose in view is to cut down the fees of the ore samplers, who, in many of the districts, stand between the producers of ore and the smelters. The sampler affords a cash market to the miner, whether he be leaser or owner, regardless of the size of his shipment. It is, therefore, next to impossible to rule the sampler out; but, if the trust can limit its profits, more margin will be left for the smelting companies.

PRESIDENT NEFF of the California State Miners' Association has appointed a committee of thirteen, to whom is delegated the delicate duty of "urging upon the attention of the members of the U. S. Debris Commission the importance of expending the money now at their command in erecting restraining barriers in the Yuba river." It is not likely, however, that the committee, or any portion thereof, will more than mildly suggest to the Commission. While, doubtless, upon being "urged," the members of the Commission may convey to the members of the committee assurance of their distinguished consideration, it is unlikely that any manifestation of civic impatience will hasten or retard the movements of the members of that military board. The duties that devolve upon the Debris Commission are in addition to an immense amount of work that those U. S. engineers have to do in connection with general coast matters, and are necessarily secondary to the original scope of official work. It is probable that while in common with the committee the members of the Commission regret the untoward delay in the active expenditure of the half million dollars, they are obliged by daily limitations of time to devote much of their available hours to many other calls upon their official capacity. It is noted that, in addition to this committee of thirteen, a committee of three has also been appointed to confer with a similar committee from the Anti-Debris Association, with a view to further co-operative urging the matter of river improvement upon the Commission. The work is of immediate importance, of present and pressing necessity, and it is to be hoped that proper presentation of the facts will enable the Commission

to make such showing to the Administration at Washington as will result in more activity in that direction.

Mining Investments.

In considering mining investments, the investor should carefully distinguish between "mines" proper and "prospects." While this seems trite, there is no point more commonly lost sight of by those who purchase shares in the various mining ventures proposed to the public.

All mines begin as "prospects," but it does not follow that all "prospects" will develop into paying mines. Its location does not necessarily imply that a mine is valuable; being in the "well-known mining district" does not give it value, since a portion of the territory of any mining district is worthless for mining purposes. Being the "extension of the celebrated ——— mine" or located on the "same vein as the rich ——— mine" does not insure value, since the "extension" may be in the wrong direction, and "veins" are by no means equally mineralized in all portions of either their length or depth; being "adjacent to" or "alongside of" some good paying mine in effect may mean that it is worthless as far as the work done in the mine that may be cited proves anything, since it may be on the side "away from the dip of the vein."

And yet all of the instances given when properly understood, actually form a legitimate basis upon which to found an expectation of a profitable business to the owners of a piece of mining property or prospect. Veins are rarely vertical, ore seldom occurs in pay quantities equally along all portions of their length, and where chimneys do occur, they frequently do not run straight down on the vein, but incline along it, so that the work in one mine may show that two pieces of property, one on one side of it, towards which the veins dips, and another on one end of it, towards which the pay ore dips or trends, may be valuable although the owners of the adjacent ground have spent no money beyond that needed to protect or secure their titles. A "prospect" is a legitimate subject for investment: its value is of course, largely speculative, since the element of risk enters into it, under any circumstances, but that is also the case in any other investment, and is hardly more than that attending the purchase of the stock in new railway enterprises, town sites, trolley lines, building and loan associations, or even new banks, or other financial itstitutions; the element of uncertainty is perhaps greater, but on the other hand the actual ready capital called for at the start is small and returns in many cases are larger than those of any other line, and, on the average will compare favorably with any.

A "mine," that is, a piece of mineral territory, originally a prospect, which has been opened up by shafts or tunnels, various working levels, etc., is hardly a speculation at all, but is as much an investment as a house and lot in any town or city. By exposing blocks of actual ore its workings have not only created real value, but have provided the means for conveying that value from its site to the surface and thence to market. It is not only in such shape that the actual net value can be easily determined, within very narrow limits of error, for all the ore "in sight" or exposed to view, but also more certain data are attainable than in the case of prospects for estimating and determining the probabilities for the future, that is, the results to be expected from territory now unexplored, but which is to be depended on for furnishing profits when the present ore reserves have been extracted and marketed. Such properties have been put in shape by the owners by the expenditure of capital, whether money taken actually out of their pockets or yielded by the mine, and by them spent on the mine, is immaterial. In such cases the market value will certainly be high enough, and with reason, to make the annual profits a near approach to the ordinary rate of interest, assuring a safe investment with but relatively moderate returns.

ELSEWHERE in this issue appears a more detailed account of Edison's work at his New Jersey iron mines, in addition to the report of the process in the preceding issue. He certainly has "the courage of his convictions," having, so far, spent $3,000,000 of his own money to secure success. He has staked his great reputation, an immense amount of money, and his personal faith, against the advice and judgment of many experts, and, while 'tis not in mortals to command success, he certainly deserves it.

PROFESSOR CHAS. D. WALCOTT, Director of the United States Geological Survey, has returned to Washington after an absence of four months spent in the field. In the course of his journeys Mr. Walcott gave a short time to geologic investigation in the Sierras, on his own account, and to attending to the general affairs of the bureau. He was engaged principally, however, in looking after the surveys and investigations of the suspended forest reserves, a work only just entered upon by his bureau, and to start which Congress, at the last session, made an appropriation of $150,000. This work was started and got under way last July. In connection with this branch of the work, topographic and subdivision surveys are being made in nine of the forest reserves of the West, the field being divided between two of the topographic divisions or sections of the survey. Mr. R. U. Goode, of the Pacific Section, will work in the San Jacinto reserve of southern California this fall, sending some of his parties into that area when they are driven by bad weather out of the more northern reserves. Data on which to base definite statements of the results of the surveying work of the season are not yet available. Preceding the topographic work proper triangular and spirit-level lines are being run, except in the higher and more rugged regions, where there are no roads and trails. The subdivision surveys are being made in the usual manner. An additional feature is the outlining by the surveyors, in the course of their other work, of all wooded and forested areas, and another is the erection, at suitable intervals, of permanent bench marks, to mark the elevation above sea level. There are from one to three parties in each reserve. Such data as are at hand indicate that the surveys have progressed satisfactorily, considering the lateness of the start, the rugged character of much of the country traversed, etc. The topographic maps which will result from the topographic surveys will be on the scale of two miles to the inch, with 100 foot contour intervals. These will serve as base maps for the representation of forestry details, agricultural and mineral lands, etc. The subdivision surveys will enable the demarkation of tracts of land for agriculture, for minerals and for timber.

ANOTHER of the absurd administration rulings have been reversed. In apparent collusion, Hoke Smith and his man Friday, Lamoureux, some time ago ruled that lands containing petroleum are not subject to location under the mining laws. Smith was Secretary of the Interior and Lamoureux was Commissioner of the General Land Office. It was a corporation victory. The miners waited till time put a broad gauge man in power and got a rehearing with the result that the present Secretary of the Interior rules squarely opposite to his predecessor of unhappy memory and decides that petroleum is mineral, and hence the oil tract in dispute is not to be included in the railroad grant. Secretary Bliss quotes the law and cites standard authorities in support of his ruling. In effect it is that land containing deposits of petroleum is mineral land and subject to entry as such under the laws regulating the location of placer mining claims. Where such prompt attention is given to the requirements of justice the action goes far toward compensating for the absence from governmental counsels of a Secretary of Mines and Mining.

ON another page is given the outlines of a scheme for a telegraph line to the Yukon. The enterprise cannot fail to call to the minds of old residents of this coast the costly effort of a generation ago to build what was then known as the Collins telegraph line, an extension of the Western Union, being a project to connect Europe and America overland by reason of the failure of the first Atlantic cable. The Western Union secured concessions from the Russian Government—which then owned Alaska—and from the Canadian provincial authorities, divided the work into four divisions, and in the summer of 1865 started exploration and construction expeditions from San Francisco. The stock was held at fancy prices and everything pointed to success. Nearly thirty steamers and sailing vessels, accompanied by a man-of-war from the United States, Russia and England, respectively, sailed from this city. During that season considerable work was done and nearly 800 miles of line built across British Columbia into Russian territory toward the headwaters of the Yukon. St. Michaels—which is now a wintering place for stranded Dawsonites—was established in that year and the country was thoroughly explored. In August of the following year, Field and his associates successfully completed the cable across the Atlantic from New York to the Irish coast, which was the death knell of the Pacific enterprise which cost the company first and last about $3,000,000. Now the present projected line traverses for hundreds of miles the route of its ill-fated predecessor of thirty-two years ago.

THE workings of a recent Arizona statute was recently commented upon herein, the case being where the University of Arizona is required to make assays of gold and silver for fifty cents, the result, of course, being that the business of the private assayer in Arizona is not, at present, a particularly lucrative one. In answer, the author of the bill, who is the editor of the Florence, Arizona, *Tribune*, defends the measure, and says: "The law is a good one. It is in the interest of prospectors and miners, who can illy afford to pay $1.50 for such work, and, besides, fifty cents is the prevailing price in Colorado, and most of the assays from that section went to that State. Now the money is kept at home,and helps to educate the youth of the Territory." In this case, as in many others, so much depends upon the point of view.

ONE of our most valued exchanges is the Patent Office Official Gazette, a Government publication which usually is composed of about 160 pages. It has run as high as 194 pages for one issue; but the issue of October 27th, '97, exhibits a degree of business which would be the envy of a private publication. The issue in discussion contains 288 pages, the large size being due to the description of 125 patents granted to M. G. Kellogg of Chicago relating to switchboards for telephone exchanges. Though the Government printing office is able to do a tremendous amount of work in a short time, the exigency of the occasion compelled even that great concern to wire for extra type and to put on sixty extra men to complete the job.

THE tremendous advertising that the Klondike has received will start 100,000 adventurous men into that region next spring. Their wants must be supplied and the millions they will expend for transportation and supplies can as well be spent in San Francisco. Ultimately, they will drift to California anyhow, as they gradually realize that gold can be secured in this State without the hardship and risk of life attendant in northern wilds; but till that degree of knowledge is vouchsafed them, the coast can outfit them for their new quest of the golden fleece.

THERE is a difference between business methods and intent. Some "journals" send men through the mining regions soliciting mine owners for money to secure publication therein of "writeups." For close on to thirty-eighty years the MINING AND SCIENTIFIC PRESS has paid practical men to travel and report on mining properties without cost to the owners, and in this way has given world-wide publicity to the mining resources of this west half of America.

THE statement of our Shasta Co., Cal., traveling correspondent regarding the Chinese is illustrative of how difficult it is to get correct statistics of the gold yield of this State. Between Chinese who never make any reports and Caucasians who decline giving any information as to the gold output of the properties in their control, it has always been evident through the years that the reported gold yield of California has been necessarily incomplete.

THE assertion is again made with considerable positiveness that the Le Roi, B. C., mine was sold in London, this week for $5,000,000, "to the Rothschilds," as usual. Last week the Rio Tinto Co., were the reputed purchasers.

Notes on Dredging for Gold.

Written for the MINING AND SCIENTIFIC PRESS by JOHN W. GRAY.

After great effort, numerous trials, many failures, and some large losses, this system of gaining gold has been evolved from crude beginnings into a systematic and satisfactory method of mining. Dredging for gold is now attracting attention and bids fair to become an established form of mining for gold. In New Zealand, where more work of this nature has been done than elsewhere, the evolution of the industry has been the work of years. The rivers upon which dredging operations are carried on are swift-flowing streams, subject to frequent floods, having a considerable depth of gravel, with boulders, and with runs of pay dirt interstratified. The conditions are, therefore, not the best for economical and successful work, and it is not surprising that many failures have occurred. The runs of gold are, however, often extensive and rich, and operations carried on upon such reaches have in a number of cases given satisfactory results.

The improved form of dredge is a double pontoon, with ladder and chain bucket arrangement between. Screens separate the coarse from the fine material. Wide sluicing tables catch the gold, centrifugal pumps supply the water, and the waste material is handled by elevators. The power is usually steam, although electricity is used in a few instances, where conditions are favorable. The dredges vary in size and capacity, but are now built of large size and great strength. Twenty thousand dollars is the cost of a large dredge with all the latest contrivances. Under favorable conditions, material has been handled without loss that only yielded a grain of gold to the cubic yard. The real cost, in actual continued working, is believed to be very much in excess of that figure where average conditions exist.

According to the report of the Mines Department for 1896, the gold-saving appliances of the dredges operating upon the Clutha river and tributary streams were imperfect, and the work was considered remunerative only because of the richness of the ground worked. No information as to the yield of gravel or cost of work is given, and secrecy is maintained by those operating dredges regarding yield and value of gravel, cost of work, and all the details of their operation. One dredge on the Clyde side of the Shotover, working to a depth of 20 feet below water level, lifted forty tons per hour when operating. Six men were required to work day and night, and three tons of coal were consumed per day. According to the New Zealand *Mining Record*, eleven dredges during the four weeks ending July 24th, 1897, secured $29,548, working expenses being about 21 per cent of the total yield. This would give an average for the month of $2686 for each dredge. Nothing is learned regarding value of gravel, amount worked, or expense of working, save as a percentage of total yield. This is an unsatisfactory and misleading way of reporting results of operations, and gives no information that is of value to those interested in such matters. According to the Government expert of the Mines Department the dredges have, as a rule, been under the management of men with mechanical skill only. The gold, it was thought, would save itself if the dredges handled the material. Many of the failures are attributed to the fact that the men in charge were not familiar with or skilled in gold-saving operations, and it is believed this has been the prime cause of nearly all failures where the conditions for operating were favorable.

So far, in this country, with a few exceptions, dredging operations for gold have not been financially successful. From crude beginnings, however, the machines have been rapidly improved and perfected until now, in some localities, dredges believed to be the most complete yet constructed are being put in operation, and results are promised, not yet attained, in the way of economical working and high percentage of saving. During the last few years a number of dredges have been operated in California, British Columbia, Idaho, Montana and Colorado, but with poor success. Very few proved themselves capable of paying their way. Some of the machines were faulty within themselves, others were entirely unable to cope with the swift currents and large boulders of the streams upon which they were operated. This latter is said to have notably proved the case with the dredges tried upon the Fraser and Quesnelle rivers.

Dredging operations upon Grasshopper creek, near Bannack, Montana, are now carried on successfully upon a large scale. The upper Sacramento river, in this State, has a dredge doing profitable work and, in a small way, dredging is successful upon the Klamath. A dredge upon that river, composed of two flat boats with a large steel scoop between, is able to cut and hoist the gravel and soft bedrock, and to handle boulders of from four to six tons weight. The dredge is run day and night, has a 25 H. P. engine, and requires three men for each shift. In gravel 10 to 25 feet deep 400 cubic yards can be handled every twenty-four hours. Cost of dredge, $8000.

A large dredge of the chain-bucket variety is operating in northern Mexico, in a dry country, where there is little water. The actual capacities of these machines are 60, 100 and 150 yards per hour.

Perhaps the most interesting dredge yet brought to the notice of the public is one lately built by the Risdon Iron Works of San Francisco, and now operating upon the Yuba river, near Smartsville, Cal. It is of the elevator or chain-bucket type, 96 feet long, composed of two pontoons, separated by a space 5 feet in width, in which is operated the ladder carrying the buckets. One man controls the dredge, by means of a power winch with six drums. Four drums carry lines from the corners of the dredge to anchorages on shore—one a head line and one the ladder line. The machine is to dredge to a depth of 45 feet, and is said to have a gross capacity of ninety-three cubic yards per hour. The material discharges from the buckets into a revolving and perforated screen. This segregates the large material, which is then conveyed away by the tailings elevator. Water (3000 gallons per minute) is supplied to the revolving screen for washing and sluicing purposes by a centrifugal pump, and the fine stuff falls through the holes in the screen into a distributing box, from which it passes to a set of gold-saving tables, and thence to a flume. The tables are covered with cocoa matting and expanded metal. The top tumbler of bucket chain is operated by a vertical compound condensing engine indicating 35 H. P., which also operates the pump. It is claimed for the dredge that for any ground not deeper than 60 feet below water level or more than 20 feet above, and which contains boulders of not more than one ton weight, the material can be handled at from 3 to 5 cents per cubic yard. If the capacity of the machine is given without deduction for water raised, imperfect filling and general delays, and the increase in volume of the gravel when broken up in filling the buckets, the actual working capacity would be less, and from these causes and the losses from wear and tear, breakages and repairs the cost of operating would be increased. The cost of the dredge, complete, upon the river is said to have been $25,000.

In the evolution of the dredger into the elevator or chain-bucket machine, now the popular form, the various kinds of dredges were given trials. The dipper dredge is not adapted to dredging for gold, because it disturbs the gravel in the act of digging, and some of the gold is lost. With agitation of the gravel the gold soon settles, and is not recovered. It is also very difficult, if not impossible, to construct a dipper dredge that is watertight. Another objection is that the material is supplied intermittently, thus making necessary certain undesirable arrangements for supplying the material in a continuous flow to the gold-saving tables. The same objections apply with greater force to the clamshell form of dredge. It is by no means watertight, and loses most of the gold in the act of dredging and bringing up the gravel. The objections would seem not to have the same force if applied to hard cemented gravel, or to gravel with sufficient clay or other binding material, to make it consistent. It is well to remember that these forms of dredges are, in many positions, economical of operation.

The hydraulic dredge has had fair trials and proved a failure. Large stones greatly lessen the efficiency of this form of dredge, and numerous boulders hamper the pumping work. The suction force, being intense near the pipe and decreasing rapidly a short distance away, causes the sand and gravel to be carried off, leaving the gold behind. A centrifugal pump is, therefore, of little use to catch coarse gold and clear a hard, uneven bottom. Cutters do not remove the trouble, since the gravel is disturbed by the cutting and the gold is separated therefrom.

These objections would not obtain under certain conditions, and it would seem quite possible that conditions might be found existing where the suction dredge might be arranged to do good work. A dredging company is now constructing at Seattle two dredges of the suction type to operate upon the Yukon river. This would indicate that there are those who believe that deposits occur in and along that river which can be successfully worked in this way.

The chain-bucket machine, the popular form for operating under average conditions, is a combination of the following elements: An excavating apparatus which clears the bottom and handles the material with little agitation, and slowly and continuously delivers a regular quantity of gravel to the gold-saving appliances; a revoving screen to receive and wash the material, and separate the coarse from the fine; an elevator or contrivance for carrying off the coarse gravel and stones; a gold-saving arrangement or tables, over which the fine material passes and upon which the gold is caught; a pumping apparatus to supply water for washing and sluicing.

The proper capacity of a machine seems to be regulated by the capacity of the gold-saving appliances. The tables should be as wide as possible, with frequent drops, and the fine material should be distributed over the tables in a thin film. The tables are covered with plush or cocoa matting, and sufficient water supplied to keep the material clear. The material should be supplied evenly, continuously and regularly to the tables. Care and attention are required to catch the fine gold. A disregard of the foregoing results in great loss, more particularly in the fine gold. Mechanical skill is required to properly design and construct a dredge, and the care of a competent mechanic is necessary to see that the machine is kept in order and economically operated. The saving of the gold, however, is what makes dredging operations a commercial success. A man skilled in these matters should be in charge of mining operations. Dredges should be built of determined capacities, and should be designed to suit the conditions under which they are to operate. Careful examination and investigation of the ground to be worked should be made beforehand, and the surrounding conditions studied, and it goes without saying that these matters require engineering skill and experience.

The field for dredging for gold seems large. Where the proper conditions exist, it is a system which commends itself and which gives promise, in competent hands, of being an economical method of mining. There is probably a very large extent of country where dredging for gold will be carried on profitably. Ground need not be in a river, if there is seepage water sufficient to float the dredge and supply clear water for the saving of the gold. Dredging requires little water as compared with that required for sluicing and elevating, and this water can in many dry localities be supplied at small expense, where a supply for hydraulic work or elevating would cost a very large sum or be impossible at any cost. Any power suitable for driving the prime motors can be utilized to run the dredge. Indeed, it would seem as if a system of mining was about to be perfected which may make possible the profitable working of many deposits not easy to be worked by other methods, and which may, in many instances, solve problems regarding the successful working of deposits which hitherto have seemed most perplexing, and even impossible of solution. Some doubt exists as to possible economical dredging operations under the water of torrential streams. The strong currents, frequent floods and many large boulders found in the channels of such streams make the working of the machines difficult and costly. This would not be so much the case in the long stretches of less current, nor would it be so at all in the valley-like reaches in the lower portions of such streams, nor in the wide, flat portions of country where the streams enter the plains.

Although dredging for gold as a method of mining has passed the experimental stage, there is a great lack of reliable data regarding all details of operations and the actual cost of real and continued working. For this reason it would seem especially desirable that all projected enterprises, in the way of dredging work, should first receive the most careful investigation, and that afterwards all operations undertaken should be under the direction of skilled and experienced men.

New Steel Process.

Many of the failures of cast-steel apparatus are due to flaws. The drooping of big guns, the bursting of smaller ones, the fracture of engine cranks, railway wheels and propeller shafts are more often due to hidden flaws in the steel than to any other cause. This has made it a matter of moment that some plan by which the occlusion of air could be absolutely prevented. A new invention designed for this purpose has been patented by W. E. May. By this process the castings are made in an air-tight chamber from which the air is exhausted, the mold or casting being placed in the chamber before the exhaustion of the air. This chamber is surrounded by a series of other chambers, each connected with the central chamber by a pipe controlled by valves. In these chambers a reserve of vacuum is stored, the air from them being exhausted by vacuum pumps.

When a casting is ready to be run in, the controlling valves are opened and the residue of air in the casting chamber is instantaneously sucked out into the surrounding chambers, at the same moment that the molten steel is poured into the mold. The casting thus takes place in vacuo, the secluded air and gases rush out of the fluid metal and diffuse themselves in the vacuum chambers, and a flawless, homogeneous steel casting is the result. In the case of large ingots or armor plates the process provides additionally for subjecting the fluid metal to uniform compression by means of hydraulic power while in vacuo, so that cavities which might result from contraction of the metal while cooling will be rendered impossible. It is usual at present, when making large castings, to use about 40 per cent more metal than is required for the work, because the upper part of the ingot, being permeated with air and gas bubbles, has to be cut off and discarded as useless. By the May process it is claimed that this waste will be avoided.

There seems to be some diversity of opinion as to the practical value of this method of casting steel; and the process is not receiving much encouragement from steel manufacturers. This, however, was the case with the Harvey process till its merits were demonstrated.

Notes on Selenium and Tellurium.

EDWARD KELLER.*

It is not very frequently that the technical chemist and the assayer, or the metallurgist, meet with the two elements selenium and tellurium, although the assayer's work in gold assaying and treatment of the ores is often rendered more difficult by their presence. No analysis of any of the Western crude copper, however, is now complete without the joint, or separate, determination of selenium and tellurium.

It is not the object of this paper to fully describe any of the methods in use for their separation from other elements. A few new features, merely, will be pointed out.

It has long been known that many acid-forming elements are precipitated by ferric hydroxide as insoluble salts from ammoniacal solution.

To have introduced this principle into copper analysis is entirely the merit of present and former chemists of the Baltimore Copper and Smelting and Rolling Co.

The elements of this group which occur, or may occur, in copper are phosphorus, arsenic, antimony, tin, selenium and tellurium. With all these elements this method may be most successfully employed when they are present in small quantity and the precipitation of the copper becomes impracticable. When the proper conditions are observed it is most efficient, rapid and simple. From five to many hundred grammes of copper, with a comparatively very small amount of iron, are dissolved in nitric acid, enough ammonia added to hold all copper in solution, boiled, and the ferric hydroxide filtered and washed.

From this precipitate the enumerated elements can easily be separated by known methods.

The following is illustrative of the behavior of selenium and tellurium in relation to this ferric hydroxide separation method. Of each element one gramme was taken, and by oxidation with dilute nitric acid a solution of selenous and one of tellurous acid obtained. One gramme of ferrous sulphate was dissolved and oxidized, and that amount of iron added to each solution, as well as to each succeeding filtrate (previously acidified) after the ferric hydroxide, precipitated by ammonia, was collected on a filter and washed. The ferric hydroxide precipitates were each dissolved in hydrochloric acid of the proper strength, and the selenium precipitated with ferrous sulphate, the tellurium with sulphur dioxide, and determined on tared filters.

The quantitative results were as follows:

It is clear that the reaction is quantitative only when a certain excess of iron is present, which for selenium must be many times greater than for tellurium.

The method universally recommended for the separation of selenium and tellurium is the potassium cyanide method, selenium being readily soluble in a solution of that compound. Tellurium is also dissolved in small quantities, which must be again separated, and for that reason the method is unsatisfactory.

The best precipitant for both elements is declared to be sulphur dioxide.

To obtain the metallic precipitates by any reducing agents the two elements must be in solution as selenous and tellurous acids. The same is true if the sulphides are desired by precipitation with hydrogen sulphide. Selenic and telluric acids are only reduced to the lower form of strong boiling hydrochloric acid. In describing the experiments made, the solutions spoken of are always those of the former acids.

In the reaction of selenous and tellurous acids with sulphur dioxide the two show characteristic differences. When precipitated by that gas no heavy metals must be present, since they are also, at least partially, precipitated.

Example.—With ½ gramme of copper and 0.1726 gramme of selenium in solution, 0.0865 gramme of copper was thrown down.

In the following determinations, the acid of which the percentage is given is strong hydrochloric of the specific gravity 1.175. The amount of selenium and tellurium in each case is $\frac{1}{10}$ gramme. The sulphur dioxide passed through the solution until thorough saturation. Time of standing about twenty hours. The reaction was conducted in the cold.

PRECIPITATION OF SELENIUM AND TELLURIUM BY SULPHUR DIOXIDE.

	Percentage of Acidity of Solution.			
Precipitation of—	*0.5*	*1*	*2*	*3*
Selenium	.....	0	.....	trace
Tellurium	total	0 0761	0.0525	0.0653
	Percentage of Acidity of Solution.			
Precipitation of—	*5*	*8*	*10*	*0*
Selenium	0.0124	.....	0.0349	0 0935
Tellurium	0.0745	0.0931	total	total
	Percentage of Acidity of Solution.			
Precipitation of—	*30*	*40*	*50*	*60*	*65*
Selenium	total	total	total	total	total
Tellurium	total	total	total	total	0.0965
	Percentage of Acidity of Solution.			
Precipitation of—	*70*	*75*	*80*	*90*	*100*
Selenium	total	total	total	total	total
Tellurium	0.0882	0.0411	0	0	0

The accompanying graphical representation of these figures perhaps conveys a more clear idea of the difference of behavior of the two elements.

From the above facts we learn that even with sulphur dioxide in a hydrochloric solution of over 80 per cent acid a separation is possible. We also see that to obtain a total precipitation of the two elements together in this way the acidity must be confined to definite limits, safely between 30 and 50 per cent; otherwise, one or the other of the two will remain wholly or partially in solution.

If, after saturation with sulphur dioxide, of a selenous acid solution of insufficient acidity, the necessary amount of hydrochloric acid be added, the precipitation becomes total. The same is the case with tellurium in case of insufficient acidity. In case of too high acidity diluting to the required strength calls forth total precipitation.

The figures for partial precipitation are not absolutely constant. They show variations under different conditions, such as temperature and time of exposure to the action of the reducing agents.

Both elements are more voluminous when precipitated from weak acid solutions than when precipitated from stronger ones.

Ferrous sulphate does not precipitate tellurium.

A series of determinations of selenium, precipitated from solutions of various acidity by ferrous sulphate, showed that the reaction is rapid and quantitative in strong hydrochloric acid. The degree of rapidity of precipitation diminishes as the acidity is reduced. It is total within twenty-four hours as long as the acid is 30 per cent or more. In fact, the reactions of ferrous sulphate and selenous acid are almost identical with those of that acid and sulphur dioxide.

These facts furnish a simple method to separate selenium from tellurium, or any other of the ordinary elements, for analytical or industrial purposes. Gold and silver only, of the metals usually present, interfere. Gold may previously be precipitated by oxalic acid, which does not affect selenium, and silver is so readily separated as chloride that it is no obstacle. Or gold may be precipitated with the selenium and weighed together, and the latter dissolved with nitric acid, leaving the gold in weighable form. Selenium is then obtained by difference.

In attempting to make electrolytic copper determinations in copper residues (from electrolytic tanks), these were treated with strong nitric acid, the silver precipitated as chloride, and filtered. The filtrate, now being freed from gold, silver, and much antimony, was then evaporated to dryness and the residue boiled with hydrochloric acid until the nitrates were fully decomposed. The excess of acid was next neutralized with ammonia, and into the slightly acid solution was conducted hydrogen sulphide. The precipitate, after filtering and washing, was digested with a sodium sulphide solution, and after again filtering and washing redissolved in nitric acid, made ammoniacal and, for the purpose of precipitating lead and bismuth, ammonium carbonate and phosphate added, and boiled. After cooling and filtering, the ammoniacal copper solution was acidified with sulphuric acid and subjected to electrolysis. It was thought to have been freed of all deleterious elements. The precipitate of copper, however, failed to come down bright and thoroughly adhesive, and on solution with somewhat diluted nitric acid a reddish residue would be visible on the cathode. This proved to be selenium.

The selenium in the same residue was then separated, and it was found by a number of quantitative determinations that by precipitation with hydrogen sulphide, and subsequent treatment with sodium sulphide, from two-thirds to seven-eighths of the selenium was retained by the insoluble sulphides of copper, bismuth and lead, the remainder being in the sodium sulphide solution, the latter always containing all of the tellurium.

Looking over many text books and considerable original literature, I found only one allusion to this fact. William Crookes, in his "Select Methods in Chemical Analysis," p. 426, 1894, says: "Selenium cannot be separated from metals with which it is combined when the sulphides of these metals are insoluble in ammonium sulphide, by making use of the solubility of selenium in this reagent. The insoluble metallic sulphide is almost always mixed with selenide."

Here it should be remembered that the precipitation of selenium, as selenium sulphide, SeS_2, from a solution of selenous acid with hydrogen sulphide, should be conducted in the cold. The precipitate has then a lemon-yellow color and is very readily dissolved by the alkaline sulphide solutions. On heating, this yellow precipitate darkens to an orange color and becomes insoluble. This is said to be due to decomposition and the insolubility of selenium.

Ditte tells us that when selenium and sulphur combine in the above-mentioned manner heat is absorbed, or the heat of formation is negative. This sulphide, like hydrogen iodide, belongs, therefore, to a class of compounds which readily decompose.

After a number of quantitative tests, demonstrating that copper, bismuth and lead separately retain selenium to a greater or less extent, according to conditions, the quantitative determinations shown in Table A were made.

TABLE A.

Element	Quantity taken	Number of precipitations. 1.	2.	3.	4.	5.	6.	7.	8.	9.	10.	Quantity found.
	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.	Gramme.
Se	1	0 0892	0 0673	0 1546	0.1297	0.2219	0.1416	0.1236	0 0513	0.0121	0	0 0213
Te	1	0.9548	0 0448	0								0.9996

The quantity of selenium in each case was about two grammes. This and the varying quantities of copper were in hydrochloric acid solution, with just enough free acid to prevent any precipitation of copper selenite. The precipitation with hydrogen sulphide was conducted under cooling, and the resulting precipitate washed with cold water, digested with a strong solution of sodium sulphide, then washed with water containing a few drops of the same reagent, then with water to which a little ammonium sulphide was added, and finally with strong alcohol. Sulphur, selenium and copper were then determined in the precipitate. The results are given in the table below:

	I.	*II.*	*III.*	*IV.*
	Gramme.	*Gramme.*	*Gramme.*	*Gramme.*
Sulphur	0.3787	0.1649	0.1730	0.0416
Selenium	0.2828	0.1726	0.1565	0.0239
Copper	0.9880	0.4880	0.4909	0.0979

Figuring the theoretical amount of copper, as combined with the sulphur and selenium found, we obtain:

	I.	*II.*	*III.*	*IV.*
	Gramme.	*Gramme.*	*Gramme.*	*Gramme.*
Cu combined with S	0.7503	0 3267	0.3428	0.0824
Cu " " Se	0.2263	0.1385	0.1256	0.0192
Total	0.9766	0.4652	0.4684	0.1016

In another experiment selenium and copper were subjected to the action of hydrogen sulphide in ammoniacal solution, and the precipitate treated as those previously described. The results obtained were:

	Gramme.
Sulphur	0.0098
Selenium	0.0138
Copper	0.0231
Copper (theoretical)	*Gramme.*
Combined with sulphur	0.0163
" " selenium	0.0111
Total	0.0274

The initial amount of copper in this last case was 0.05 gramme, and, as was expected, a large portion remained in the ammonium sulphide solution.

While the results do not appear very satisfactory from the standpoint of analytical accuracy, it should be stated that the purpose of the determinations was to find the existence or non-existence of a definite reaction, and the molecular proportions of the sulphide and selenide formed. At first sight the results might be considered of a negative character. On closer observation, however, two out of the first four determinations show a maximum of selenide, or a minimum of sulphide formation, in which the atomic ratio of selenium and sulphur is approximately 1 : 2, or the same as in selenium sulphide, as formed by the reaction of selenous acid and hydrogen sulphide.

$$SeO_2+2H_2S=SeS_2+2H_2O.$$

By the precipitation in ammoniacal solution the contents of selenium in the precipitate are higher. It is quite likely, however, that in this case more of the copper sulphide than of the selenide was held in solution by the ammonium sulphide, and it is clear that in acid, as well as in alkaline, solution only a certain maximum quantity of copper selenide is formed which never equals the amount (molecularly) of copper sulphide.

According to the above it may plausibly be supposed that the reaction takes place in two stages:

I. $SeO_2+2H_2S=SeS_2+2H_2O.$

II. $3CuCl_2+SeS_2+3H_2S=2CuS+CuSe+6HCl+3S.$

For this theory there is no positive proof; but it is plain that the hydrogen sulphide must reduce both copper chloride and selenous acid, that copper and selenium may combine in their nascent state, and that sulphur is precipitated, or that copper may combine with previously formed selenium sulphide, and that this also must be accompanied by sulphur precipitation.

The reaction appears one of the most interesting in inorganic chemistry, and deserves further investigation.

DR. BELL, of the Canadian Geological Survey, has discovered that Baffingland is the third largest island in the world; that it contains vast herds of reindeer; that it is a land of great lakes and also of great riches. What is now found to be one great island, to which this name has been given, was formerly thought to be divided by channels or sounds into several islands. It is by far the largest island in the Dominion and is only inferior in extent to Australia and Greenland. It lies northwest and southeast, and is 1100 miles in length, and may become valuable for fisheries and mines.

Edison's Ore-Working Process.

A brief description of the Edison magnetic iron works on the summit of Iron Mountain, Sussex Co., N. J., appeared on page 432 of last week's issue. The Eastern papers are full of the scheme, and if half what is claimed for the enterprise proves true Edison will save the Atlantic slope from the tremendous losses that would follow the migration of the iron industry to the great iron and steel centers west of the Alleghanies. That migration began years ago and had progressed to the point of closing many eastern plants before Edison discovered the enormous deposits of low-grade iron ore in New Jersey and set about devising a cheap process of separating the metal from its bed of useless rock. Now the iron and steel industries of the East feel that they have been saved from annihilation. They may not be able to compete with the Lake Superior ores, which are torn from the ground with steam shovels and loaded directly upon the railroad cars, but it may be possible to keep the western products from taking the home market away from the old mills along the Atlantic seaboard.

The system is simple. The iron-bearing rocks are ground to fine sand in immense crushers. The sand is dropped in a stream near a magnet. The iron is deflected far enough to fall in a special receptacle, while the sand drops down and lands in the waste heap. The fine particles of iron are compressed and baked into bricquettes and poured into a rattling stream into flat cars which carry them to the iron mills. Seventy-five carloads of pure iron are torn out of the rocks daily by Mr. Edison's great plant in the wilderness of New Jersey. It competes successfully with the iron from mines where these processes of separation are not required. And there is enough of it in the 16,000 acres of land around the town of Edison to supply the whole United States for seventy years. It is predicted that in a short time these immense beds of ore lying near the Atlantic will not only supply the iron used in the Eastern States, but will be sent abroad to keep the industries of Great Britain from stagnation. The possibilities of the work are so vast that it is not surprising that the inventor has left for a time his work of doing startling things with electrical novelties to work out this industrial revolution. It may be that his name may be remembered longer in connection with the iron industry than in the field in which he had before gained so much fame.

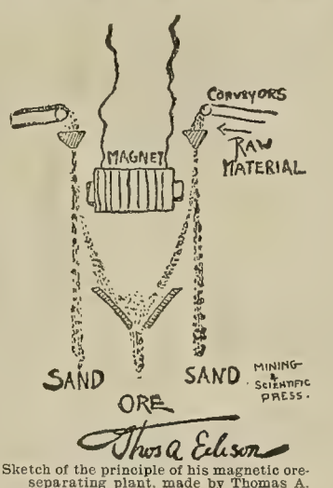
In reading the descriptions sent to the MINING AND SCIENTIFIC PRESS the first thought is that the stated amount of work must necessarily tear any machinery to pieces. Edison says he has gone into the matter of repairs and renewals thoroughly, and calculates that $14,000 per annum is a liberal allowance therefor.

Sixteen years ago Edison was walking along the seashore on Long Island, when he noticed a pile of black sand piled up on the beach. With the zeal of the scientific investigator, he carried some of it home to his laboratory, procured an electro-magnet, held it near the mass, and immediately little dark grains separated themselves from the heap and scurried across like so many black ants to the spot over which the magnet was held. The little ants were really grains of iron ore. This sand covered the shore in spots for fifteen miles along the coast, just as the black sand is found in bunches all along the California coast from the Oregon line down to a point south of San Francisco. Unlike our California beach sand, there was no gold in it. This Atlantic coast black sand was due to the erosion of Connecticut rocks by water—for magnetite is one of the constituents of the primal rocks found in Connecticut. Edison calculated that the deposits must contain millions of tons of iron which, if it could be smelted, would become a valuable product. On the basis of his find he evolved his famous magnetic ore separating machine, which he exhibited at the last Paris exposition. Then he let out the privilege of using it to a contractor, who set up a plant on the beach and proceeded to separate the iron ore from the sand, with every prospect of developing an extensive industry. But the sea proved to be less generous than it had at first promised to be, for one dark night there came a storm such as had not visited the place for many years, and when the contractor came to visit his plant the next morning not a vestige of the black sand remained. It had all been swept into the sea from whence it came, a parallel case to that of the beach sand gold mines at Port Orford, Curry Co., Or., and on the Humboldt Co., Cal., coast. When the condition of affairs in the iron trade was brought to Mr. Edison's attention, eight years ago, he thought of the ill-fated Long Island enterprise, and of his discarded magnetic separator, and wondered if it might not in the end present a true solution of the difficulty. In order to assure himself of the exact condition of the iron mines in the East, he made a tour of the mines in New Jersey, for the purpose of seeing how much ore there was left in them and how long it would last. It was on this trip that he made the discovery that most of the rocks of New Jersey were underlaid with immense deposits of iron. He invented a magnetic needle which would dip towards the earth whenever it was brought over a large deposit of iron ore. He was driving along in a buggy one day between two mines. The needle was on his lap and his mind was drifting away from the subject in hand, when suddenly he noticed the point of the needle dip violently towards the earth, and remain pointing downward. He wondered how this could be, for, as far as he knew, there was no iron ore anywhere near him. He tested the needle and found it all right. He was driving over gneiss rock at the time, and he noticed that whenever he was above this rock the needle continued to point towards the earth. His amazement became great, for, if the needle did not err, it simply meant that the ground under him was underlaid with immense deposits of iron. Determining to find out if this was so, he set a corps of men at work making a magnetic survey of the rocks of New Jersey. As a result of this survey it was found that iron ore, in a finely divided state, existed in nearly all of the older rocks of New Jersey. He then planned a magnetic survey of the whole East, and it remains probably the most comprehensive undertaking of its kind ever accomplished.

With his magnetic needle, or as he calls it, his "magnetic eye," he tested every large body of gneiss rock extending along the eastern coast of the United States, from lower Canada to the Smoky mountains of North Carolina. He found immense deposits of iron. For instance, in the 3000 acres immediately surrounding the village of Edison there are over 200,000,000 tons of low-grade ore. In the entire district there are 16,000 acres in which the deposit is proportionately as large. The world's annual output of iron ore does not, at the present time, reach 60,000,000 tons; so that in the two miles surrounding the village of Edison he calculates there is enough iron ore in the rocks to keep the whole world supplied for one year, or the United States for three years, even with the natural increase in demand. Sixteen thousand acres, or twenty-five square miles, of land contain enough iron ore to keep the whole world supplied for seventeen years, allowing, of course, for all natural increase of demand, due to the needs of a growing population. These acres would more than supply the United States with iron, including necessary exports, for the next seventy years; and they contain more than has been mined heretofore in this country since its discovery.

This was a remarkable condition—smelting works shutting down for want of iron ore at low prices when billions of tons of it lay idle in a strip of land which in most cases was within seventy-five miles of the great iron mills of the Atlantic coast. Here was an opportunity of which the inventor immediately took advantage. He set to work to plan out a great industry. It has taken him eight years to do it, but the result has justified all the trouble and money which he has expended upon it. Engineers used to large enterprises of the kind have smiled incredulously. Some of them have spoken of it as Edison's hobby and others as his folly. Some have shown him on paper that no machine could be constructed powerful enough to crush five, six and seven-ton rocks, or if such a machine were constructed it would never stand the jar and strain exerted upon it. This particular difficulty, it may be said, Edison claims to have surmounted so completely that less than 100-horse power is required to reduce rocks weighing six and seven tons to dust in three seconds from the time they are thrown into the crushing machine.

Yet, after all, he has accomplished a very simple thing. He is crushing rocks and dropping the resulting powder past powerful electro-magnets. The sand is not attracted by the magnetism, and passed straight on; the iron ore is attracted to one side and falls in a heap of its own, as shown in the accompanying sketch from the pen of Mr. Edison. This is



Sketch of the principle of his magnetic ore-separating plant, made by Thomas A. Edison.

the whole principle, yet in the actual working out, it becomes one of the most tremendous processes in the world. It is, after all, no small matter to crush the very vitals out of a mountain and then extract all of the ore from the millions of tons of sand.

The village of Edison stands on the summit of Mount Musconetcong, in northern New Jersey, 1200 feet above the sea, in the center of a wilderness. On all sides are the roar and whistle of machinery, the roar of conveyors, general noise and bustle. The workmen look like millers, so coated do their clothing become with the flying white particles, and everyone wears a patent muzzle.

Big wheels revolve in the engine house and big dynamos transmit heavy currents through overhead wires to the various points of the plant. Little narrow-gauge locomotives move about. A line of freight cars runs through the place. To the right of the village lumbermen are cutting down trees and making the land ready for the steam shovel, which is tearing away at the rocks half a mile distant. Further over, on a half-cleared section of land, a great stream of water rushes through a hose with mighty force from a hydraulic pump and washes the debris free from the rocks, somewhat after the fashion of a monitor in our California foothills. Steam drills rattle and the boom of dynamite resounds when the rock is riven into boulders and laid on five-tons skips or trays, to be transmitted to the crushing plant. The steam shovel does the work of loading, and as it has a capacity of lifting ten tons of free rock a minute, the local activity is tremendous. Flat cars carrying two skips each move along at lively speed. A long line of them is constantly leading up to the crushing point, where big electric cranes rid them of their load, and a little switching engine pushes them around a loup and allows them to run down an incline into the cut again.

Edison says: "We are making a Yosemite of our own here. We will soon have one of the biggest artificial canyons in the world." This remark is occasioned by the fact that the steam shovel is working three-quarters of a mile from the works proper. It is somewhat down the hillside, but it is eating its way on a level straight into the hill.

"It will take us a year to reach the hills, but when we do get that far in we will have a trench with walls 100 feet deep. I suppose we will take out over 600,000 tons of rock before we get there. Then, when the trench is completed, we can blast off the walls with dynamite, taking off 32,000 tons at a time."

The ore-bearing rock is blasted into boulders, laid on flat cars with a steam shovel and conveyed to the crushing plant. The cars are run in under each end of the crushing mill. The trays containing the rock are lifted by the cranes to the second story of the mill, where the rock is dumped into a large square pit.

Ten feet below is the crushing apparatus of two rollers, six feet in diameter and five in width. The rounded surfaces are studded with great teeth; the rolls run within eighteen inches of each other. These revolve with a surface speed of a mile a minute and weigh 237,000 pounds. Beneath them is another set of rollers, nearer together, with a serrated surface. These rolls will receive and grind up five and six ton rocks as fast as they can be unloaded from the skips. A skip load of rock every forty-five seconds was the ratio at which the plant was operated for the purpose of testing the capacity of the rolls, but an average of 300 tons an hour is considered a fair running capacity.

The great Corliss engine which operates the rolls takes no direct part in the crushing process. It is the momentum of the seventy tons of metal contained in the moving parts of the rolls which does the crushing. The engine supplies just power enough to run the rolls at a very high speed. If anything drops in between the rolls so as in any way to impede their progress, a clutch by which the rolls are connected to the engine allows the latter to let go its hold. After the momentum of the rolls does its work, the engine immediately catches hold again. Only the fastest train travels with the velocity of these rolls, and it is seventy tons of metal against five or six tons of rock. Again, the rock is dropped over ten feet before it strikes the rolls, and the impact on the rapidly moving rolls is often enough to break the boulder in two. From the large rolls the rock is mechanically conveyed to one set after another until the last turns it out in dust. The friction of ordinary crushing rolls at the high efficiency and pressure necessary for this work amounts, under ordinary conditions, to about 80 per cent of the horse power applied, leaving only 20 per cent to do the actual work on the rock. On the three high rolls invented by Edison the friction is only 10 per cent, leaving 80 per cent of the energy applied for the work of crushing. The principle involved means the beginning of a new era in crushing machinery. This principle can be applied in every industry where crushing is a feature—from gold extracting to sugar refining.

One of the features of the place is the great number of endless chain elevators which connect the buildings with one another. As the ore passes through each building, it is carried on to the next, automatically, in these endless elevators. After it leaves the crushing plant it is carried to the top of the magnet house and dumped through many sieves of varying meshes and past many magnet faces of varying strength before it ultimately falls in the cellar of the building and into another elevator, which carries the greatly changed product to the next department. There is over a mile of magnet faces in

the magnet house. The ore drops down through long chutes. On the way down, it passes the magnet faces. Directly under each magnet face is a side chute leading off in a direction of its own, and directly above each magnet face is a sieve. As the ore comes down, if fine enough to pass through the sieve, it continues its course; if not, it rolls off the sieve into a chute, at the bottom of which there is a conveyor which carries it back to the rolls to be re-crushed. If the product goes through the sieve, the magnet draws the ore from the sand, the sand passing straight down to an elevator, which carries it out of the building and dumps it onto a huge sand pile, which is not a useless accumulation; it is sold for various purposes to builders and manufacturers, who seek it more eagerly than they do the sand of the seashore or of the bank. Seashore or bank sand has, in the course of centuries, lost its edges, because the particles have constantly rubbed against one another. Broken rock sand, however, is very sharp, and for cement and lime-work is very desirable.

The pure ore is now allowed to drop downward and pass through a room where blowers rid it of any dust which may have accompanied it on its travel. After leaving the blower room it is a stream of pure, finely divided iron ore, which drops into conveyors and is carried to a storehouse, which holds 5000 tons. Here it may rest temporarily or it may pass on by means of other conveyors to the mixing house. It cannot be smelted in the form of iron dust. The force of the blast would blow it from the furnaces. It must be made into briquettes, and to do this it must be mixed with some adhesive substance which will prevent it from disintegrating when brought under the action of the furnace. The mixing machines are huge cylinders in which operate great iron paddles. The ore is fed into the cylinder from the top, the adhesive material drops from above, and the whole mass is churned together until every particle of the ore has come in contact with a due proportion of the adhesive substance. It becomes a sticky mass, which is pushed out of one end of the cylinder and conveyed away to the bricking house to be made into little briquettes.

The ore drops into a small orifice in the cylinder. The cylinder then turns so that the hole comes forward and exerts thousands of pounds pressure on the ore; the cylinder then turns downward and the newly made briquette drops out from the hole and falls into another endless conveyor, and is carried forward into a large oven, to be baked. There are thirty bricking machines and fifteen ovens in the plant, and a continual stream of briquettes are circulated through the hot air chambers of these ovens. The conveyors travel five times around the interior of the oven before the briquettes reappear. When they come out they have undergone a change which makes them a commercial product. For instance, they will now absorb gases in the furnace, which they are required to do; but they will not absorb water. This condition is necessary so that they may be shipped to the furnaces in open cars. If a stream of water were allowed to flow on a brick the water would simply run off; on the other hand, if alcohol were dropped on it, it would instantly be absorbed by the brick.

From the oven the bricks are conveyed to the railroad, where long trains of freight cars await them. The conveyor at this point extends out over the track, and the engineer of a train has simply to back his cars underneath the mouth of the conveyor. The bricks drop out and the cars load themselves. From the time the ore is blasted with its native rock out of the mountain side until it is loaded in the form of commercially pure iron briquettes on the cars it is not touched by human hands. The never ending and never resting stream of material constantly circulates through the various buildings, crushed by the stored momentum of gigantic rolls; hoisted skyward by steam; pulled earthward by gravity; deflected by magnetism; dried, sifted, weighed, gauged, conveyed; changed from rock into dust, and from dust into comprehensive lumps, mixed with a due proportion of adhesive material; churned, baked, counted and sent flying to the furnaces by fast freight; and not once in its course is it arrested or jogged onward by human agency.

Only 145 attendants are required to operate the plant, and these men are after all merely watchers, to see that the machinery does not get out of order. Edison says that the crushing capacity of the plant is more than 20 per cent greater than the combined crushing capacity of all the stamp mills of California. The long mile of magnet faces have enough pulling power to tear a modern cannon from its stanchions, and the great steam shovel can clean out more rock from the mountain side in a given time than any other like piece of mechanism in the world. Yet all these great affairs seem as nothing to the masterful control of the man who planned it all. Edison moves about among his men with not the slightest consciousness of having done anything great. He says it will be but a question of time when the little plant on the hill top will be the center of the great iron industry of the East. The pockets of ore from which the United States has drawn its chief supply are rapidly becoming exhausted. There is, it must be understood, plenty of iron ore in the country, but it is not the kind of ore from which steel can be made. Steel can only be made from ores in which the per cent of phosphorus is very small. Edison, with his crushing process, has entirely eliminated the phosphorus element from the ore. It therefore remains inevitable that this must ultimately become the only serious method of producing ores from which steel will be made. It would seem from the prospect that Edison will become the head of a vast industry, as great as that brought into existence by the invention of the incande scent light, and in a measure more imposing, as it embraces the production of what in commercial circ les is after all the most valuable metal on earth.

Brief Description of the Calumet & Hecla Mine, Lake Superior, Michigan.

Written for the MINING AND SCIENTIFIC PRESS by E. MCCORMICK.

Mining on a large scale and most instructive in every respect has been carried out by the Calumet & Hecla Mining Co., with the best of professional advice and the experience of thirty years. The administration of its affairs has produced such good results that its stockholders are not very inquisitive as to the details of it, for they know its officers are keenly alive to every improvement elsewhere effecting their own work, and are ever seeking to accomplish better results by incorporating in their workings whatever is proved to be good.

The population of Calumet and its suburbs is in the neighborhood of 20,000, of which number about 4500 are employed by the Calumet & Hecla Mining Co. During the thirty years the mine has been running the stockholders have received $44,800,000 in dividends, and the company has erected one of the greatest, if not the greatest, mining plant in the country.

During 1895, alone, the mine produced 77,337,922 pounds of refined copper.

The surface plant of the mine is very extensive, their being at least fifty steam engines doing service ranging from 4700 H. P. down, and of mine buildings, such as shafts, engine, carpenter, blacksmith, machine shops, etc., there are at least forty.

In the line of hoisting machinery, there is the finest here to be seen in the world, one of which is shown on the first page of this issue, and named Graliot, Houghton and Seneca. It is of the triple-expansion type, with cylinders 18, 27⅜ and 48 by 90-inch, and fitted with conical hoisting drums of 14 and 26-foot end diameters, having 8 ft. 3 in. face and a rope capacity of 5500 feet. The horse-power of each is 2000. This plant is said to have cost $750,000.

The other engines worthy of mention are:

NAME.	Kind.	Cylinders.	H. P.
Superior	Compnd.	70 by 72	4700
Rockland	Corliss.	30 by 48	600
Baraga	Deavitt.	40 by 60	2000
Frontenac	Compound.	48 by 72	2000
Lasalle	Corliss.	30 by 72	900
Perot	Corliss.	30 by 48	600
Hancock & Pewabic	Triple Expansion.	20⅛, 31¾ and 50 by 48	4000

The compressor plant consists of:

1 pair Rand, size 30 by 48, capacity 26 drills.
1 " " " 36 by 60, " 41 "
1 " " " 24 by 48, " 31 "
2 " Water Plunger, size 42x60, capacity 72 drills.

The vein is known as the Calumet & Hecla conglomerate—that is, it is made up of water-worn pebbles, boulders, bunches of sand, etc., having a length of 4200 feet, with a trend N. 33° E., dipping into the ground toward the N.W. at an angle of 37½°, and averaging in thickness 12 feet. In some places it carries epidote, this being an indication of rich ground. The copper occurs in endless forms, and is designated under three heads: stamp, barrel and mass.

This company started its shafts, of which they have twelve, from the surface in the outcrop, and have continued down in it, keeping in the lode. They vary in depth from 2500 to 5000 feet, it having been found that the increase in depth makes no difference in the character of the ore. The shafts (with the exception of the Red Jacket, or new vertical, which does not enter into this description), are sunk in the footwall of the vein as near as can be, and have as a covering blue trap containing serpentine.

Since the introduction of power drills and high explosives, the methods of mining have necessarily altered and the facilities for breaking ground have very greatly increased; but, nevertheless, the rock undergoes an enormous amount of handling. It has to be broken, trammed, hoisted, crushed, transported to the mill, stamped, and the resulting concentrates dressed, shipped to smelters, smelted, and the refined copper shipped to market. According to statistics for '92, the total expenditure per ton of rock treated was $6.62.

The general method of opening consists in sinking a shaft, drifting and stoping in opposite directions and raising or uplifting in such a manner as to form the other shafts, leaving pillars for their protection.

The method of mining is to drive a drift along the footwall as far as they intend to tram the ore to a particular shaft, this being followed by the cutting-out stage, which is merely an enlargement of the stope to its full size, and is commenced at the farthest end of the territory and worked towards the shaft, as high on the vein as it will stand without timbering. A raise is then run up the center of this block and the ground removed from both ends. The timber used for most of the distance between levels is composed of a battery of three sticks 12 by 12 inches known as drift stulls, and to these the sets are framed; two-thirds of the distance up these sets are discontinued and heavy timbers used instead, all being coated with zinc chloride and whitewashed, to prevent any possible danger of fire.

Upon reaching the surface, the ore begins to undergo the first step of the dressing process. It is dumped upon cast iron gratings raised slightly from the horizontal. All material passing through goes directly to the underlying ore bins, while that which is too large to pass through is drawn out on the floor and thrown into a large breaker 24x36 inches, which feeds to two smaller ones, 17x24 inches, beneath. Pieces too large for the breakers are broken under a drop-hammer and passed through the breakers. From the bins the ore passes through chutes into cars holding about five tons each and taken in trains of sixty to eighty cars to the mill at Lake Linden, a distance of five miles, by a locomotive weighing nearly 100 tons; eight such trips are made per day the year round, with the exception of Sundays and legal holidays. At the mills the cars are dumped into bins located in the upper part of the mill; from here the ore discharges into a shaking tray, the lip of which is above the mortar of the stamp. As the ore passes through the screens, it is collected by a splash-box and drops into a launder leading to the separators. Near the bottom and at the front of each separator are four small pipes discharging upon the screens of four jigs just opposite. In the axis of the separator and opposite each outlet is a vertical pipe, supplied with water from above and opening downward 2 inches from the bottom. Between these pipes lies a bed of copper, deposited when working and allowed to remain. As the ore enters the separator it passes over these beds, coming in contact with the rising currents generated by the pipes mentioned. The head of water in each pipe is less, to enable the heavy particles of copper and gangue to spread themselves upon the jigs. The ore that passes the fourth division is classified as slime and is sent to the settling tank. Following each separator are the roughing jigs, having two screens; the overflow from these is passed to twelve finishing jigs placed lower down, all doing different work. From the mills the copper, which is now known as mineral and contains from 65 to 82% pure metal, is sent to the smelters to undergo a chemical purification, and the method of procedure can be tabulated in the diagram herewith.

METHOD OF PROCEDURE IN THE CALUMET & HECLA MILLS.

Mechanical Progress.

Importance of the Boiler.

It is too frequently the case that the engine is looked after sharply and trimmed and plumed as though it was the only part of the steam plant that needed attention, while the boiler plant is left to care for itself. One may derive satisfaction from an engine that works quietly and feel he is getting the most out of it, and those in charge are generally powerless to obtain a higher standard because mistakes in construction cannot be afterwards modified. Too often the engine may be said to have the defects of its qualities, and though one may know the faults he is not in the position to remedy them. Great fascination is experienced, however, in endeavoring to find out errors of omission and commission, and the fewer there are the greater is the credit to the maker. As a long period is required for some of these errors to develop themselves, watchful care goes on continually. The engine favors this solicitude, as it is in the nature of an exact science in almost every part. If one is not sure of making up for deficiencies he can put his finger on the weak spots, and that sufficiently or accurately enough to leave no doubt as to their locality. He can trace the steam as it leaves the boiler and account for it in its passage through the pipes, valves, cylinders and so on to the condenser.

The effects of excessive lengths and sizes of connections from boiler to engine, undue clearance the correct setting of valves, due proportioning of cylinders and receivers, are all well known and understood. A capable engineer therefore finds that his interest increases with the lessons every day brings forth. The motion itself is the cause of many of the demands upon him from the wear and tear produced thereby, adjustments have continually to be made to keep even an engine that runs well up to its proper standard, and if from any ill design attention is constantly required then very little opportunity is left for outside matters. These remarks generally apply where any high-class installation is fitted, whatever it be, for electric lighting, mill work, marine, pumping or similar work, if the machine is to be kept running for long stretches at a time, and give the best torsional effect with least expenditure of steam.

Hence it can be well understood why the boiler often suffers for want of recognition. The conditions ruling with it are quite different. It cannot be set down in place just as it leaves the factory, fully ready for work, as the engines can. There are its brick work casings and chimney to be put up, and these very often have a great deal to do with the economical question. The engine only requires erecting just as it was in the shop, but the boiler must be complete with its settings before it can be steamed, and this is where some of the otherwise good qualities of the generating apparatus may be nullified. The course of the flues, or the distance of the chimney from them may not be correct so that the height of the chimney does not have its full effect on the draft.

The brickwork may not be of a character to prevent leakages and keep the boiler what it should be—a good reservoir of heat, ready for all demands of the engine upon it. On the other hand, when once started there are no risks of break down. There are no parts which, by reason of their motion, have a tendency to get out of order or come to a sudden stop. Thus the steady-going servant is left pretty much to take care of itself, and mountings have to be of a kind requiring no attention of any sort, or they will certainly get into disuse. In a word, they must be automatic in their action or duplicated. Valves are arranged so that if one should stick, there is a second one on which to rely, gauge glasses to avoid giving false indications, fusible plugs for emergencies in case of low water. These and other contrivances are made to meet every possible contingency from want of oversight, and that such few accidents happen proves that they come up to expectations.

Taking a boiler plant as a whole, unlike the engine as it is in every respect, details of improvement may be applied at any time. The engine is constructed, and no fault in principle admits of amelioration afterwards. One can but attend to trifles, but with the boiler, though the structure itself cannot be modified much, he finds that there are several fittings which may be applied both to the boiler and to the flues, at any period; therefore, though an engineer must of necessity never leave his engine, it is much more likely to repay him to give what spare time he has to the source of his power. Varying according to the class of engine, there should be an efficient water heater fixed, and no impurity admitted thereto. If the form of the boiler is any way detrimental, aids to circulation are required, so that there is no stagnant water anywhere. Dry steam is such a desideratum that any good means for its provision is always sure to be of advantage.

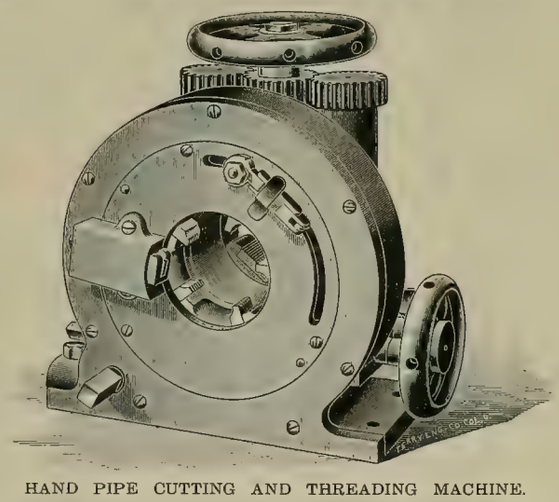
Prominence has been given in recent years to heating the air before it reaches the fire, and to exhausting to a minimum what remains is the gasses from the flues. There is certain prejudice against mechanical firing and grate fittings, but there can be no question as to the economical results obtained from them, and that is why this class of apparatus has made its way in recent years. The same is the case as regards forced draft for getting large powers in emergency or burning inferior coal. The whole subject of economical firing and smoke consumption is but imperfectly understood, but if instead of the old standard of coal in terms of water evaporated, the cost of the steam were taken in money value, then the interest on the relative prices of the different apparatus would recive their proper measure. What may be very good when tested on coal saving alone, would not come out always so well if the amount paid for it, and any after repairs, were strictly considered. Again, if great care is not taken, the adoption of an otherwise important improvement may lessen the advantage of something equally good already in use before. There is no settled consensus of opinion possible on this matter, because no two sets of conditions are alike. Not only do the different types of boilers require to be looked at from different standpoints, but even two exactly similar ones may be perfectly at variance in their steaming powers by reason of the surroundings with which each is erected in place.

A boiler maker can well plead that his responsibility finishes with test on delivery, but this can never be so with the engine maker, and it is customary to retain a portion of the purchase money for a time to insure due performance of the contract entered into. This is not too much to ask, because though an engine may appear in every respect satisfactory in the shop, when it comes to steady daily running, if there are any flaws in manufacture they are certain to be discovered. With the boiler itself, however, the double water pressure to which it is subjected represents sufficiently all the strains it will have to undergo under steam.

To what extent the difference in the conditions pertaining to the two component parts of a steam plant may have had to do with the general separation of the trades from each other it is not the present province to enter upon, but where an engine maker formerly produced his own boilers he now finds it more profitable to buy from regular factories turning out only the one class of work. There is no risk run, because boilers seldom fail to come up to the standard expected from them, but where the engineer can rest satisfied in purchasing a boiler it would not be possible for a boiler maker to do the same with an engine. The latter, therefore, starts in life with an importance that is denied to its fellow, and this continues throughout its existence. The boiler should not be despised because it does not start with the lead, but rather that it admits of improvements after location that are well worthy the attention of all engineers in charge who have economy in view.

Portable Hand Pipe Cutting and Threading Machine.

The accompanying illustration represents a portable hand pipe cutting and threading machine. In operation, the pipe is held stationary, the die head traversing the space to be threaded. The chasers have cam movement controlled by knee joint lever, adjustably secured to size graduation, by which the chasers are instantly opened and positively closed. Five chasers are used to a set which insures truer threads than sets of less number, they are readily interchangeable and can be resharpened by grinding.



HAND PIPE CUTTING AND THREADING MACHINE.

Nothing Impossible to the Inventor.

All obstacles seem to fade away before the versatile inventor, and seeming impossibilities become subjective and are rendered inane before the superiority of his mind over matter. To the layman the feat of making connection with a water main without disturbing the flow of water would seem impossible, but the feat has been successfully accomplished through the ingenuity of M. R. Sherrerd, of Newark, N. J., and the device used was patented by him. A double pipe cutter was on the main inside of a water-tight casting chamber through which the main passed. The cutter was operated by a miter gear worked from the outside by a steel rod passing through a stuffing-box in the chamber, and cut out a 10-inch section in the main. This, with the cutters, was raised through a diaphragm into the upper part of the chamber, and the hole in the diaphragm being closed by a slidegate, the two cut ends of the main communicated through the chamber, which was full of water under pressure. The top of the chamber was then opened, the section of pipe removed and the required special valve put in its place. The chamber was then closed, the gate in the diaphragm opened and the valve lowered and forced into position by means of a sleeve around the pipe that passed through the stuffing-box in the chamber and was operated by jackscrews. Preliminary tightness of the connections was effected by rubber gaskets, and after the removal of the chamber both ends of the main were caulked into the new connection.

THE Philadelphia *Item* prints a description of a trial of the Holman engine between Winslow Junction and Cape May, N. J. The results sound revolutionary in engine construction, as the extraordinary speed of two miles a minute was attained. The trainmaster's record says a mile was reeled off in thirty seconds, "beating the world's record by seven and a half miles." The inventor occupied a place in the cab with the trainmaster. This is not a case of a single mile spurt, for the trainmaster says that the test convinced him that this engine can run 120 miles an hour as regular duty.

Scientific Progress.

Length of a Thought.

How long does it take a man to think? Prof. Richet, at the recent meeting of the British Association, gave the results of his investigations into this subject. He found that by mentally running up the notes of the musical scale for one or more octaves and then dividing the total time by the number of notes thought of, the time taken for each note was one-eleventh of a second. There are various ways of arriving at conclusions as to the amount of time necessary for realizing any physical sensation or mental impression. If the skin be touched repeatedly with light blows from a small hammer, one may, according to Professor Richet, distinguish the fact that the blows are separate and not continuous pressure when they follow one another as frequently as 1000 a second. The smallest intervals of sound can be much better distinguished with one ear than with both. Thus the separateness of the clicks of a revolving-toothed wheel was noted by one observer when they did not exceed sixty to the second, but, using both ears, he could not distinguish them when they occurred oftener than fifteen times a second.

The sharp sound of the electric spark of an inductive coil was distinguished with one ear when the rate was as high as 500 to the second. Sight is much less keen than hearing in distinguishing differences. If a disc half white and half black be revolved, it will appear gray when its revolutions exceed twenty-four per second.

It has been found that we can hear far more rapidly than we can count, so that if a clock-clicking movement runs faster than ten to the second we can count four clicks, while with twenty to the second we can count two of them.

A SCOTCH professor writes: "After the most painstaking investigation and experiment, I believe myself justified in saying that I have discovered an absolute antidote for the bite of the most deadly serpent. I have also found that the substance from which the antidote is secured is strongest and best in the serpent whose bite is the most deadly. The antidote is found in the bile of the serpent. To secure it, it is necessary to isolate or separate the antidotal constituent of the bile from the remainder of the substance found in a serpent's gall bladder. The method of the administration of the antidote is that known as injection beneath the skin, so that the antidote may not mingle directly with the blood of the victim of snake bite, but rather be absorbed. I have made a number of experiments with the biliary secretion of the Indian and African cobras, than which no more poisonous snakes exist. The result of these tests showed that the bile of venomous serpents is able, when mixed with the venom of the

same serpents, to prevent what have heretofore been deadly doses of the latter from producing death; and that the bile is indeed so powerful an agent in doing this that a quantity actually smaller than the quantity of venom will be sufficient for the purpose."

Condensing Food Supplies.

Reports from those who are engaged in condensing food make interesting "scientific" reading.

To speak of carrying enough food in a small valise to last a healthy man a year seems fictitious. Capsules, pills, buttons, packages not larger than a pocket-book—are all receptacles for nourishing food. These are for the delectation of those who are suffering from Klondicitis, the new malady caused by the rush to the Yukon, and in whose interest the different chemists are now working so industriously. The present scheme is to furnish Klondike voyagers with condensed foods adapted to peculiar needs. Anything or everything in the way of food can now be put up in compressed form. A cup of good coffee or tea, already sweetened, is crowded into a button. One of these, dropped into a cup of hot water, is all that is needed to convert it into liquid form. All kinds of soups are prepared in the same way. The buttons contain a mixture of meat and vegetables properly seasoned and ready for the hot water. The button craze has evidently taken a new and entirely different aspect from that which prevailed during the last Presidential campaign. Now all you need do is to buy the button, and it may be said you have the rest. Another essential for the Klondike will be desiccated beef, an ounce of which is equivalent to five ounces of fresh meat. It is put up in such hard little chunks that an ordinary knife makes little headway in cutting it. Fine shavings of this make nice filling for sandwiches or can be used for making nutritious soup.

A loaf of bread can be compressed until it is not larger than a cracker. When soaked in water it swells up like a sponge, and when dried out makes very fair eating. A loaf can be prepared in the same way of flour, beef, fat and salt, and contains all the elements of a plain meal. Ten pounds of onions, carrots, potatoes, turnips, cabbage, or any other vegetable, are by the condensing process crowded into one-pound cans, and are said to be excellent for soup-making.

It is to be regretted that the men who expect to make their millions through this scheme will not be ready to launch these projects until next spring. At the present time food cannot be got there as fast as needed, and gaunt hunger shows its fangs, lurks like a wolf about every camp, and can scarcely be appeased.

Doubtless there are many interested in packing food for the Yukon, and it is to be hoped they will send it to them in its best form.

PROFESSOR ROBERTS-AUSTEN claims to have made some recent discoveries on the subject of the interdiffusibility of metals, showing that solid metals may be made to mix themselves as if the atoms were living creatures. He says he has, in fact, discovered pieces of metal engaged in the act of mixing themselves up one with the other. Of course the interest of this is that the interdiffusion of which we speak has been found to take place when the metals were cold, and, though this property in metals, to be capable of attaching themselves one to the other when cold, has been talked about before, nothing so clearly proved has hitherto been at the service of the metallurgists and chemists as the facts adduced by Professor Roberts-Austen. He shows that when clean surfaces of lead and gold are held together in the absence of air at a temperature of 40 degrees for four days they unite firmly and can only be separated by a force equal to one-third of the breaking strain of the lead. The professor has also proved that if a plate of gold be laid under one of lead about three-tenths of an inch thick in three days gold will have risen and diffused itself to the top of the other metal in appreciable quantity.

IN the Transactions of the Society of German Engineers, Professor C. Schnabel discusses the recent progress in the metallurgy of gold. He begins with an interesting summary of Bodlander's researches on the chemical reactions taking place when gold is dissolved in cyanide of potassium. These researches show that the presence of air or oxygen is necessary, for no gold is dissolved in vacuo. Expressed chemically, the gold is dissolved according to the two equations:

(1) $2Au+4KCN+2H_2O+O_2=2KAu(CN)_2+2KOH+H_2O_2$

(2) $2Au + 4KCN + H_2O_2 = 2KAu(CN)_2+2KOH.$

The rapidity with which gold is dissolved in potassium cyanide solution is dependent on the state of division of the gold, and in a secondary degree on the concentration of the solution. Thus granular and laminated gold dissolves very slowly, whilst spongy gold dissolves rapidly. Gold leaf dissolves most rapidly of all. The rapidity of solution increases with the concentration up to a certain degree, and then further increases only very slowly. A piece of gold leaf of given weight dissolved in a given volume of solution containing 0.1 per cent of cyanide in twelve minutes, in a 0.25 per cent solution in five minutes, in a 1.0 per cent solution in four minutes, and in a 3 per cent solution in three minutes. The limit up to which the solution of the gold rapidly increases is thus with 0.25 per cent of potassium cyanide in the solution.

THAT "little drops of water make a mighty ocean" is true, but that they calm the mighty ocean is equally true. When drops of rain fall on the ocean they have been noticed to calm it, although the wind was high. This fact often puzzled observers, until an English scientist found that each drop forces some water below the surface in the shape of rings, which gradually decrease in speed and increase in size, until, 18 inches below, the same motion is caused as above, but in slower time, and, as these two waters exchange places again and again, it forces the wave out and causes a calm sea.

Electrical Progress.

Blue Lakes, Cal., Plant.

IN an article in the October number of the *Journal of Electricity* on the electrical transmission plant of the Blue Lakes Water Co. of San Francisco in Alpine and Amador counties, California, in discussing the hydraulic apparatus and pipe line is said:

"Another interesting feature of the hydraulic equipment lies in the use of strainers for the jets of the exciter wheels. These strainers, which are of solid cast iron construction and located on the fronts of the concrete piers immediately below the wheels, may be compared in action to that of a two-way valve, in that the water for driving the wheel may be instantly made to flow through either one of two courses. These courses are each provided with a strainer of brass gauze so mounted in cartridge form as to be easily removable, and the principle of operation of the apparatus lies in the feature it embodies for permitting the removal and cleaning of one strainer cartridge while the other strainer is in use. Some such arrangement is necessary for the protection of small nozzles using water under high heads in plants where the water may possibly contain twigs or leaves or bits of wood that might cause a shut down because of closing the small orifice in the jet of the exciter wheel. The jets of the large wheels, having greater orifices than the area of the screen openings, are not liable to clogging from this cause.

"From a strictly hydraulic standpoint, the most novel feature in the Blue Lakes plant is the absence of both receiver and air chamber on the pipe line. Accidents that have occurred to pipe lines have been due to water ram caused by the almost instantaneous opening and closing of gates or by collapse due to the formation of a vacuum caused by a choking at the intake or the using or escape of water at the lower end faster than it can possibly enter from the forebay. The gates in the Blue Lakes plant are so constructed that it is a physical impossibility to open or close the main gate in less than ten minutes, nor can either of the quadruple nozzles be closed or opened in less than three minutes, which arrangement, it is believed, allows sufficient time interval to elapse to prevent any possibility of water ram. The pipe line is without air valves in any portion, but the factor of safety in the materials used is so great and the pipe line is so deeply buried throughout its entire length, and so rigidly cemented to bedrock by concrete, and as all parts before installation were subjected to a hydrostatic test of not less than double the working pressure, it is believed that breakage and the draining of the pipe sufficient to cause collapse from atmospheric shock is an impossibility. At present the water wheels are running by hand regulation, but governors will be installed shortly and so arranged that two nozzles of each water wheel will be hooded by the governor and the remaining two will be throttled by hand should occasion require. From the wheel pits the discharged water is carried in individual courses to the tail race, whence it continues underground through an arched tunnel under the grounds of the power house, emptying into the Mokelumne river."

THE *Electrical Review* tells of an intelligent-looking individual who walked into an electrical supply store recently and asked to see the manager. Upon being asked the nature of his business he replied that he had a new form of primary battery which he wished to show. He was promptly referred to the company's electrical expert, who has a faculty of very quickly arriving at the correct conclusions regarding the merits or demerits of any so-called electrical discovery. The inventor(?) calmly informed the expert that he had perfected a battery, a sigle cell of which would have an electromotive force of 40 volts and run a 16-candle-power lamp for five or six hours. After having recovered from his astonishment, the expert, who at heart feels kindly disposed to all struggling "geniuses," invited the inventor to bring around a cell of his wonderful battery and have it undergo a few simple operations, in which a voltmeter, as well as an ammeter, were to play important parts. The inventor said he would be only too glad to do so, as he had a cell all ready in an office a few doors away. He went out and shortly returned, carrying a half-gallon stone jar nearly filled with water, and having a plate of carbon and one of aluminum suspended in it. Taking from his pocket a small flask, he poured about an ounce of a brownish-red liquid into the water and announced that the battery was ready for action. A voltmeter connected to the terminals showed a potential difference of 38 volts. An ammeter connected to the battery (short circuiting it) indicated 2.5 amperes, which, within half a minute, fell to 1.25 amperes, where it remained for several minutes. By this time quite a crowd of interested spectators had asssembled, and the inventor, probably afraid that his secret would be discovered, gathered up his battery and hurried away.

EVERY week now brings news of new electrical enterprises inaugurated or successfully completed in California. The general significance of this new step forward in the application of water power to industrial purposes is startling. On the one hand it signifies that man has at last learned how to effectually master and utilize one of the mightiest natural forces of the earth. Coal is an exhaustible possession, and the day must come when the coal fields of the earth will be worked out. Our rivers and falls offer, on the other hand, an inexhaustible supply of energy; for so long as the heat of the sun evaporates the water of the sea and causes it to fall again as rain upon the hills, or as snow upon the mountains, this source will be available for the supply of man's wants, and the arrival of the time when the earth's coal fields will be exhausted need no longer be awaited with misgivings.

What is Electricity?

The *American Electrician* condenses from the London *Engineering's* review of Prof. Trowbridge's new book, "What is Electricity?" as follows: The writer says that in spite of the all-round progress made during the last thirty years, we know no more about the essential nature of electricity than did Benjamin Franklin 150 years ago. The several explanations offered, based upon the ether, or ether and matter associated, merely substitute one unknown for another. "After all, what is matter? What is the ether? How is matter associated with the ether? To such fundamental questions we can return no other answer than the now famous ignoramus. They make, or tend to make, us painfully conscious of the infinitude of our nescience." The writer of the review adds that Lord Kelvin must have been brooding over these provoking unknowns when he wrote to him in 1892: "Tell me what electricity is, and I'll tell you all the rest." This inability to detect electricity in its primordial form need, however, exert no distrustful, no depressing effects on the mind of the student of physical science. "Let him remember that a ray of light is an unexplained phenomenon; yet what wonderful truths are revealed to Fresnel, what knowledge has been wrested from it by means of the spectroscope, and what marvels is it not every day recording on photographic plates! If he feels himself morosely affected by this agnosticism, let him recall the astronomical phenomena which are accurately calculated years in advance without any knowledge whatever of the nature of gravitation; or let him think of that masterly bit of analysis which led to the discovery of argon without any knowledge on the part of Lord Rayleigh or Prof. Ramsay, of what chemical affinity is. If he is a practical man, let him reflect that the engineer lives amid stresses and strains, and though ignoring the intimate nature of the forces which he uses, builds up powerful engines and dynamos, and as successfully tunnels a Mont Cenis as he throws a bridge across the Hudson or the Firth of Forth."

AS NOTED elsewhere, a water right has been filed in Redding, Cal., for 85,000 inches of the water of the McCloud river. According to local statements, the water claimed under this right is to be flumed from the McCloud river one and a half miles to Pit river, where an electrical and mechanical power station is to be installed. To carry this will require a flume 30 feet wide and 25 feet deep, which seems a large statement. It is further stated that from this station power and light are to be transmitted to the iron mines on Pit river, but the main light and power wires will lead to Keswick and Redding. It is also proposed to supply the towns mentioned with water from the McCloud river. The main leading to the Mountain Copper Company's smelting plant will be 5 feet in diameter and the one leading to Redding 4 feet in diameter. Keswick is the point at which are located the principal works of the Mountain Copper Company, an English syndicate, which has in its employ at present over 700 men.

Electricity reports that in an examination that was made of some "electric belts" sold by a street fakir, it was found that beneath a strip of gauze was a layer of dry mustard. When the wearer perspired a little, the mustard was moistened and set up a burning sensation, and the deluded victim believed a current of electricity was passing through him.

Mining Summary.

CALIFORNIA.

Amador.

The Gover mine is closed down.

The old Douglas mine at Volcano has recently been started up. Fourteen men are employed.

In Plymouth district Supt. Dillon will repair the 350 shaft in the Centennial mine and sink 650 feet farther before running any levels.

Butte.

H. P. Stow is again locally credited with intention to erect a 100-stamp mill at his mine at Forbestown.

Register: R. Andrews has been tracing the outlet of the Cherokee channel of gold gravel, and is certain that he has struck it.

Calaveras.

Chronicle: Assessment work done on the Esperanza gravel claim, in the Banner district, has developed a channel over 40 feet in width, with a depth of 6½ feet of picking gravel going $2 and over.

The Banner blue gravel mine, near the Banner mill, on the Table Mountain channel, was bonded to Colorado parties last week for $28,000, development work to begin immediately,

The Martin, or Table Mountain, gravel mine, near Sheep Ranch, is to resume operations on the 15th of the month.

The Page Cutting gravel mine, near El Dorado, has been sold, and a force of men are now at work thereon.

The 5-stamp mill at Maccaroni Flat, formerly owned by the Fairplay & Shawmut Mining Company, was dismantled last week by M. McNicholas and has been moved by C. Bund to the Phœnix gravel mine in San Andreas. Supt. Jennings expects to have it in operation soon.

The Live Oak mine, in El Dorado district, owned by W. B. Swank, now has a 2-stamp prospect mill operating under 75 feet head of water. One hundred tons of ore are on the dump, averaging $8 in free gold and 1½ per cent sulphurets.

Twenty men are at work at the Lone Star mine, in West Point district, bonded by the Farrington Gold Mining Company, A. Pugh, superintendent. The shaft will be sunk to 500 feet.

The Paragon mine, in West Point district, is to have five more stamps. Under the superintence of P. L. Shuman, an electric plant has been installed, there being 600 feet head available from the Harris ditch, which is also used to run the mill. About twenty men are employed.

The mill on the Innes mine, near Mokelumne Hill, has started.

Del Norte.

A Cres cent City report is to the effect that in the completion of a contract with the Ora Anna Gold Quartz Mining Company there for the sinking of a shaft upon its lead to a depth of 100 feet, the final blast showed ore containing free gold. The Ora Anna was discovered many years past when the adjacent grounds were being worked for placer gold. In 1888 a company organized under the title of the Bald Hills Quartz Mining Company located and commenced operations upon the mine, doing considerable work, but with no positive results as to the determination of its richness or extent. The present company was organized three years ago.

El Dorado.

H. Sexton is at work on the Utah mine in the Kelsey mining district. A tunnel will be run and a shaft sunk.

At the Diamond mine, or Limpinsel, work on a 200-foot shaft has begun.

Work of sinking from the 300 to the 400-foot level at the Gentle Annie is completed.

The Big Sandy, in the Kelsey district, is being worked under lease to Jas. Kelley.

The Larkin property, near Diamond Springs, is transferred to the Larkin and Selby Mining Company, W. Larkin, superintendent.

Inyo.

Independent: The new dry concentrator is built somewhat on the basic plan of the old-time dry washer, the gold and sulphurets being separated from the pulp by agitation, causing openings or crevices in the latter which permits the heavier particles to fall by specific gravity to the riffle board. With the dry washer the blast which separated the pulp and mineral could not be regulated, but with the concentrator this is governed altogether by the operator. The ore is dumped from the wagons into a bin, where it is fed by an automatic feeder into the crusher, and as the pulp leaves the crusher it is taken by elevators to the cupola of the mill-building, where it passes through a 100, 80 and 60-mesh rotary screen. Should any of the pulp be too coarse to pass through the 60-mesh it runs into a tube and is carried back into the crusher. Below the screen is a bin which catches the pulp as it falls, and from this pipes lead into the hoppers of the machines. An eccentric feed and automatic gate in the hopper regulates the flow into the sand chamber. This chamber must be kept full at all times. From the sand chamber the pulp drops upon the riffle board, which is made of silk bolting cloth, and across which wires are sewed on at intervals of half an inch. The riffles travel upward at almost a snail's pace towards the hopper, and below it the blast is placed in a tight-fitting compartment. The blast is variable, and can be regulated by the operator from naught to nine, according to the character of the ore treated, that carrying heavy gold and sulphurets requiring a light blast, and vice versa. As the pulp passes over the riffles interstices are caused by the blast, through which the gold and sulphurets are carried by gravity to the bottom and are held by the cross wires, while the pulp, which now becomes tailings, except for the chlorides and light gold, passes downward to the back of the machine, where another blast forces these lighter particles into two pipes arranged on each side of the machine, and carries them into the chloride house, an airtight building erected outside of the mill. So far the percentage of chlorides and light gold has been so small that it could scarcely be treated. The gold and sulphurets, after being deposited against the riffles, are carried over the front of the machine and deposited in a box set for the purpose. The small amount of concentrates which may cling to the riffles is carried under the machine and is knocked off onto a blanket by a "knocker" automatically arranged. The concentrating power of the machine is governed altogether by the operator, who, by raising or lowering the tables on which the riffles are arranged, can reduce the concentrates to a minimum or permit them to carry a large percentage of pulp. With rich ore the reduction may be only five, ten or twenty into one, while with low-grade ore it may be run from forty to 800 into one. During a test run this week a reduction of 800 to 1 was made on some $1.25 rock, and the concentrates assayed $879 to the ton, while an assay of the tailings in one instance showed nothing, and in another a trace of gold. The machines cover a floor space of 3x6 feet. Each machine is claimed to be capable of handling ten tons of ore in twenty-four hours, and a 2 H. P. gasoline engine furnishes power enough to run four of them. During the mill tests the lowest percentage saved was 71⅓ and the highest 98. On the desert the success of the concentrator opens up, it is believed, a new chapter in mining there, for in the past ores that ran less than $20 per ton were consigned to the waste dump. The Alameda plant consists of four machines, and thus far has cost about $12,000. Two shifts of three men each will be able to handle forty tons of ore every twenty-four hours.

Kern.

The *Times* has an encouraging account of Soledad Mountain, in the Mojave mining district. Soledad Mountain is located about four miles south and one mile west of Mojave. It rises prominently out of the desert to 5000 feet above sea level. There are eighteen hills in the Soledad group, all of which are staked out into mining claims, and on a majority of them the assessment work has been done. From some of these claims a considerable amount of ore has been shipped to the smelter in San Francisco. With reduction works on the grounds, there are hundreds of thousands of tons which might be worked at a profit. A company known as the Double Standard Mining Company has been organized, which will work half a dozen claims that make a big showing on the surface. An offer has been made for the ore on the dumps of two claims at this camp at the rate of $50 a ton.

Teams are hauling ore from the Aitken antimony mines in Lone Pine canyon, seventeen miles northeast of Mojave. A carload of the ore will be shipped this week to New York City, and regular monthly shipments will be made hereafter. The ore from these mines is of high grade, and free from all impurities, which makes it a very desirable ore for the antimony smelters. The mines are owned and operated by George Aitken, who is developing the property. About one-half of the mineral taken out of the mines is considered sufficiently clear to sack and ship without careful sorting, and the balance, which will run 25 or 30 per cent of antimony, is piled on the dump until enough has accumulated to warrant putting up a concentrating plant. There is wood and water in the vicinity of the mines.

F. O. Wilkenson says in the *Times*, of the Piute mining country: "The mines are on the top of a table mountain fifty miles northeast of Mojave in a basin 6600 feet above the sea. I bought the old abandoned Wheel of Fortune mine; went to the bottom of the 50-foot shaft; commenced sinking deeper; struck sulphide ores; have gone down 55 feet. About eighty of us are in camp now, and we are preparing for the winter. We have lots of snow upon the mountain, but we have as well any quantity of water and timber."

At Randsburg labor troubles which have been brewing for some time culminated on the 9th, when about 100 members of the Miners' Union went in a body to the Roxie mine and peremptorily ordered the superintendent and men out of the camp for working below the schedule of the Union, which is $3 per day for eight hours' work. The men were C. N. Clark, superintendent and part owner, C. Couch, L. Richardson, F. B. Nutting and L. Butler. A. Dailey joined the Union in preference to taking a moonlight walk, but the others all started with their blankets on their backs.

Mariposa.

(Special Correspondence).—E. C. Loftus of San Francisco has a force of men at work on the Flyaway group of mines, situated on a spur of the mother lode about five miles southeast from Coulterville. About three years ago Philip Corcoran, Darling and others induced the owners of the six claims comprised in the group to sign a bond for these properties, which bond, with the sole provision that the parties bonding should "begin" work before a specified time, ran forever. As a result the property has been tied up ever since. It is presumed that Mr. Loftus has found means to arrange the difficulty.

The Merced Company has begun the work of enlarging the present two-compartment shaft on the Mary Harrison to a three-compartment. As soon as the enlargement reaches the present bottom of the shaft (175 feet) the work of sinking the main shaft will be begun. With the present size of the shaft it is not practicable to sink without shutting down the mill. Another body of high-grade ore has been opened on the 600 level of this mine.

A strike of considerable promise has lately been made by the Shafe brothers, about six miles northeast from town. They have been sinking on a large east and west vein which has generally been accounted barren, and at a depth of 30 feet have cut through 8 feet of ore running between $20 and $30 per ton. A number of locations have since been made in the vicinity of the Shafe claim.

Coulterville, Nov. 10th, '97.

The opening up of low-grade mining properties in some portions of Mariposa county has been made possible by the construction of the San Joaquin Valley Railway. Heretofore the Southern Pacific had charged $7 a ton on $100 sulphurets, which, in numerous cases, was prohibitive. By the competition of the new road, the rate from Merced to San Francisco has been reduced to $2.75 a ton in carload lots. In the case of several mines the difference represents the profit on mining, milling, transportation and smelting.

Nevada.

Telegraph: Supt. Deasy of the Diamond mine, acting for A. C. Widbur of San Francisco, has contracted for the purchase of the Pine Nut claims, eleven miles from Grass Valley. Suitable machinery will be erected, and in all likelihood a 20-stamp mill will soon be on the ground.

Tidings: At the Reddik mine the drift is in 70 feet from the foot of the 500-foot incline. The prospects are favorable.

At the Stanford mine, near Nevada City, Supt. Jos. Thomas reports that the drain tunnel, 600 feet long, is cleaned out; also, the 300-foot shaft. Sinking was begun on Wednesday. Drifts will be run north and south to exploit the mine. The Stanford is under bond to Edward Coleman, Jacob Neff and others.

Union: A clean-up of $1940 is reported at the Unity mine, the result of a three weeks' run. The ore paid $18.50 per ton. A new ledge was also struck yesterday in the main 200 level.

San Bernardino.

Large loads of supplies have been going to Virginia Dale from San Bernardino during the past few weeks. There are quartz claims and placer mines, and some good specimens of gold are shown. The gold is coarse, pieces running as high as a dollar in value. Some of those who are dry-washing are said to be making from $1.50 to $5 a day to the man.

At Victor considerable activity is reported. The Sidewinder has men at work on the 400-foot level.

The Boston Mining and Milling Company has begun the wall for a 10-stamp mill, with concentrator. It is proposed to handle all qualities and grades of ore.

The Old Judge mine, twelve miles from the river, has men at work at 150 feet, with a 6-inch ledge of good ore.

The Rose mine continues shipping ore.

San Diego.

The Signal Hill Mining Company was incorporated under the laws of Arizona, October 29, 1897. Capital $1,000,000. A stamp mill is to be erected at once.

Shasta.

A new strike is reported from the Whiskytown district, near the Iron Mountain road, about five miles north of Shasta. Robt. Small is the locator. The ledge shows a width of 6 to 7 feet near the surface and carries free gold.

The *Mountain Miner* says that the smoke has been very dense around Keswick the past few mornings, 89,000 tons of ore being lit up on Tuesday last in one heap. The new roaster beds that are being built on the hill will be still larger. It is estimated that 125,000 tons will be burning there at one time.

A. G. Annis has a machine he calls a monitor, which is sunk in the river through the center of a boat 20 feet long. A cylinder of iron, 3 feet in diameter at the top, 5 feet at the bottom, with two windows at the top, is lowered through the hole in the center of the boat to the bottom of the river. A man enters, descends, the cylinder is closed at the top, air is forced into it, and the workman descends to a dry surface at the bottom of the river to work the gravel. The compressed air, which clears the cylinder of water, is also applied in elevating the gravel through a pipe inside to the deck of the boat, where it is deposited in sluices and washed. Mr. Annis says that he has given it a thorough test, and has worked three men in shifts of four hours each, and that the returns in gold are entirely satisfactory. His patent is on that part of the machine which forces the water out of the cylinders and the gravel up to the top through the pipe inside.

Free Press: One of the largest water locations ever filed in this county is filed for record by B. C. Hall. The location claims 85,900 inches of the waters of the McCloud river. He proposes to divert the waters from the stream at a point on the east bank in the north ⅛ of section 12, and to convey them in a flume 30 feet wide and 25 feet deep a distance of 1½ miles to a point in the northwest ¼ of section 14 and southwest ¼ of section 11, where he proposes to generate electrical and mechanical power. The electrical power will be used for mining purposes in sections 23, 26, 34 and 35, and will also be conveyed to Keswick and Redding. The former town will also be supplied with water from a pipe 4 feet in diameter and the latter with a 3-foot pipe. All of the sections of land enumerated are in township 34 north, range 4 west, M. D. M.

The small smelting plant at the old Afterthought mill near Furnaceville on Cow Cow creek, F. R. Enright manager, will shortly resume operations after an idleness of about a year. During the long period of idleness at the smelter, work was continued somewhat irregularly at the mine. The supply of roasted ore on hand exceeds 900 tons.

Sierra and Mariposa.

The Sierra Buttes G. M. Co., held its 55th general meeting in London on the 23rd ult. Chairman F. Tendron said: "Our expenditure on the Mammoth must for the present come to an end. I think Mr. Johns holds the same opinion himself. We are very loth to give up a property. The money we hope to make out of the Whitlock will have to be spent in developing the old Buttes mine. The small 10-stamp mill that we put up in 1890, and the improvement of the flume at that time cost us £1,500; and by working the ore that was on the dumps, and the ore that was accessible on the levels, but too poor to satisfy the former owners or ourselves, we realized in the course of time a profit of £12,575. We are going now to put up a 20-stamp mill on another part of the property, using the materials of our unused Yuba mill. They are going to repair the flume, and to drive a tunnel into some of the old workings in the Buttes, and the estimate of the cost is only £1,600. We are willing to authorize the expenditure to go up to £2,000, and Mr. Johns has been instructed to push on with the work so as to get the flume repaired before the winter sets in. If the flume were destroyed we could never go to the expense of rebuilding it. It is a long flume, and it would be a very expensive work; but if it will stand the storms of the winter, then we will take our chance of getting this £2,000 back. The Buttes has absolutely nothing, for if the Buttes is charged with the full moiety of the £61,000, expended on the new mines, it can just discharge its liability, or, at all events, within £300. As we have made some little profit since June 30, with its share of the profit, it could discharge its liability, and, therefore, for the moment we may look upon the properties as entirely belonging to the Eureka. The Eureka has the money, and it has cash and investments, after paying off the creditors, who are few in number. Including the materials at the different mines—the stores that are worth money and that will be used up in making a profit—it shows a balance of £25,716, and the securities are enhanced in value £2,745, so that the Eureka commands over £28,000. Now, £28,000 is not sufficient to buy and develop a mine that is worth having. We must have the Whitlock made a success. Whether it can or cannot be made a success I am unable to say; but I only see one way in which it may be made a success, and that is for Mr. Johns to leave everything else and to confine himself almost entirely to the superintendence of the Whitlock. He may pay an occasional visit to the other mines, and he may see that things go on properly at the Buttes in regard to the expenditure of the £2,000 we have authorized; but if he has that deep regard for the company that he has always professed, I think it is his duty—and it is the only thing he can do to give the board satisfaction—to devote himself entirely to the Whitlock, and if he makes the Whitlock a success, then will be the time for us to see whether we can once more take a certain amount of risk in looking out for a new property. I may tell you—for it is about the only satisfaction that I have—that we have paid you in dividends, including £63,000 from the Uncle Sam, £857,746; and, in addition to that, without preference shares, loans, bonds, or anything else, the Buttes and Eureka have between them these new properties and the Eureka has in addition its £28,000 of reverve. I now ask you to adopt the directors' report." Mr. T. continued: "The uncertainty of mining is shown clearly in a letter we have received this morning from Mr. Johns. In consequence of our having bought this Mammoth mine, some friends of mine, in connection with another company, rich Americans—Messrs. Rosenfeld & Sons—thought that they would look into the neighborhood, too, because we were very sanguine about this Mammoth on the mother vein. They bought a property which is not more than two miles from us. We saw this gigantic outcrop of dead-looking quartz that had been explored over and over again and would not pay. Well, they spent $200,000 there, and at last they reached, not the vein they had been working for, but by a crosscut they reached an eastern vein. I will read you what Mr. Johns says, for this is a matter of interest, because some day or other we will take up this Mammoth mine again. You never know in mining what may happen. The chairman then read an extract from the latter referred to, which stated that the Eagle mine, now owned by Messrs. Rosenfeld, was developing into a big property, and it looked as if it would prove one of the best mines on the mother lode in the country. Mr. Louis Rosenfeld has told him (Mr. Johns) that they would spend $200,000 on it before giving it up. They had now a good property, and were likely to be amply repaid for their outlay."

Siskiyou.

(Special Correspondence).—Prospecting for quartz is practically a new thing in the neighborhood of Callahan Ranch. G. A. Warder is operating a 2-stamp prospect mill on a porphyry dike 70 feet in width between two slate walls.

From Hornbrook to Orleans Bar, a distance of 140 miles on the Klamath river, the wing-damming of the streams is almost exclusively in the possession of Chinese. It is thought that 95 per cent of their product never becomes known to the statistician. The same is said to hold for Scott river and the branch creeks on both streams.

W. C. Stanley, superintendent, is hydraulicking in the Happy Camp district, fifty four miles west of Yreka, running two giants. The owners are a Colorado company. They have 600 acres and 4000 inches of water. The gravel is from 18 to 20 feet and the gold is evenly distributed. This is known as the Minetta B. Hydraulic Co.

Work on the Bunker Hill mine will be resumed under the management of G. B. Templeton.

The Siskiyou Mining Co. is putting in an electric plant.

Work has been suspended until spring on the Loftus Bros. and McCauley copper mine near Fort Jones.

At the Shores ledge Major Myers has finished crushing the ore taken from tunnel No. 3 since May 1st. The yield was over $22 per ton. In addition, he cleaned up with mortar

and pestle from the same tunnel about $4000. He is now working his ledge at four different places.

A large ditch is being constructed to take water from Elliott creek, in Siskiyou county, to claims on the headwaters of Applegate, in Jackson county, Oregon.

The compressed air machinery has been taken out of the Allen Bros. quartz mine. M. Allen has bought out the late owners and will try to develop a new pay chute.

A talc vein has been opened at the south fork of the Salmon varying from 2 inches to 2 feet in thickness and yielding $200 per ton, worked in an arrastra run by horse power.

Mr. Bradley, superintendent of the Golden Star Mining Co.'s work on the Spencer mine, has had a survey of the property made and will drive an 880-foot crosscut to tap the vein 550 feet deep.

The affairs of the Belcher Placer Mining Co. have been arranged satisfactorily to the stockholders. It is understood that San Francisco capitalists have secured a controlling interest and will immediately put the property in shape to work.

The Minetta B. mine has been shut down pending the putting in of a hydraulic elevator and electric light plant, which is now on the road.

The Spencer mine, operated by the Morning Star Mining Co., is working three shifts of [illegible].

Work on the Klamath Chief group of mines, below Happy Camp, is progressing. The Chicago Mining Co., who own this mine, expect to have everything in shape to begin piping by January 1st.

C. B. Poole's quartz mine, west of Cole's, has been sold for $30,000. The first payment of $5000 has been made and the purchasers are preparing to give it a thorough development this winter.

Journal: The best strike which has been made lately is that at the Commodore mine on Barkhouse creek. This ledge is owned by Messrs. Humphreys & Quigley, who have been doing a great deal of development work during the past year. Last week they ran onto some exceedingly rich ore, taking out over $500 in a very short time, with a quantity of the same character of ore in sight. The Commodore mine is situated at the head of Barkhouse creek, about thirteen miles from Scott Bar.

The Klamath river dredger is still at work on the Klamath river, below Oak Bar, where it has been handling good pay gravel for some time past. The dredger is kept in operation most of the time.

The Blue Gravel mine, just south of Yreka, is said to be paying better than ever at present, and a large force is kept busy night and day taking out gravel.

The mines in the vicinity of Oro Fino will probably be started up by holiday time. The Eastlick Brothers' mine, as well as the Gardiner and Wright & Fletcher mines, are all being put in readiness to commence operation as soon as there is sufficient water. They hope for a longer season this year than they enjoyed last year. This group of mines is among the richest hydraulic claims in the county.

Journal: R. S. Lenhart, after eight months' perseverance, has finally secured the Gold Ball quartz mining property, near Sawyer's Bar, by settling up the outstanding claims. He is now fitting up the mine and mill for active operations, and expects to have everything in readiness by Dec. 1st. This is one of the richest quartz ledges in Siskiyou.

The Allen 5-stamp quartz mill, in Quartz valley, is taken down. The stamps and boiler will go to Henley, and the remainder of the mill will be shipped to Harrison Gulch, in Shasta county.

The hydraulic mines along the Klamath river will soon be enabled to start up again, especially if it storms a few days longer. Most of them are kept in operation most of the time, but this year the water supply has been unusually short, causing them to close down for a much longer period than usual.

The Morrison quartz mill is now crushing ore from the David Jones ledge in that vicinity.

P. W. Pyne has discovered a promising ledge of free gold ore six miles west of Delta.

Trinity.

(Special Correspondence).—J. R. Stoddard & Co. are developing a property on Castle creek, six miles N.E. of Cinnabar. A tunnel is 35 feet on a 6-foot blanket ledge; the ore at 52 feet depth assays $182.57 in gold.

The Altoona Quicksilver Mining Company is placing pumping machinery, and meanwhile the furnace is idle. Steam power is used. At a depth of 550 feet the ledge averages 10 feet. The product is about 500 flasks per month. The mine is said to produce the finest specimens of ore in the world.

Cinnabar, Nov. 3rd, '97.

(Special Correspondence).—The Compagnie Francaise des Placers Hydraulic has just completed a new pipe line which is of considerable magnitude. Water is brought from Canyon creek, a distance of nine miles, and is 3000 inches in volume. The flume across Canyon creek is 2000 feet, and the entire amount of flume in the canal is 1½ miles. Across a divide of 2200 feet, 200 feet in depth, is a syphon 34 inches in diameter. From the top of the bluff the water is dropped through a 36-inch No. 6 iron pipe for 552 feet at an angle of 42°. It is then carried across the river through three pipe lines on a suspension bridge 5700 feet. From the bridge the pipe line is 4000 feet up hill to a ditch one mile in length, from which it empties into a reservoir that supplies two giants.

The method of laying the pipe across the bridge and up the steep bluff was by means of a cable and trolley operated by a 3-foot Pelton wheel. Instead of cogs, a compressed paper wheel on the friction process was used. The cable and 4-wheel trolley, together with paper wheel, is Mr. Saladin's invention. He uses this same method for moving boulders in the mine. It carries boulders weighing three tons.

The joints of pipe across the river to the top of the bluff are riveted so as to make the entire 5700 feet one continuous piece. On the bluff it is bolted in bedrock by steel bands.

The company owns 700 acres, of which 500 are hydraulic ground. They operate a sawmill, telephone line and an electric light plant. Mr. E. Saladin is the superintendent. He operates from seven to ten months of the year and employs fifty men.

Junction City, Nov. 4th, '97.

(Special Correspondence).—Geo. L. Carr is doing development work on the Boulder property, six miles from Carrville. A crosscut tunnel is in 125 feet at a depth of 250 feet. The property comprises eight claims.

Out of 500 locations made during this summer's rush into the Coffee creek section, I am told that the assessment work has been recorded on 300 claims.

On the Forget-Me-Not, one mile from town, G. L. Carr took fifty tons of rock at a depth of 175 feet, which he ran through an arrastra, and he claims it netted him $115 per ton. He intends running another tunnel at greater depth.

Peterson & Ruggles have three claims on Scorpion creek, seven miles N.W. of Trinity Center. They have run an 80-foot tunnel on the vein, which they call decomposed quartz silicate. They are now completing an arrastra.

F. L. Dimock and others of Trinity Center have run a 150-foot tunnel, expecting to tap the ledge within 20 additional feet. The property comprises seven claims. The croppings are said to average 160 feet in width, and fifteen assays yielded an average of $15. The ore is gold and copper, similar to that of the Iron Mountain product.

At the Strode mill, six miles above Trinity Center, a 5-stamp mill is operated during the summer and autumn by water brought from Trinity river. The lowest tunnel is 580 feet on the vein and 900 feet from the apex. The hanging wall is porphyry and the foot is slate. The vein matter is 9 feet wide and is a fine sand-like substance, which, when washed, shows fine grains of white quartz. They call it here a decomposed schistose. It averages $16 per ton. From the surface to a depth of 340 feet the ore paid $225 per ton. J. S. and J. C. Strode of San Francisco are the owners.

The Bonanza King, nine miles N.E. of Trinity Center, comprising eight claims, owned by Wm. Vollmers & Co., has 700 feet of tunnels on a ledge running from 4 to 25 feet. They have three chutes. The formation is porphyry and schist. The sulphurets run $300 per ton. A 5-stamp mill run by water is operated nine months of the year.

P. Holland is ground sluicing sixteen miles N.E. of here. He owns 400 acres, and uses 20,000 inches of water at intervals, after large blasts. His reservoir covers an acre of ground and averages 7 feet in depth. He works about eight months of the year.

Trinity Center, Nov. 6th, '97.

According to the Trinity *Journal* the great siphon put in by the La Grange Company on the line of the Stuart's Fork ditch was successfully tested last week. Water was turned in and it was found that there had not been a flaw in the engineering work. The trestle on which the pipe rests in crossing the gulch also stood the test. It was a large and an expensive undertaking, and the officials of the La Grange Company express great satisfaction at the successful result.

Tuolumne.

The Sonora *Democrat* reports a strike in the Kanaka mine. The last two mill runs of about fifteen days have each yielded over $4000, so that, estimating the crushing capacity at one and a half tons per twenty-four hours to the stamp, the rock is averaging from $17 to $18. I. G. Moodey is superintendent.

Men are unwatering the App mine preparatory to resuming operations.

The shaft in the Dutch mine is down 500 feet. A station is now being cut out at the sixth level. The company is putting in a Gates canvas plant for the catching of slimes, just below the mill.

The Dreisam Mining Company, a San Francisco corporation, has purchased the Easton group of mines, near Arrastraville. C. P. Grimwood, one of the owners in the Dutch mine, will be the superintendent.

Mr. W. B. Buckminster, general manager of the Santa Ysabel Gold Mining Company, says: "No ore has been stoped from the richest deposit, the Knox & Boyle chute, on account of the breaking of an armature connected with the hoist in that shaft. Just as the mill was ready to run continuously, a sudden and unexpected failure in the supply of water for the plates and batteries occurred through the exhaustion of the reservoir of the Tuolumne Ditch Company, causing a complete shutdown at the mill. We have ample steam power to run the same, as well as the hoists, but need water for the plates and batteries. The rains are due any day now. The debts of the company are less than $80,000, and this includes the cost of the mill and development expenses for about a year." Supt. Newcomb says he is confident that as soon as the rains come to furnish water for the plates and batteries, the ores now in sight will pay expenses of operating and ordinary development, and a profit. He advises pushing the work of sinking to a lower depth to reach the richer bodies of ore, which the experience of other neighboring mines shows will undoubtedly be found there, from the chutes already developed.

In the Alameda the drifts north and south on the 500 level are being advanced. The south drift is now in 75 feet and the north drift 130 feet. The ore shows free gold.

At the Alabama sinking in the shaft is resumed. The rock is very hard and progress slow. Some good ore is being found in the drifts on the 300 level.

The App force has been increased. Much development work will be done during the winter.

The Omega Mining Company has bonded the Longfellow mine at Groveland and put men to work.

The Jumper mill is running full time. The company expects to start sinking the vertical, two-compartment shaft next spring.

Independent: At the New Year's mine, on the North Fork of the Tuolumne river, developments are being vigorously pushed and machinery is almost daily hauled in.

J. P. Kerrigan of San Francisco has bought the Lost Fox. There are two tunnels. Recent assays show $54 to the ton.

The Modoc has started up and machinery put in.

Yuba.

The Con. Nugget and Coranado M. and M. Co., at Smartsville, propose to furnish electricity for power and lighting.

Several bids are being received for dredging the Sacramento under the direction of the Board of Public Works, which is acting under authorization of the Legislature, $800,000 having been appropriated for the work. Calls for specifications are coming in from contractors from all directions.

NEVADA.

Turquoise has been discovered recently in Lincoln county, at the foot of Sugar Loaf Peak. The country rock is mica schist. The zone in which the turquoise is found is about half a mile long. In this zone there has apparently been no fissuring, with the exception of the intrusion of one large dike, which is about 250 feet wide, and shows clearly for 4500 feet in length. The largest and purest specimens of turquoise are found in this dike, sometimes showing on the surface, in nodules which vary from the size of a pinhead to an average walnut. Two crosscuts have been driven to open the turquoise bearing rock, one at a depth of 35 feet and the other at about 25 feet. A shaft 25 feet has also been sunk, besides several 10-foot holes. The largest of the stones, up to date, weighed 64 carats, with others ranging from 10 to 20 carats.

Lyon Co. *Times*: The cyanide plant being erected in Six-mile canyon by Harris, Blood & Co. is nearly completed, and will probably be running next week sometime. Thirty men are now at work on the plant, and the company hopes to make a test run before bad weather sets in.

White Pine *News*: The McEllin mine, near Hamilton, in the last two weeks have shipped over the E. & P. line about 75 tons of ore which goes from 60 to 75 per cent lead and about 25 ounces in silver.

At Bullionville, Lincoln Co., preparations are being made to work the Godbe tailings—200,000 tons—by the Pecks, whose concentrator has worked a revolution in many localities.

Austin *Reveille*: General Manager Farnsworth has closed down the coal mine at Crum canyon for the winter, and all the men have been discharged. Operations will be resumed in the mine next spring.

OREGON.

It is reported that negotiations are pending with New York capitalists for the sale of Wimer Bros.' hydraulic mines in Waldo district, Josephine Co.

The annual meeting of the Southern Oregon Mining Association is called for Nov. 17th, at 7:30 P. M., at Grants Pass, at the office of the secretary.

The *Democrat* says that the Con. Virginia mine at Baker City is an extension of the Virtue, and when the ledge is struck stamps will be put in. Over $100,000 has been already expended, and there is every prospect of its being as good a property as the Virtue. The property is owned by David Keith of Park City, Utah, who is now crosscutting to the vein from the 600-foot level.

BRITISH COLUMBIA.

Camp Fairview, Okanogan District.—(Special Correspondence)—The mill for the Tin Horn mine is complete and will no doubt be in operation before this is in print. The statement in an Ottawa paper that water would have to be pumped three miles up hill from Okanogan river is incorrect. Pipes have been laid from two creeks which, it is said, will provide ample water the year around. The mill has a capacity of seventy tons a day, and at present there is enough ore on the dumps to last three months. There are 1300 feet of tunnels on the Tin Horn mine. It is said that if this company can save $10 on the plates a dozen more mills will be erected in the camp.

The Winchester Company are arranging for the erection of a mill near their properties, the Winchester and Stemwinder claims. Tin Horn stock is being transferred at 90 cents, Winchester at 30 cents.

Cayoose Creek Camp, Lillooet.—(Special Correspondence)—The Golden Cache mill is running night and day. It commenced Nov. 3 and will be continued for thirty days. The company have announced that this will be a test run. Golden Cache stock is being transferred at $1.60, 20 cents below the price paid for 100,000 shares by M. Oldroyd and others.

The Excelsior mine, next to the Golden Cache, has two tunnels driven in on the main ledge. The vein showed little value on the surface, but rapidly increased in width and richness as depth was attained. No. 1 tunnel is now in 145 feet. The vein is 20 feet wide between walls. Rock on the face of the tunnel assays $177. This was a random test, but, of course, not an average one. The decomposed quartz, 6 inches thick on the foot wall, assayed $856 in gold. This stock has been put on at 30 cents, but is to be taken off on the 15th of November.

Howison Lake District, Five Mountain Camp.—(Special Correspondence)—The entire attention of the camp is still centered on the Money Spinner claim, and the prosperity of this camp will depend on this claim. The mill of this free milling property is covered in and the approach of winter will not prevent the machinery being established. The company claim they will be ready for crushing on Dec. 1st. The work on this mine, besides the surface tests for 1500 feet, is a tunnel 140 feet in and a winze 80 feet deep. The tunnel is 6 feet wide at 140 feet and the winze 9 feet wide. What makes the property so valuable is the fact that the assays of comparatively large blocks of ore have been so satisfactory—the company not being content with more than half a ton test at a time. This stock jumped this week from 50 cents to $1.

The Coast.—The Channe Company, having sold their claims at Phillips Arm for $10,000 and 30,000 shares (£1 shares) of the Gold Fields of B. C. Company, are buying new claims in Kootenay. The stock of the Channe Company fell from 23 to 5 cents some months ago, owing to internal dissensions in the company. New officers have been elected and the 30,000 shares mentioned are being sold in England, the first proceeds ($10,000) having arrived this week. In a short time, according to an official statement, the Channe Company expect the entire $150,000. Dividends are to be paid, according to the statement of one of the company, on the arrival of every $50,000. Channe stock is now quoted at 8 cents.

The Wonderful property, near Sandon, has always been considered a phenomenon in silver mining, the pay ore having been taken from a blanket vein lying practically on the surface, by ground sluicing and hydraulic work and the property is known throughout the Slocan as the only silver placer mine in the world. While the pay ore has been taken from the surface, every effort has been made to locate the main vein, which mining men firmly believe to exist at a greater or less depth. Much money has been spent in opening tunnels in the vain attempt to find the lead.

Rossland has eighty-nine mining claims located within the city limits, seventeen running. It is a rich city for a new one, as its wealth is set down at $23,000,000, which gives a per capita of $3,000. Among the mines within the limits of the city and in operation are the Le Roi, War Eagle, Center Star, Nickel Plate, Iron Horse, Iron Colt, Kootenay, Columbia, White Bear. The Le Roi has paid $575,000 in dividends.

At Sandon, the difficulties in which the Noble Five mine is involved are still the subject of much discussion. The property is idle, and must remain so until after the adjourned meeting of the stockholders, Nov. 25th. The proposition was to borrow $150,000, out of which the indebtedness of the company was first to be settled, and the balance, about $115,000, was to be used in pushing further development work, setting aside a sum to meet current expenses. Much local dissatisfaction is expressed with the management of the property. It is asserted that sufficient treasury stock was sold to develop the mine and pay for the plant, and as the mine shipped steadily, the stockholders are at a loss to know why the business has become so heavily involved. The belief is freely expressed that under judicious management the mine would become a profitable investment. Apparently, however, the only solution of the difficulties will be the appointment of a liquidator and the sale of the mine.

There have been sold 300,000 shares of the capital stock of the Virginia Gold Mining Company at Rossland to Geo. Pfunder, who is understood to represent the Monte Cristo interests, at 12½ cents per share. The remaining 200,000 shares are largely owned by the Corbins, Herricks, Roberts and their associates. Mr. Pfunder says that his principals are prepared to expend $100,000 in the development of the property.

At Nelson the Hall mines stockholders have been notified that a dividend will be paid on the preference shares for the year ending September 30th at 7 cents per annum. The smelter shipped for the week ending Nov. 6th 1100 pounds of copper, 81 ounces of bullion and 80 tons of matte, all valued at $79,253.08. For the period of thirty-two days 6210 tons of ore were treated, turning out 522 tons of matte, containing 98 ounces of gold, 249 tons of copper and 141,860 ounces of silver.

ALASKA.

The Bald Eagle Mining Company has temporarily shut down the mill at Sumdum. Work progresses on the upraise from the lower level to the upper one. A distance of 125 feet has been driven, leaving 100 feet yet to go to connect the two points of the mine. The tunnel runs in on the vein for 110 feet; the ore in the face is 8 feet wide. A shaft has been sunk from the tunnel level down to a depth of 35 feet right on the vein, but at the end of the ore chute. Sixty feet up in the upraise the sulphurets went $1,500 to the ton. From the upper works to the mill was a flume 4,000 feet long and 6 inches wide, lined with sheet iron. Down this flume the ore was run. Recently it was taken up, to be put in a more convenient position; after sweeping it down, the concentrates which had accumulated in and about it were gathered together, and amounted to $6,000, or equal in value to $1.50 a foot. The flume, together with the rock breaker, have been moved to the mouth of the tunnel. It is in contemplation to build a mill on the beach, a distance of 9,400 feet from the mouth of the big tunnel, and make connection by tramway. The average mill returns of the ore from this mine for three years has been $27 a ton.

THE KLONDIKE.

The steamer Homer, from Juneau, brings the latest news from the Klondike. Among her passengers was C. C. Burns, who left Dawson City Sept. 23d. He poled up the Yukon and came out over the Chilcoot trail. Burns stated that when he left Dawson no one had started down the Yukon for provisions. The people were daily expecting boats from St. Michael. He said that there will be no starvation at Dawson this winter, though rations would be limited with some. According to Burns the only new gold discov-

eries made this year were on Sulphur creek, and that field was not proving as rich as El Dorado or Bonanza creeks. Burns brought down with him about $6000 in nuggets and dust, the result of two years' work.

UTAH.

At Silver Reef the Barbee mill is being operated by Woolley, Lund & Judd on ores from the Christy and Stormont mines. During October 8678 ounces of fine silver were produced. The plant is operating on custom ores only and will continue throughout the winter at forty tons a day.

The *Tribune* announces that in the Mercur mine the third of the auriferous ore chutes has been encountered, and what was long cherished by Manager Dern as a theory has crystallized as an absolute condition. His contention was that nature had not created two strata with an intercurring stratum of limestone. The confidence he had in the theory that a third stratum of ore would be encountered made him drive a winze 90 feet through limestone to chute No. 3, 300 feet below the surface on a perpendicular line. With the discovery of a third ore chute in the Mercur the company practically adds a new mine to its possessions. Concerning the values of the ore, nothing definite has been learned at the offices of the company, but the assumption is reasonable that they are at least as good as those that exist in chute No. 2.

About two weeks ago, at a depth of 300 feet in the Gladstone, at Mercur, water made its appearance in the shaft. It continued to increase in volume as depth was attained. Recognizing the commercial value of the water, says the *Tribune*, Manager Cory, who was then paying tribute to the water company, began to provide means for utilizing it, and it was made to supply the needs of the machinery. It continued to increase in volume, however, until pumps were necessary that the search for gold might continue. Pumps were thereupon put in and the sinking of the shaft went ahead. On Saturday last, says Col. Heffron, a shot was put off that carried them through the shale and into an altered limestone resembling that found in the older diggings of the camp. It was declared by some to be the vein. Col. Heffron views it as the capping to the vein. This change was not of so much importance, however, as the change which unbridled a small-sized Niagara 320 feet below the collar of the shaft, the water coming in with a hiss and roar that drove the miners momentarily to the surface. The stroke of the pumps was increased, a measurement of the water was made, and it developed that 40,000 gallons a day were coming in, an analysis made when the water first made its appearance in the shaft showing it to be fit for all purposes, domestic included. With a flow of 40,000 gallons a day, the domestic requirements of Mercur could be supplied, says Col. Heffron, while solution could be provided for 800 tons of ore daily. Basing his calculations on the present prices of water in Mercur, he estimates that the flow in the Gladstone can be made to earn nearly $100 a day at an expense of $10, and says the company will at once take steps to pipe the water into the market. It should, he adds, be made to earn at least $20,000 a year. Meanwhile the change which occurred in the rock when the big flow was encountered is being inquired into, and samples of it are now in the furnace

Bulletins obtained by the Salt Lake *Tribune* from the freight departments of the Oregon Short Line and Rio Grande Western Railway show that during the month of October there was handled by them ores and bullion as follows:

	Pounds.
Germania, Hanauer and Mingo bullion	6,861,103
Copper bullion	46,436
Pascoe slag	24,000
Ores	8,705,555

In addition to the items on which a check is kept in the freight departments, over 5000 pounds of cyanides of gold were expressed through the sampling rooms of the Consolidated Kansas City Smelting & Refining Company. In the production of this lot of cyanides it would be difficult to arrive at an intelligent estimate of the amount of crude ore that was required. It is known that the Mercur is handling 300 tons daily, the Geyser-Marion 150 tons, the Sacramento 100 tons, the Northern Light over 100 tons and other plants according to their tankage and crushing capacity. To compute the valuation of the cyanides is also difficult, the product varying, according to records kept by the various companies whose output is marketed in that form, from $6 to $38 per pound, this being governed very largely by the work of which the mill is capable, the character of the ore and the effectiveness with which the mass is handled. To reach a basis of calculation the controls on the last twelve lots that have been shipped were taken. Some of these lots ran very high, but the average for the dozen was $17.08 a pound, or a total of $85,400 which passed through the sampler at this point.

Bingham, in the matter of tonnage, led all all other camps, with Tintic next.

Park City *Record*: J. J. Daly superintendent Daly-West mill says: "Neither the mine nor mill will start so long as silver and lead do not advance. We have no thought of doing anything at present. I would like to be able to make a statement that would carry encouragement to the idle men in this camp, but until silver advances to a figure that will allow the mine to be worked at a profit, nothing will be done. The work on the mill is completed and everything in good shape for handling the product when prices warranted."

Notwithstanding assertions that the Ontario mill would close down Nov. 1st, it is still running, and the *Record* is justified in saying that enough milling ore is either at the mill, or at the mine ready to haul down, to keep the mill running at its present capacity for two months yet.

IDAHO.

A gold strike is reported from a placer deposit near Elk City, where some Montana men recently made locations. It is stated that, after a brief run, a clean-up of $1700 had been made.

At Burke, after experimenting to ascertain the relative values of coal and wood as fuel the Tiger and Poorman Consolidated Mining Company has decided to use the former and mammoth coal bunkers are being built extending nearly the whole length of the boiler house to hold a supply to last several weeks.

Avalanche: November closes the company year at the Trade Dollar mines, the output will be over half a million of dollars. The payroll for October shows 142 names. The expenses for the present season have been unusually large, on account of installing machinery and development work by shaft. All chutes which have been in use for four years were also retimbered, necessitating, with new work, the use of 200,000 feet of lumber during the past six months. Sixteen hundred cords of wood have been laid in for winter at the mill. Coal is used for fuel at the compressor plant. The Trade Dollar smelting ore runs from $50,000 to $80,000 per carload.

Free Press: W. H. Hill is back from Warren, where he has been doing some mine surveying and engineering work for some of the companies operating there, and reports that the camp is very prosperous and shipping bullion at the rate of $11,000 per month. The mill on the Goodenough is running steadily and giving results beyond expectations, and the big dredge outfits have also made some great cleanups.

MONTANA.

A quartz strike is reported on Gage creek near Utica, in the Ferguson country, and has "set the whole eastern part of the State wild. The rock runs over $100 to the ton."

On Grasshopper creek the work of the three dredging boats which are operating successfully on the old diggings will soon be supplemented with that of another of larger capacity than either of those now in operation. The three which are working are the F. L. Graves, which is running at Bannack by electric power; the A. E. Gaeter, operating at Marysville, one mile below, with steam as motive power, and the Maggie Gibson, also a steam machine, which is excavating on Jimmy's Bar, still another mile or so below. The fourth will be set up at the mouth of the canyon, four miles below Bannack, and will also be run by steam.

A working interest in the mine and mill of the McCauley Company of Crevasse has been bought by Clark & Westbrook of New York City. The terms of the sale provide for the payment of $20,000—$6000 Dec. 4, '97, $4000 March 15, '98, and the balance on or before August 1, '98. The working lease provides for immediate possession of the mine and mill, consisting of thirty stamps, and this will be put in operation at once for a testing run on the ores from the mine. Mr. Jones, as representative of the purchasers, has secured water rights and mill site near the mouth of Bear creek, at which point it is proposed to erect mills with a capacity of 100 stamps, and to which ores from the mines will be conveyed by a tramway to be erected, if the test is satisfactory.

Last Saturday, H. N. Blake, Master in Chancery at Phillipsburg, Granite county, sold all the property of the Golden Scepter Mining Company at Quigley, including 100-stamp mill, electric tramway, water rights and townsite, to J. A. Keyes, of Missoula, as trustee for the Reorganization Committee, for $549,529. The property will be operated by a new company recently incorporated, composed principally of creditors of the old corporation. Grover Cleveland, William G. Whitney and ex-United States Senator Higgins, of Delaware, were interested in the old company.

Inter-Mountain: The big St. Lawrence engine, which was installed a few weeks ago, was started up last week and it is said works very satisfactorily. A new six-drill air compressor of the Rand pattern is at the Little Mina mine upon which the Parrot Company began work a few weeks ago. The shaft will be developed from the 400 level to a much greater depth.

SOUTH DAKOTA.

The report of the Surveyor General of South Dakota, recently made to the Secretary of the Interior, says that no surveys were made in that State during the year. The Surveyor General devotes considerable space to the urgent need for the survey of the Black Hills, where mineral locations are being made rapidly. He says there is great need for an examination of the mineral surveys in the State and for connecting mineral monuments with regular surveys. He urges an increase in the allotment for surveys on this account.

COLORADO.

The Dives-Pelican at Silver Plume probably employs more men than any silver mine in northern Colorado. They number about 265, of which 225 are lease holders. The others are contractors and men on day's wages.

The Emma, noted for years past as the richest gold producer in Dolores county, has been sold to a Boston syndicate for $150,000.

The Smuggler-Union mill, at Telluride, is being enlarged to 230 tons daily, and the capacity of the tramway increased one-third. The Japan mine is producing two cars of concentrates daily from its mill, said to run $100 a ton. In addition, two or three cars a week of smelting ore are shipped.

Colorado Springs *Telegraph*: The output for October passed the million-dollar mark, an increase of over $100,000 over the month of September and swelling the approximate output for the present year to nearly $10,500,000, with every prospect of increasing the total to $15,000,000 with the closing day of 1897.

The actual figures direct from the management of the various treatment processes engaged in the handling of Cripple Creek ores places the gross tonnage for the month of October at 20,821 tons, with a bullion value of $1,095,366.36, as against 26,161 tons in September, of a value of $966,464.51, an increase of 3660 tons and $128,900.85.

The increase is clearly traceable to the additional capacity of the mills for the treating of ores, the chlorination and cyanide plants alone handling 3658 tons more than in the preceding month; the smelting grades show an increase, while the stamp mill treatment has been reduced.

In November, with the Gillett reduction works' improvements and additions completed, the capacity of the plant will be increased from forty tons to seventy tons daily, and the Kilton Ore Purchasing Company, whose large works at Goldfield, with a daily capacity of 400 tons and storage bins for 800 tons, start up on Monday, will be in the market for ore, increased treatment facilities will be added, and with the present daily increasing output of higher grade mineral the production for the month of November should not fall short of $1,500,000.

Following are the figures obtained from the chlorination, and cyanide plants handling Cripple Creek ores:

Brodie mill, at Mound City, cyanide process, 3048 tons of an average value of $24.82. Total value, $75,651.36.

Colorado Ore Sampling and Reduction Company, at Arequa, cyanide and chlorination, treated 1073 tons of an average value of $23.50; total $25,215.

The Gillett reduction works at Gillett, which have been busily engaged increasing their capacity, chlorination, 1100 tons of $35 ore, with a value of $38,500.

The El Paso reduction works at Florence, chlorination, doubled their treatment during the month, treating 2800 tons, as against 1400 in September, of an average value of $27; total $75,600.

The Metallic Extraction Company, also at Florence, a cyanide plant, handled 8000 tons, 2000 more than the preceding month, but owing to a large tonnage of dump ore the average value was reduced to $22 a ton, making a total of $176,000.

The Colorado-Philadelphia Reduction Company at Colorado City, chlorination, treated 4800 tons of $28 ore with a bullion value of $134,000.

The s amp mills of the district, running light during the month, were responsible for 1000 tons of an average value of $10 to the ton, or $10,000 for this grade of ore. Smelting ore, as aforesaid, shows a remarkable increase, mainly from the heavy producers, and from old mines like the Moose, Zenobia, and others that are once more ranking with the best in the camp. Eight thousand tons of smelting ore were handled between the two roads giving egress from the camp of an average value of $70 to the ton, or $560,000 for that grade of ore.

Summarized, the output as treated is as follows:

	Tons.	*Aver.*	*Amount.*
Smelters	8,000	$70 00	$ 560,000 00
Reduction works	20 821	25 23	525,366 30
Stamp mills	1,000	10 00	10,000 00
Total	29,821		$1,995,366 36

NEW MEXICO.

The Santa Fe *New Mexican* reports the probable sale by O. P. Posey and W. Cartan of Denver of the Albemarle group of mines in the Cochiti district for $240,000. If the sale goes through, a cyanide mill of 400 tons capacity daily will be erected.

ARIZONA.

Lewis Williams, of the Copper Queen Mining Company, Bisbee, writes that "the Grand Lodge F. & A. M. of Arizona, will meet here on the 9th, 10th and 11th of November. They will hold their sessions in the cave 500 feet below the surface of the earth. It will present a novel and beautiful sight. Electrical lights will be arranged in groups amongst the stalactites in the roof and sides."

The longest application for mining patents ever made has been received at the Prescott land office. It covers seventy mining claims and millsites in Mohave county, owned by D. H. Moffatt. The law allows the register of the land office a fee of $10 for each application filed, so that the applicant, in this case, makes a saving of almost $700 by grouping all the claims in one application.

The only native copper discovered in northern Arizona comes from the Buster mine, in the Bradshaw mountains. The native copper is taken from the ground in solid nuggets and leaf-like sheets, the latter from 4 to 6 inches wide, from 6 to 14 inches in length, and from the thickness of a knife-blade to one-quarter of an inch. These leaf-like layers run in veins through seams in the ore, which is more in the nature of a deposit than a vein, and crops out on top of the mountain. A tunnel driven in the side of the mountain 350 feet below the apex struck the ledge, and it is from this tunnel that the richest specimens come. Another tunnel will be run in 700 feet lower down, and if the deposit is struck at that point a smelter will be erected.

C. M. Smith, superintendent Mohawk Mining Co., reports that the Mohawk is running thirty stamps to their full capacity.

Correspondence *Republican*: Yuma is the supply depot for the Mesquite district, seven miles south of the thirty-five mile point west of Yuma on the S. P. The Bay Horse gold mine is operated by Los Angeles parties, L. A. Morlan superintendent. Twenty men are working. A dry roller mill is working at the mine.

Nearly eight miles southeast of Yuma, and fifteen miles southeast of Blaisdell station is the La Fortuna Gold Mining and Milling Company, which has been operating two years. The company has cleaned up from $35 to $96 per ton. A 20-stamp mill is run. One hundred and fifty men are employed. C. D. Lane is owner, F. J. Martin superintendent. The postoffice is Fortuna. A number of shafts are down, one 550 feet. But few men are employed at present. Big profits are made monthly by the owners. The output is a very complete one. Large ledges are apparent, a good body having been opened recently. Drifts will be made at once.

Six miles north of Ogilby, seventeen miles west of Yuma, is the Gold Rock. One of the biggest mills in the southwest is to be operated. Two hundred and fifty men are employed.

Probably 500 men, many of whom are Mexicans and Indians, have been placer mining north of and near Yuma, but no figures have been made as to the monthly pick-up. These operators sell the gold in large and small quantities in Yuma.

MEXICO.

There are two different formations in Mexico. In the eastern part of the State of Chihuahua is the lime and prophyry contact formation, the ores being carbonates carrying an excess of iron, about 15 per cent lead and 15 ounces silver. Sometimes the excess of iron increases at the expense of the silver, but the percentage of lead varies very little. This is the great smelting region, this character of ore being necessary for smelting purposes, and has caused the erection of the smelting plants throughout this part of the republic. Along the crest of the Sierras from the northern boundary to the Guatemalan frontier is a continuous succession of mineral veins, strong fissures, with granite walls, the ore being sulphides, and it is here that there is the greatest opportunity for American enterprise. The Mexicans are fair miners, but they have not the crudest idea of concentration and know nothing whatever about milling. In this belt of sulphide ores, the values are in both gold and silver. The idea has been very general that because Mexico has in the past produced great quantities of silver it is a silver country, but this is very far from the truth. Eventually Mexico will become one of the great gold producers of the world. In the northern part of the republic the metallic values of these sulphide ores run about 25 per cent in gold, but farther south gold forms about 75 per cent of the metallic values, and the ore is so refractory that even the patio system is ineffective in extracting the values. All of this vast belt of sulphides is practically virgin ground ready for intelligent, modern methods of operation. In Chihuahua there are twelve large milling plants in operation, and a greater or less number in Sonora, but south of Chihuahua there is not a single mill and the natives do not seem to understand how to take advantage of the mill system. Regarding the wealth of these deposits of sulphides, one instance will give some idea. A mine in the southern part of the republic has to pay such heavy freight rates and such high smelting charges that nothing less than $100 ore can be shipped, and yet this mine is shipping ten carloads of ore per week. The amount of sorting necessary and the quantity of second and third-class ore lying on the dump that could be utilized by concentration can be imagined. It is in the southern part of the republic that the greatest rewards await American enterprise in the establishment of mills. Another thing to be considered is the question of transportation as it exists all over the republic. The railroads all run on the elevated plateau at a distance of from 100 to 200 miles from the mountains, necessitating wagon or burro transportation for that distance, so that it is practically impossible to ship anything except bullion from the mines. It is equally impossible to ship in heavy machinery for any distance over 100 miles, and it becomes important to devise methods of treatment which require the lightest machinery possible, and any system which can reduce the ores to oxide and put them in condition for amalgamation will find an open field in Mexico, with profits beyond anything that they can hope for in this country, for it costs a great deal more to treat ores in Mexico than in the United States. Eventually concentrating plants will be established all along the Sierras, but the best field now is for such processes of preparing the ore for amalgamation, as can be erected without serious expense, and of course that means light machinery. It is to be regretted that the United States does not secure more of the Mexican trade, which is mainly in the hands of the Germans, but the Americans do not seem to get hold as the Germans do. American goods are vastly superior to German manufactures, but the latter sell and seem to defy competition. One thing that operates against Americans is the customs system of the country. One duty is levied on the gross weight of the package and the other on its contents. The Germans import everything in bales and the Americans in boxes, which makes a very material difference in the amount of duty paid. But in mining and milling appliances the United States beats the world, and in Mexico is a ripe field awaiting American energy and enterprise.

CENTRAL AMERICA.

The schooner Vine is billed to leave this city to-day with an expedition to look for gold in Central America. The Spanish-American Developing & Mining Company say they have concessions from San Salvador, Costa Rica and Guatemala for 6000 acres of territory which lies at the points of contact of the countries, covering the mineral development of the tracts. The claim is made that the company has a capital stock of $2,000,000, with one-half of it paid up. The stock of the company is owned, according to the statements of W. Aumock, in Cleveland, Ohio, and England.

SOUTH AFRICA.

A Washington, D. C., dispatch says reliable information has been received by officials of the United States Geological Survey to the effect that great diamond mines had been discovered in the Transvaal country that from surface indications will prove fully as rich as the famous Kimberley mines. A powerful syndicate, of which Cecil Rhodes is the head, is now negotiating for the purchase of the property. Ever since the discovery of the Kimberley mines the search for new diamond mines has been in progress, but, until the

Transvaal discovery was made, without success. The geological formation at Kimberley is peculiar, and similar formation could not be found. The search has been continued unsuccessfully for so many years that the announcement now of a discovery of great richness comes as a surprise.

The reports of the Witwatersrand Chamber of Mines and the Association of Mines give the product of the Rand district, South Africa, for August as £908,681. The stamp mills treated 449,511 tons, each stamp averaging 4 5 tons per twenty-four hours. The number of stamps running was 3560. There are about 6000 now in operation in California.

NEW ZEALAND.

The export of gold from New Zealand during the quarter ending September amounted to 60,220 ounces, of the value of £232,743, as against 76,051 ounces of the value of £302,974 for the corresponding quarter of 1896.

The Yukon District.

Dr. Sidebotham writes from Rampart City that he is about 300 miles below Fort Yukon and a few miles above Tanana; distances are very vague. In order to hold a staked claim it is necessary to do assessment work, which consists of $200 worth of work, and as labor is valued at $10 a day, that means twenty days of work, which must be done between January and May for winter diggings, and April and August for summer. The former are thawed out as you descend, the latter sluiced out on the bar when the creeks commence flowing. There are good wild cranberries there, which go on ripening under the snow. A tuft of rabbit skin protects the nose from freezing. The miners have to make their own laws, which are very strict. Any one caught stealing is hanged first and tried afterward, and there are no appeal courts. It is hard to get the Indians to do anything; "they are the most maddening and independent creatures I ever met with, also most extortionate." Rampart City is a boom town, with values much inflated. Claims are going up in value constantly. Three have been sold for $5000 each and several half interests for from $2000 to $3000.

Juneau *Record:* Those who intended to reach the diggings on the Klondike by the St. Michael and up-river route made a great mistake, and those who intend to sail from below early next spring by the same route will make the same mistake. The only practicable spring route to Dawson City is via Juneau and over one of the passes to the lakes.

On the Yukon, as on every other river that freezes, it is easy to trace the deep water in winter time by watching the ice. In the places where the water is only 5 or 6 feet deep the river freezes solid, and the ice remains on a level; but in the deeper places the ice will sag down something like a segment of a circle, and when the tide comes in this portion of the frozen river will be covered. In the spring, when the ice breaks up, the cakes in the current will float out to sea, while those in the shallow places will become stranded. Continued observations extending over a number of years has convinced Father Barnum, missionary at St. Michael, that the Yukon is navigable to ocean vessels for a distance of at least 600 miles from the mouth. The Yukon is sixty miles wide at the mouth, and it is quite evident that there is a channel on the south side deep enough to float the largest ship.

Increased Threefold.

The present mining activity is illustrated by a statement by S. J. Hendy, which is typical of the reports by all established manufacturers and dealers in mining machinery in San Francisco. Mr. Hendy says that the business in this line now being done is three times as great as a year ago. Seven-eighths of the number of orders are for development machinery, which is highly significant of what is going on all over the State in the way of opening up mines. Small stamp mills, hoists, boilers, engines, water wheels, etc., innumerable are being shipped from the city constantly. The demand for material for hydraulic plants shows a very great increase.—Colfax, Cal., Sentinel.

Amendment of Federal Mining Law.

TO THE EDITOR:—In your issue of 30th ult. Mr. Keyes makes some strictures on my notes on Federal mining law amendment in an earlier number. Disclaiming any desire to prolong a controversy, I would yet ask a little space for explanation.

It is very possible that, as he says, I am misinformed as to the occurrence of the Lake copper deposits, but as this information was gained in my daily tramps through the workings for a number of months, I have only myself to blame for any errors. 'Tis true I never tested experimentally the relative applicability of the square claim, or the law of the apex, to these bodies (Mr. Keyes should know they are not locally called "lodes") by his method of subterranean artillery practice, nor do I yet quite understand what his cannon-ball story is expected to prove. The point I was trying to make clear was that on large bodies of mineral-bearing rock, extending over large areas and lying at but slight angle with the horizon, the square claim or acreage basis was less objectionable than when applied to what we term lodes, with a much steeper dip.

In those bodies the owner lower down on the dip is at but a relatively slight disadvantage.

Mr. Keyes proves (?) his assertion that "the ability to purchase large tracts does not tend to concentrate property" by citing the Quincy Company at the Lake, which owns 10,000 acres, and that, too, of land so poor that, to quote his authority, "they would gladly sell the land for less than the taxes levied on it." The choice of the illustration seems to have been an unfortunate one and it would be interesting to learn just what is Mr. Keyes' idea of "concentration," and to speculate on about how much land the managers of Quincy would have accumulated had it been worth the taxes.

With the rest of his letter I have no quarrel. He merely cites several dissenting opinions and it is no news to any of us that we are not all agreed upon this point. He quotes a delegate to the San Francisco convention as saying that there are "vast numbers of locations in his district which have been held for more than twenty years with not a stroke of work done on them since the original location," and a delegate to the Denver meeting as saying "whole districts have been held for years in my neighborhood without any work." Then these delegates folded their hands and said "some means ought to be found to make these men work or let go." Did it ever occur to him or to them that the annual representation law they are seeking to repeal not only provides those "means" for which they sigh, but that under its provisions the "let go" occurred some eighteen years ago—only these delegates have not found out about it yet. It is probably too much to expect that people who let "whole neighborhoods" and "vast numbers of locations" lie unrepresented for a generation will, in a short space of two decades, catch on to the fact that the ground has become jumpable.

Speculation as to the value of those districts would be unkind. If it was not a case of mighty poor quartz, then either they are a sleepy people up there or their delegates were, in the vernacular, talking through their hat. There is no excuse for demanding new laws so long as they fail to use the means already provided to their hands by the existing statutes. Our laws are not so very bad when they are lived up to, and we should at least exhaust the remedies they provide before we venture to condemn them as inefficient. The blame for the abuses of non-representation and perjured proofs of labor lies not in the law that penalizes such things, but in the sentiment of the community which knowingly tolerates them. R.

November 8th, '97.

Recently Declared Mining Dividends.

Morning Star, Placer Co, Cal., $6 per share; payable Nov. 1.

Le Roi, B. C., M. Co., $50,000; payable Nov. 10—a total to date of $675,000.

Hall Mines, B. C., 7 cents on preferred stock; payable Nov. 15.

Portland G. M. Co., Colorado, 1 cent per share, $30,000; payable Nov. 15.

Anchoria-Leland M. & M. Co., Colorado, 1 cent per share, $6000; payable Nov. 15.

Broken Hill Proprietary Block 10 Co, Limited, Australia, No. 55, 75 cents per share; payable Nov. 17.

Silver King, Utah, $37,500—a total of $1,275,000; payable Nov. 10.

Swansea, Utah, 5 cents per share, $5000; payable Nov. 11.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 2, 1897.

593,040.—CLOD PULVERIZER—Adel & Leib, San Jose, Cal.
593,159.—GATE LOCK—C. B. Johnson, Los Angeles, Cal.
592,786.—AWNING SUPPORT—W. Johnson, Mott, Cal.
593,183.—CAR COUPLING—J. J. Malloy, Portland, Or.
572,873.—SASH FASTENER—E. E. Masters, Sacramento, Cal.
592,994.—REIN HOLDER—W. C Nelson, Santa Rosa, Cal.
593,028.—FILE OR RASP—O. Olson, Redding, Cal.
592,882.—FIRE LIGHTER—W. S. Overlin, Portland, Or.
593,036.—PHOTOGRAPHIC MOUNT—P. J. Stuparich, S. F.
592,945.—CAN OPENER—J. E. Youngblood, Union City, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PHOTOGRAPHIC MOUNT.—Paul J. Stuparich, San Francisco, Cal. No. 593,036. Dated Nov. 2, 1896. This invention relates to photographic card mounts, art panels, and analogous articles, and a process for producing the same. In this art it is common to make photographic card mounts and similar art panels, with a tinted surface, and afterwards applying to such tinted surface letters or words giving the name and address of the user of the card in a different color. This has usually been done in two operations, first, consisting of tinting the card, and the other, in applying upon the tinted surface the tinted letters or other matter in French chalk or any substance which can be used for the purpose. In this invention the desired tint is applied to certain parts of a white-surfaced card and simultaneously the other portions of the card are raised directly above the surface without applying the tint, the whole being done in a single operation.

CLOD PULVERIZER.—W. T. Adel, San Jose, Cal. No. 593,040. Dated Nov. 2, 1897. This invention relates to a machine which is especially designed for the crushing and pulverizing of clods of earth. It consists essentially in the novel construction of a roller or rollers mounted upon a shaft, with a means for propelling the apparatus over the ground. The object of the device is to pulverize the hardened clods which are formed by drying after wet soil has been plowed. These clods accumulate in large quantities on adobe or clayey soil, and it is difficult to break them sufficiently to make the land valuable for use. The rollers consist of heads forming each end, one or more being mounted to turn in line with each other upon a single shaft. The heads or disks have continuous annular channels made near the peripheries and bars are fitted into the channels with ribs which abut against the disks and bolts extending from one head to the other are provided with nuts whereby the heads may be drawn together to lock the bars in place and form the roller surface. A suitable weight-carrying box and driver's seat are supported directly from the axle so that any desired pressure or weight can be brought upon the apparatus. The steel T-shaped bars form a very satisfactory crushing device and very easily removed and replaced by loosening the nuts upon the binding bolts.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Navigation, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application.

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

MINE SUPERINTENDENT required who is thoroughly practical and experienced in Hydraulic, Drift and Quartz Mining and Milling. Apply, with references, to PACIFIC EXPLORATION CO., 29-30 Chronicle Building, San Francisco.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice

611 and 613 Front St., San Francisco, Cal.

Coast Industrial Notes.

—The Tahoe, Cal., Lumber and Flume Company got out 8,000,000 feet of lumber and 15,000 cords of wood this season.

—The Alcatraz Asphalt Company is putting $2,000,000 in improvements and development work in Santa Barbara county, Cal.

—Salmon are becoming scarce in Alaskan waters, and unless hatcheries are immediately established the species may soon be extinct.

—The Butte County, Cal., Electric Light & Power Company has elected directors: R. A. Friedrich, S. J. Hendy, O. T. Weber, J. Simonson, R. White.

—The Safford Milling Company has an estimate of the grain raised in the Gila valley, Arizona, this year, 5,300,000 pounds of wheat and 2,600,000 pounds of barley. Wheat is now selling at $1.25 per cental and barley at $1.

—The Bisbee, Arizona, *Lyre* reports that W. C. Land shipped 1300 head of cattle to Bakersfield, Cal., last week, drove over the trail 1000 head to the Animas valley in New Mexico, and will start 800 head more to that valley.

—Last Tuesday 31,141 barrels of flour, 1000 tons railroad rails, 400 kegs spikes and 75 kegs bolts were shipped to China and Japan from Portland, Or. The cargo was valued at $150,000. The railroad materials are for Chemulco, Corea.

—The San Francisco *Call* claims to have information that the equipment and operation of the Market Street Railway Company's system with compressed air power is now only a question of time, and that the new system will entirely supplant the use of electricity and cable on Market street.

—The improvement of Humboldt bar, at Eureka, Cal., has cost the Government $1,199,115 since the present contractor began active operations in the summer of 1893. The amount of rock dumped since then is 715,396 long tons. There is now from 22 to 28 feet of water on the bar, where the depth before the improvement commenced was from 9 to 14 feet.

—The Northern Pacific increase for three months over the same months last year is $950,000. The gross earnings from July 1 to October 1 are $6,179,760, and the operating expenses $3,233,448, leaving the net earnings $2,946,292. The gross earnings in September were $2,510,839, and the operating expenses $1,094,855, leaving the net earnings for the month $1,415,983.

—More than 200 wells resumed pumping operations in Los Angeles, Cal., on the morning of the 1st inst., after having remained closed down for two weeks. During this time the Los Angeles field has been emptied of 40,000 barrels of surplus oil, and the managers of the Oil Producers' Trustees express the opinion that another shutdown will not be necessary to maintain a dollar-a-barrel market.

—The first engine using crude oil as fuel arrived in Yuma, Arizona, last week. The engine consumed 238 gallons of oil in making the trip from Indio there, which cost a little more than half as much as coal required for the same service. The tank for storing oil here is now complete, and as soon as the necessary change in machinery can be made all engines running between Yuma and Los Angeles will burn oil instead of coal.

—The Yukon Company of Seattle, Wash., has a contract with the Roach Shipbuilding Company at Chester, Pa., for two 5000-ton steamships to ply between Seattle and St. Michaels, to connect with Yukon river steamers. The two ships are to be each 418 feet long, 48 feet beam and 27 feet deep, with a carrying capacity of 4200 tons and 1000 passengers. The ships are designed to make a speed of sixteen knots an hour. They will cost $1,000,000.

—The Mexican *Herald* reports that H. J. Langdon, who has just arrived in Mexico City from a trip to the Isthmus of Tehuantepec, is the representative of a company that has been formed in San Francisco to buy and work a coffee, sugar and rubber ranch in the tierra caliente. Owing to the situation of the country, between the Atlantic and the Pacific oceans, there is no really dry season, for even in the dryest season a little rain often falls.

—Japan is importing cheap labor from Korea, to work in her coal mines. Five years ago the wages of carpenters were 33 cents a day. Now they advertise that their wages have risen to 80 cents a day. The cost of living has nearly doubled in five years, and the cost of labor has risen in proportion. Rice, in 1890, was $4.90 a koku; to-day it is $8 90 to $9 10. The bogie of Japanese cheap labor, which many writers are so fond of calling up from the vasty depths of the unknown East, is as illusory as any other phantom.

—Eureka, Cal., has a proposition from T. S. Bullock and his associates, who built the Sierra railroad into the mines from Oakdale, to build a railroad about 150 miles long from Eureka to Grants Pass, in Josephine county, Or. Eighty miles of the road would pass redwood. Bullock and his associates ask for rights of way and terminal grounds, purchasers for $375,000 of their first mortgage bonds, limited to $20,000 per mile, and payable in installments of $75,000 on completion of each ten miles of the road until the amount is paid.

—A proposition has been submitted by the Oxnards to the people of Ventura county, Cal., to erect a beet-sugar factory to cost $2,000,000, in that county, with a capacity of 2000 tons of beets per day, to be ready for operation by July 1, 1898, on condition that they shall be given 100 acres of land for a factory site, and right of way from the Southern Pacific railway for a spur to the factory, and that the growers will pledge 20,000 acres of land to beets for five years. For the beets grown the Oxnards agree to pay $3.25 per ton for beets of 12 per cent sugar, and 25 cents per ton for each per cent of saccharine matter above that, and at the end of five years they reserve the option of contracting for the 20,000 another two years at $3.60 a ton for 12 per cent beets, with 24 cents per ton for each per cent over that. The Oxnards propose to spend $1,000,000 upon the factory the first year, and will get the plant in shape to handle 1000 tons of next season's beets per day, doubling the plant and its capacity the succeeding year.

—It is expected that by Aug. 1st, '98, a telegraph line will be in working order to Dawson City. The Canadian Government is to build the line at an expense of $400,000. It will start from Ashcroft, a point on the Canadian Pacific railroad 200 miles east of Vancouver, and go via Quesnelle to Dawson. The length of the line will be about 1400 miles, and it will be operated as part of the service of the Canadian Pacific Telegraph Company. It is at Ashcroft that the company's line will connect with the proposed telegraphic service to the Klondike country. Later on branch lines will be run to Juneau and Sitka.

—Under date of Nov. 6th our Vancouver, B. C., correspondent writes: "The Hon. Clifford Sefton, M. P., Minister of the Interior, just returned from the Yukon country, has been lecturing before public bodies in the Province. He warns coast cities that unless goods are properly packed and there are plenty to supply the demand, irreparable harm will be done the Province. Mr. Sefton's remarks have spurred wholesalers to action. All the goods that can possibly be stored are being ordered. An agent of Cook, the excursion manager, has arranged for 4000 beds in Vancouver and 4000 in Victoria to date."

Personal.

MR. DOERR is at Everett, Wash., to install an arsenic plant at the smelter.

W. A. CLARK of Montana is examining copper properties near Hermosillo, Mexico.

D. B. HUNTLEY has returned to De Lamar, Idaho, from a trip through Utah and Montana.

BEN STANLEY REVETT is in San Francisco en route to Colorado to examine mining property.

HERBERT LANG is about to build a smelter at Minneola, twenty miles east of Barstow, Cal.

W. C. RALSTON is in Boston arranging for operating the Melones mine in Calaveras county, Cal.

C. E. UREN of Grass Valley, Cal., has accepted the superintendency of the Allison Ranch mine.

THOS. COUCH, formerly of Butte and Mariposa, Cal., is now interested in dredging operations near Oroville, Cal.

W. T. MENDENHALL, consulting engineer of the California Gold Mines Association, is examining mines at Maybert, Nevada Co., Cal.

C. H. HAND of Butte, Mont., will superintend the operations of the dredge of the Western Mine Enterprise Company at Oroville, Cal.

V. G. BOGUE, formerly chief engineer of the U. P. R. Co., is in San Francisco, securing data regarding proposed electric power for the mines of Tintic, Utah.

D. A. BENDER, for many years with the V. & T. road, Nevada, is now the general manager of the S. F. & San Joaquin Coal Company, operating the Corral Hollow mines and the Alameda & San Joaquin Railroad.

C. M. ROLKER of London, who has bsen studying the Mercur, Utah, gold deposits, is in San Francisco and contemplates returning to England next week.

"JACK" MCQUESTEN, "the father of the Yukon," who came down from there recently, has sold in this city a claim on Minook creek for $50,000, and one on El Dorado creek for $150,000, and left for New York City this week to organize a mining company to work in Alaska next season.

EDWARD BOYCE, president Western Federation of Miners, has arrived here and says he will spend the winter in California, organizing. He thinks the western labor organizations should quit sending money to Eastern labor unions, which, he says, never help the Western organizations.

J. E. DOOLITTLE of Placer county; W. S. Keyes, T. B. Bishop, A. Morrison of San Francisco; J. F. Parks of Amador county have been appointed trustees of the State Mining Bureau. The trustees met on the 9th inst. and organized, electing Col. W. S. Keyes president and Mr. Thos. B. Bishop vice-president.

H. S. SHERARD, formerly superintendent Grand Victory mine, El Dorado Co., Cal., has returned from Dawson City via St. Michaels. He is credited with possession of $192,000. He located claim 7 on El Dorado creek. A few weeks ago, he states, he sold it to Henry Bratnober, representing the London Exploration Company, for $175,000, of which amount $71,000 was paid down and the remainder is payable in six months. He brought down considerable gold dust, and at the Selby Smelting Works got $17,000 for it, the gold going $14 to the ounce. He also says: "Bratnober came to Dawson this past summer and bought eleven other claims besides mine on El Dorado creek. I was told the aggregate amount he paid for these claims was $2,200,000. He paid either $275,000 or $250,000 for one claim. He could not get claim 4 on El Dorado creek and offered $500,000 apiece for claims 1, 2 and 3 on the same creek. Their owners declined to sell for less than $1,000,000 each. The first four claims on El Dorado creek are phenomenally rich and their gold will run fully $16 to the ounce. Bratnober's twelve claims lie between claims 4 and 17." The authenticity of all these statements is in dispute and may be successfully contradicted.

HENRY S. PRITCHETT, the new superintendent of the Coast and Geodetic Survey, was five years in the Naval Observatory and for fifteen years has been connected with the Washington University. He is only forty years old and is the youngest man ever appointed to the head of the survey. He has been connected with the work of the Coast Survey and spent a year in Japan and China conducting experiments for determining the figure of the earth. Prof. Pritchett has received a number of scientific degrees from American institutions and holds the degree of doctor of philosophy from the University of Munich.

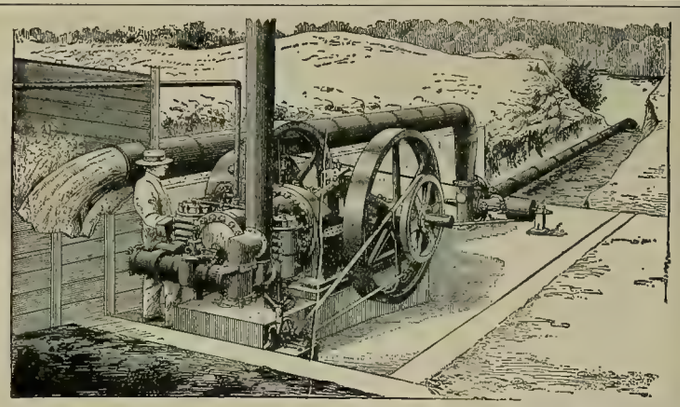
Commercial Paragraphs.

THE pipe-threading machine illustrated and described on page 460 is made and supplied by the Columbus Machine Works, 223 W. Broad St., Columbus, Ohio.

THE Edward P. Allis Co., Milwaukee, Wis., D. B. Hanson manager, 9 Fremont St., San Francisco, have an order from the Anaconda Copper Mining Company of Anaconda, Mont., for four 100x12 feet two-hearth Holthoff-Wethey calcining furnaces.

Recent California Mining Incorporations.

Sitka Mining Co., San Francisco; capital stock, $2,000,000, $5000 subscribed; F. Pauson, G. Gerst, J. W. Pauson, G. W. Hosmer, S. J. Hendy.



LARGEST GASOLINE PUMPING PLANT IN THE WORLD

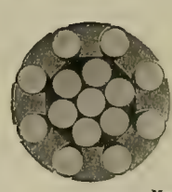
The illustration shows the gigantic pumping plant recently built by the Hercules Gas Engine Works on the Packer Ranch, Colusa Co. 80 h. p. Hercules Engine, pumping 7200 gallons a minute, 27 feet high. Burns Gasoline or Distillate oil. Cheapest power known. Gas, Gasoline and Oil Engines, 2 to 200 h. p. Send for Catalogue. HERCULES GAS ENGINE WORKS, 217 Bay St., San Francisco.

THE PATENTED

Locked-Coil Cables AND Webber Compression Grips

Are features of the patented BLEICHERT WIRE ROPE TRAMWAY And other systems of aerial transportation.

Bleichert Tramway of Old Dominion Copper Co., transporting ore.



Manufactured by

The Trenton Iron Co.,

TRENTON, N. J.

Engineers and Contractors, and sole licensees in North America for the Bleichert System. Also, Wire Rope Equipment for Surface and Underground Haulage, Etc.

FOR PARTICULARS, ADDRESS

NEWTON M. BELL, Agent, 109 California St., S. F.

☞ A full stock of the Trenton Iron Co.'s Wire Ropes, made from "SPECIAL" Crucible and Plough Steel, carried in San Francisco.

MINING MACHINERY, Second-hand.

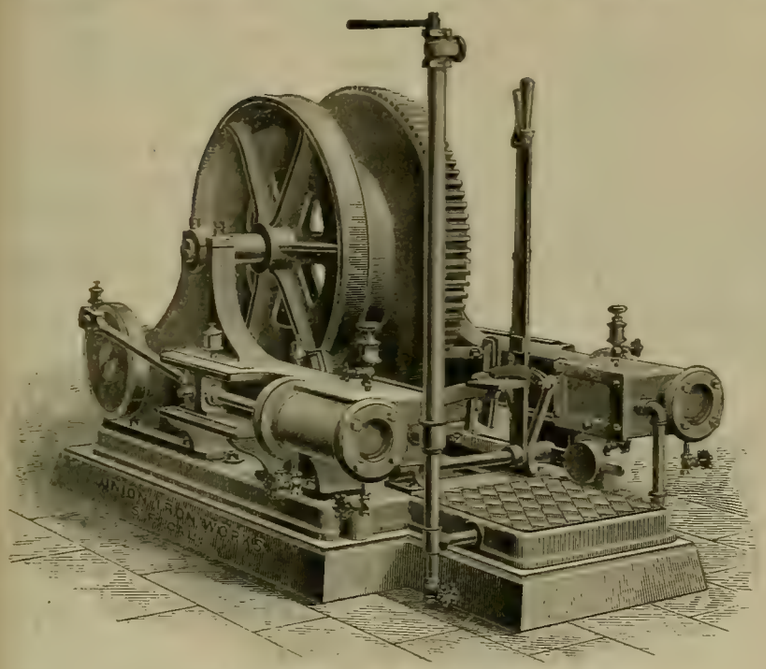
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

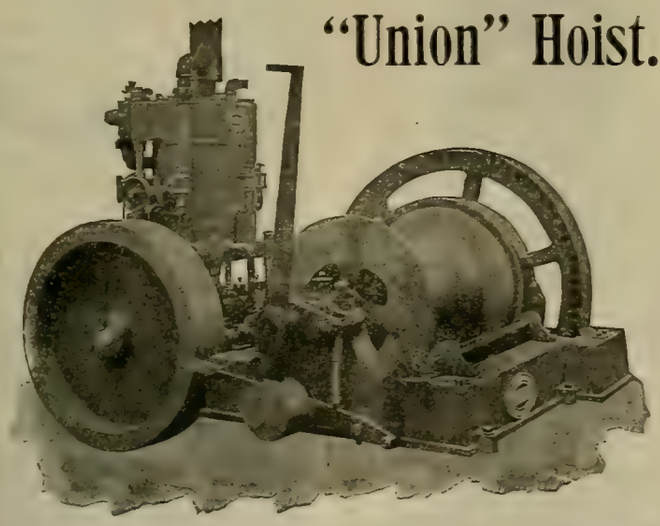
USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

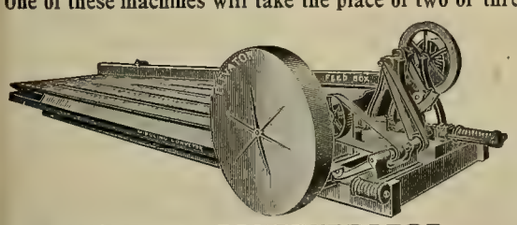
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

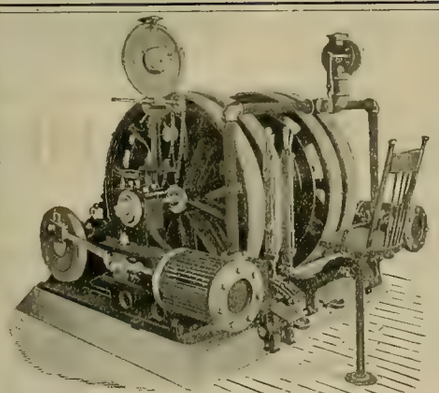
FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.



10 x 12 LIGHTNING QUADRUPLE FRICTION HOIST.

Whatever is popular deserves attention.—*Thackeray.*

Unquestionably the Most Popular Friction Hoist in the Market is the

Bolthoff Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

— HEADQUARTERS ON PACIFIC COAST FOR —

C. P. CYANIDE POTASSIUM (98-99 per cent.) Orders Solicited.

F. W. BRAUN & CO.,
Wholesale Druggists, Los Angeles, Cal.

THE MACHINERY & ELECTRICAL CO.,
Southern California and Arizona Agents for
Gates Iron Works Mining Machinery.
Stamp Mills, Ore Crushers, Ore Cars, Etc.
Tremain Steam Stamp Mills.
Oil City Boilers and Engines.
Snow Duplex Mine and Sinking Pumps.
Hercules Gasoline Stationary and Hoisting Engines.
Bates Corliss Engines. Ideal Automatic Engines.

Also Dealers and Jobbers in
Machinery and Electrical Supplies.
Shafting, Belting, Pulleys, Packing, Etc.
Incandescent Lamps, Samson, Edison, Leland Batteries.
Construction of Electric Light and Power Plants a Specialty.
Correspondence Invited.

351 and 353 N. Main St., Los Angeles, Cal.

The L. W. BLINN LUMBER CO.,
WHOLESALE AND RETAIL DEALERS
IN
Lumber, Shingles, Shakes, R. R. Ties, and Building Material of all kinds. ★

Main Office, 348 E. Second St.
LOS ANGELES, CAL.

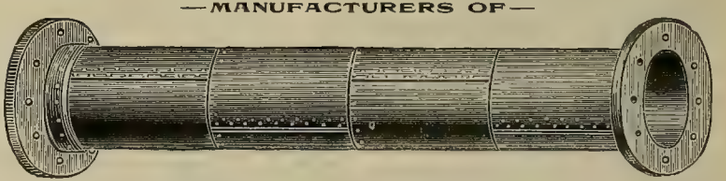
SPECIALTIES:
MINING TIMBER and Plank for Arizona and Mexico Shipment.
CORRESPONDENCE SOLICITED.

BAKER IRON WORKS,
950 to 956 BUENA VISTA STREET, LOS ANGELES, CAL.

Stamp Mills a Specialty (from two-stamp up). Hoisting Engines. Agents for Henry R. Worthington STEAM PUMPING MACHINERY and the ATLAS ENGINES AND BOILERS. General Foundry Work and all kinds of Heavy Forgings. Oil and Water Well Tools. Correspondence Solicited.

Manufacturers of MINING AND MILLING MACHINERY.

LACY MANUFACTURING CO.,
— MANUFACTURERS OF —



Steel Water Pipe for Hydraulic Mining and Irrigation.
WELL CASING.
Oil Tanks, and General Sheet Iron Work.
IRRIGATION SUPPLIES.
All Correspondence Will Receive Prompt Attention.
LOS ANGELES, CAL.
DEALERS IN CAST IRON PIPE.
OFFICE, ROOM 4, BAKER BLOCK.

RIVETED STEEL WATER PIPE.
THOMSON AND BOYLE PIPE CO., MANUFACTURERS.
310-314 REQUENA ST LOS ANGELES, CALIF.

Water Pipe for Placer, Hydraulic and Quartz Mining a Specialty. Made up complete, or cut, rolled and punched to be riveted at mine. Well Casing; Oil, Water and Cyanide Tanks; Galvanized Air Pipe; Ore Cars and Ore Buckets, and all kinds of Sheet Iron and Steel Work. Mail orders promptly attended to. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 11, 1897.

While business is reported quiet yet it shows a large increase over the like time in 1896 and on a much healthier basis. Then the retail distributive trade were largely in debt, but since then the weak firms have been weeded out and those continuing have either paid up in full or else are in easy circumstances. Traveling salesmen say that interior merchants are not carrying free stocks, which will necessitate buying to a greater extent this winter than heretofore. A tour among foundrymen and iron works in general reveals the fact that there is a confident feeling business with them in 1898 will be the largest and most prosperous year ever enjoyed by them.

The local money continues to work on easy lines with idle money in banks steadily increasing. The demand is very light with no improvement looked for this side of next spring. High prices for farm products and farmers large sellers have put merchants in easy position. So far as we can learn they are not in want of accommodations as the big majority have idle funds in bank. Exchange on New York is easy at a slight decline. The Eastern money markets are easy.

New York Silver Prices.

NEW YORK, Nov. 11.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26¾	56¾
Saturday	26½	57¼
Monday	26¾	57½
Tuesday	26¾	57⅞
Wednesday	26¾	57⅝
Thursday	26⅝	57⅝

	Copper.	Lead.	Iron.	Tin.
Fri.	10 80 @11 00	3 92½	10 00@12 25	13 65
Sat.	10 80 @11 10	3 90	10 00@12 25	13 65
Mon.	10 80 @11 00	3 85	10 00@12 25	13 67½
Tue.	10 80 @11 00	3 83¾	10 00@12 25	13 70
Wed.	10 80 @11 00	3 82½	10 00@12 25	13 70
Thur.	10 80 @11 00	3 82½	10 00@12 25	13 70

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.82½
London Sight Bankers	$4.86½
Refined Silver, per oz., 1000 fine	.57
Mexican Dollars nominal	.46

The steamer Peru for China took out treasure valued at $943,529, of which $802,929 were in Mexican dollars, $132,000 in silver bullion and $8600 in gold coin.

SILVER. — The market strengthened slightly, only to shade off towards the close. The ups and downs in prices show that silver is very sensitive to the least demand, which ought to indicate that it is in stock. Late advices from Russia state that it is in contemplation to retire paper money and coin silver to take its place. This is a good move, for that country can make by it owing to the low price of the white metal.

MEXICAN DOLLARS.—The shipments to the Orient are very large, but they do not have much effect on prices, as the supply appears to equal the demand.

COPPER.—The market has held steady throughout the week. The East reports a light call, with no improvement looked for this year. The export demand has also fallen off. This is due somewhat to the holiday season being near at hand, although India is said to be still drawing. The continent is taking fair quantities.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	—@16¼
Bolts, ¾ and 5-16, 20c; ¾ and larger,	16½

QUICKSILVER.—The market is steady. Exports the past week aggregate 100 flasks to Mexico.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is quiet and in buyers' favor both here and at the East.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

TIN. — The market is quiet, with some shading reported.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is easy, with some shading reported.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—There is a good demand, with the companies behind in deliveries, notwithstanding working overtime.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

IRON.—There is a steady tone to the market. The East reports a good demand at fairly steady prices.

NAILS. —The market is steady at full prices.

We quote the following basis: 20d to 60d inclusive, wire $2.45, cut $2.35.

COAL.—The market is practically unchanged. The efforts that are being made to break the combine have not, as yet, had any visible effect. Receipts of coal for the week were as follows in tons: Departure Bay, 5,050; Puget Sound, 18,711; Comox, 7,150; Coos Bay, 600; Newcastle, N. S. W., 5,465; Nanaimo, 10,708; North Shields, 1,102; Baltimore, 3,002. Total, 51,787.

COKE.—The market is steady, with a fair demand reported.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is firm.

Our market is quoted at 8½c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

BORAX.—The market is active, with free shipments being made to the East.

The market is quoted as follows:

Refined, in carload lots, in barrels	5½
Refined, in carload lots in sacks	5¼
Powdered, in car lots	5½
Concentrated, "	5

Chemicals.

Business is practically unchanged. The demand is slow from first hands, although it is said that stocks in second hands are running down. The New York market is reported by latest mail dates as follows: Nitrate soda was more freely offered, to arrive, at 1.60c, and rumor had it that business was effected at 1.57½c, if indeed not at a shade less. On other chemicals sellers quite generally repeated the prices that have been in force for several days, and nothing more than ordinary business was effected in any line.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steadier from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is only fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is easier.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is reported steady for spot but weak for shipment.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Nov. 11, 1897.

The market sold lower the past week under manipulations by a strong moneyed pool. This has been done largely through points of lower prices put out by the manipulator generally through tools. Of course the chipping brigade in both boards recognize the situation and generally sell the market down. At the declining prices margins are uncovered and considerable cash shares come out—thrown on the market by disgusted and nervous holders. It is a recognized fact that at the decline the manipulator succeeded in buying large lines of shares, particularly those booked for a deal when the general situation becomes more favorable. There is no question that the late skyrocket moves have been for the purpose of attracting the public from shares desired by the inside. Aside from this the very rapid declines in the shares which made the highest move were not down to sell, but to rake in everything in sight at the lower prices to which they were sent. The declines, combined with assessments, have done the work expected, viz., disgusted all outsiders. When prices were advancing the writer warned dealers that they were going up beyond the safety lines and that they would not be maintained. The end has proven the statement correct, but now prices have been forced to lower figures than the general situation in the mines justifies, and it is only a question of a short time before better figures rule for several than are now ruling on the two exchanges, yet if the manipulator sees his way clear he will get the market to slightly lower figures before starting in on the up grade. It is reported that when John W. Mackay was on the Comstock he suggested some work in the mines which report says the Mackay-Flood combination control. This probably explains why the shares in these mines have not done anything except go down under assessments. Occidental sold down the past week, selling at $1.05 yesterday, when it moved up to $1.70 in the afternoon. It is stated that there is a line of shorts on these shares, and it is only natural, when this occurs, an ore development is reported. This takes place in every mine whose shares are dealt in on the exchanges.

From the Comstock mines, the news continues unimportant, but this can be, and some day will be, changed so as to excite the cupidity of outsiders. There is no denying that the work in several mines which the public think is of consequence is developing them for future operations. Several levels continue to be blocked out which, in the due course of time, will show the wisdom of it, but it is not at all likely that when that time comes the assessment-ridden public will hold very few shares. In Utah the work is still westward, with nothing new reported. In Sierra Nevada west cross drift No. 4 got into very favorable formation, with the material encountered indicating that they were nearing an important point, when the work was stopped, as it was in the other cross drifts, and work resumed in the north lateral drift. When the latter is extended a sufficient distance, another cross drift will be started. In Union the work is the same as heretofore reported.

In Mexican the work is confined to the 1000-foot level and does not indicate any desire to strike ore at least for the present. The work in Ophir is still on the 1000-foot and Central Tunnel levels. Nothing new is reported from it either officially or privately. Active work is the order in Con. Virginia on the 1350-foot, 1650-foot and 1750-foot levels. The official letters are far from discouraging, although more time will be required to show results expected. There is nothing new to report from the Best & Belcher and Gould & Curry joint work. In the latter mine they are raising low grade ore. It assays mostly silver. No work in Hale & Norcross. In Cholar they are still repairing the main incline below the 1100-foot station. In Potosi on the tunnel level the official letter reports active work with the grade of ore lower on some of the stopes, while it varies in the south drift. On the 100-foot level prospecting work is being done; it looks quite favorable, particularly if they get some shorts on the shares. Nothing is reported from Bullion and Exchequer. From Alpha nothing important is made public. In the Con. Imperial, Challenge and Confidence joint west crossdrift a large flow of water was struck; not being accustomed to it, the miners quit work until the 9th, when work was resumed again. It looks as if they are nearing the west, or gold-bearing ledge. The late flurry in the Crown Point shares has admitted of the management striking an assessment, which may cause enough selling to admit of their striking rich ore in the mine. The work is practically the same as reported last week, as it is in Belcher, Seg. Belcher and Overman. On the 175-foot level of Andes they ran into 25-foot ore, assaying from $5 to $60 a ton. This, when explored, may develop into something of importance.

From the Brunswick lode our advices are of a more encouraging character from Occidental, particularly on the 750-foot level, which was mentioned in last week's issue. They are preparing for exploiting this and also the 650-foot level. In Potosi they are running south on the Chollar 500-foot level. As stated in this paper, a joint crossdrift has been started on the boundary line by Potosi and Chollar. Unless stopped, it ought to strike ore. They are stoping ore in Chollar on the 300-foot level. On the 600-foot level active exploiting is being done. They milled 107 tons of ore. Active developing work is being done on the 300-foot, 400-foot and 600-foot levels by Con. Virginia, Best & Belcher and Gould & Curry. No change is reported in Savage work.

The following illustrates the changes of the week:

MINES.	Nov. 4.	Nov. 11.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,

Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from D. D. Allard et als., in the Cambridge Mine near Plymouth, Amador Co., to deposit tailings on a flat; from W. C. Corbett and A. W. Carmichael, in the McMartin Mine near Onion Valley, Plumas Co., to deposit tailings behind the dam of the Good Hope Mining Co in Onion Valley Creek; from Geo. W. Mohler, in the Mohler Mine near Pike City, Sierra Co., to deposit tailings in a ravine below the mine; from Manuel Silva and Joseph Enos, in the Manuel Silva Mining Company's Mine near Cherokee, Butte Co., to deposit tailings in Spring Valley Creek; from J. H. Kneeland, Jr., in the Colfax Gravel and Pierce claims, near Colfax, Placer Co., to deposit tailings in Long Ravine; from L. L. Sherrod et als., in the American Gravel Mining Company's Mine near Centerville, Butte Co., to deposit tailings in ravines below the mine; and from the Kate Hayes Mining Co., in the Manzanita Mine near Sweetland, Nevada Co., to deposit tailings in the impounding basin of the old Manzanita Mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 29, 1897, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from T. Larimore, in the Conrad & Wheeler mine, near Forbestown, Butte Co., to deposit tailings in a ravine, and from Edward C. Rigney, in the Round Butte mine, near San Andreas, Calaveras Co., to deposit tailings in Batista creek, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on November 15, 1897, at 1:30 P. M.

Skeleton Mining Report.

NEEDED BY EVERY MINING MAN.

FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 82) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 43) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of November, 1897, an assessment (No. 10) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1897, an assessment (No. 8) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Thorpe Mining Company the day of delinquence in the above assessment notice has been postponed to November 20th, 1897, and the day of sale to MONDAY, December 13th, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 4th day of November, 1897, an assessment (No. 8) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of December, 1897, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 15th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 Twelfth street, San Francisco, California.

The secretary will also receive payments from 12 to 3 P. M. at his business office, 225 Sansome street.

SPECIAL MEETING OF STOCKHOLDERS.

Notice is hereby given, that a Special Meeting of the Stockholders of the New El Dorado Gold Mining Company will be held at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, Cal., on MONDAY, November 29th, 1897, at 3 o'clock P. M., for the purpose of considering the sale of the stock now in the treasury, and approving a contract for the development of the Company's property. By order of the Board of Directors. J. W. PEW, Secretary.

Office—No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

CALIFORNIA STUMP PULLER.

The Most Powerful Made! Send for Illustrated Catalogue.

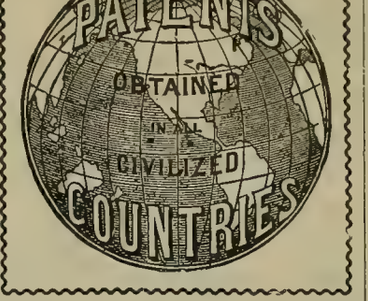
PATENTS



DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Sts., San Francisco.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager,
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

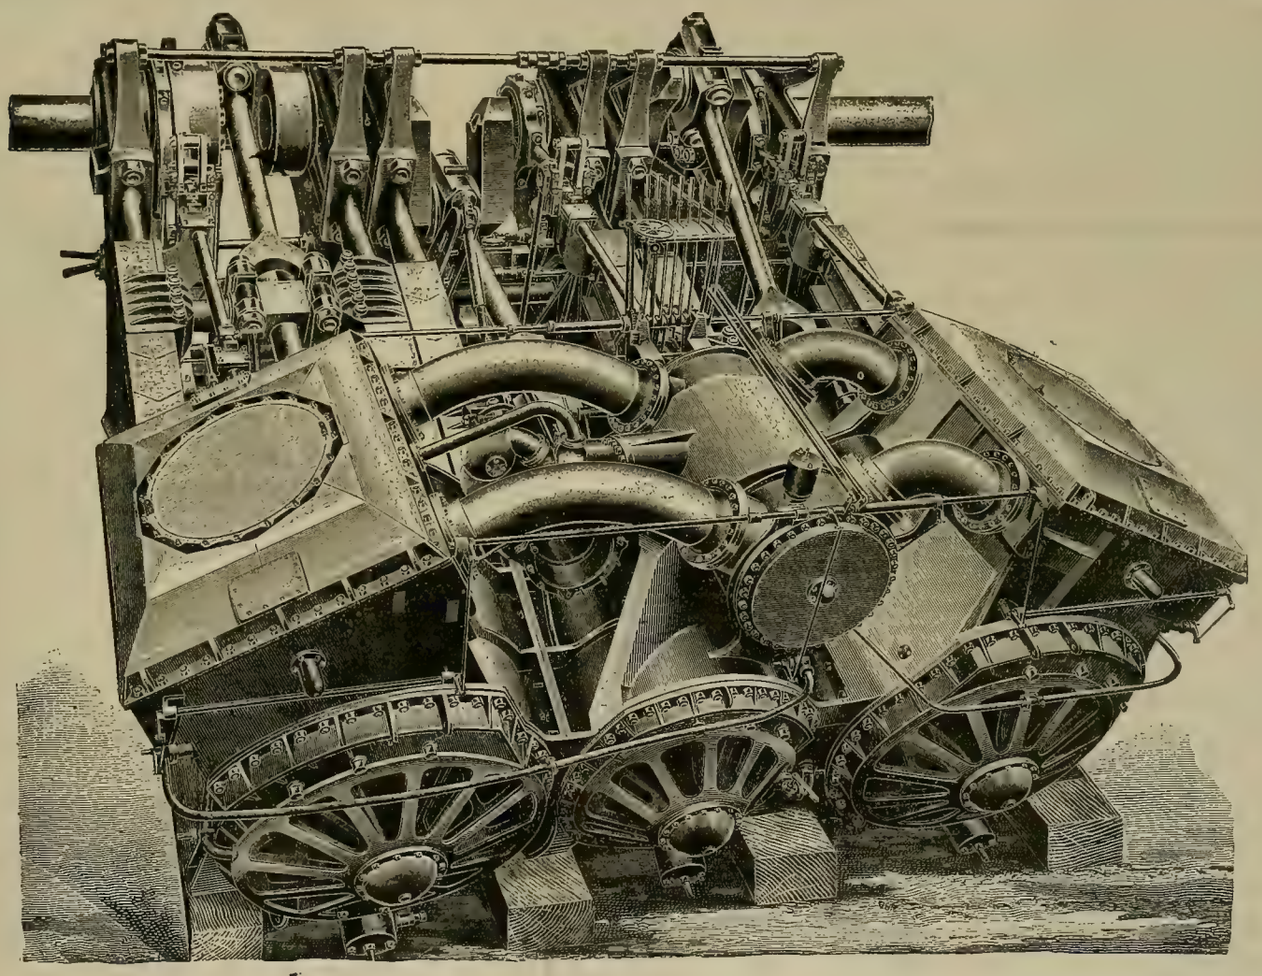
Engines of the Most Powerful Paddle Steamer Ever Built.

The illustration shows a shop photographic view of the largest engine of its type ever built. It is to develop 10,000 H. P., and will drive the excursion paddle steamer, Empress Queen, from Liverpool to the Isle of Man, the steamer being 360 feet over all. The engine is a three-cylinder compound, diagonal type, surface condensing. The high-pressure cylinder, 68 inches in diameter, is placed between two low-pressure cylinders, each of 92 inches diameter, the stroke being 84 inches in length. The high-pressure cylinder has a piston valve, while the other cylinders have flat slide valves, the double eccentric link motion controlling all three. The starting and reversing is done by means of a direct-acting steam and hydraulic engine. The condenser, cylindrical in form, is placed athwartships between the cylinders and the shafting supports. A separate centrifugal circulating pump, worked by an independent steam pump, supplies the condensing water and is arranged to be used as a bilge pump in case of necessity. The peculiar appearance of the high-pressure cylinder cover is due to foreshortening brought about by the position of the camera. The lagging casing was not in place on the cylinder covers when the photograph was taken. Two boilers are installed forward of the engine and two aft, making two compartments. The Fairfield Ship Building and Engineering Co., of Govan, Scotland, are the builders. The Empress Queen is expected to make 25 statute miles an hour.



ENGINES OF THE EMPRESS QUEEN, THE MOST POWERFUL PADDLE STEAMER EVER BUILT.

At the latest session of the Montana State Legislature a law was enacted requiring all mine owners and mine operators to case in the shaft cages used, as a measure of safety to the men. Some of the mining companies in Montana have complied with the law, others have not; and since the adjournment of the Legislature there have been six fatal accidents in the vicinity of Butte, resulting from non-compliance therewith. This fact, coupled with the additional fact that in no mine where the law has been complied with has there been such fatality, emphasizes the need of the law recently passed; and also emphasizes the negligence, to put it mildly, of those whose duty it is to comply therewith. It seems that it is the larger mines in Butte that have acted in ignorance or defiance of the recent statute passed in that State. At a coroner's inquest on the body of one of the poor fellows recently killed, the only defense of the mine managers or owners was that the old miners prefer to ride on the old-fashioned cages—which is no defense at all. The local jury, probably overawed by the influence of the companies, promptly brought in the astonishing verdict that the death of the man was the result of his own carelessness. It would appear as though a test case should be made; and if Montana mine owners cannot be compelled to comply with the law, that statute should be immediately repealed.

Where the stockholders of a mining corporation, being ignorant of the selling value of their stock, authorize the president of the company to find a purchaser and effect a sale of their shares at par, and such president, at and before such time, was in secret correspondence and negotiation for the sale of the stock, with a view to a large profit to himself, and, by affirmative acts and misrepresentations, concealed his transactions from the stockholders, and effected a sale of their stock for a sum largely in excess of par, he cannot retain such excess, but must account to the stockholders for the profits made, notwithstanding he had stated to them that he would retain for his services as agent any sum, realized above that for which he was authorized to sell.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 485.

THE Bullion-Beck, Utah, Silver Mining Company, at a directors' meeting on the 10th inst., decided to allow the mine to remain idle until a better price for silver warranted resumption, which, in brief, is about the present status of nearly every direct silver producing property in the United States.

PROBABLY nothing more strikingly illustrates the great increase in the number of men who have made mining an avocation than the numerous inquiries weekly received at this office regarding points on which the mining world is generally supposed to be well posted, the rudimentary requirements of mining knowledge. The questions are all evidently asked in good faith, and are as faithfully answered.

THE Rossland, B. C., Miners' Union wants an inspector of mines appointed. The last provincial legislative assembly provided for such an officer, but, to date, the Government has not made the appointment. Experience elsewhere with such inspectors is unsatisfactory, the appointment being sometimes considered the political prerogative of some demagogue. The British Columbia miners will do well to unite in a demand for a competent man—some one who has practical knowledge of metal mining and is above the petty tricks of demagogy.

COLORADO now begins to lay claim to ability to mine and mill ore at a low rate. The El Plomo Co., treating free-milling ore in Costilla county, in some experimental runs mined and milled the ore at a total cost of $1.32 per ton. California, South Dakota and Alaska have a record for low figures and economical result in this regard, and there seems no reason why Colorado should not approximate it, though in the case of Alaska there are several elements that tend to make possible cheaper production than almost any other mine on this continent may hope to attain. As is well known, the mine possesses many natural advantages, being practically an open quarry with the cheapest of transportation, as the vein is within 300 yards of tide water (this vein being 400 feet wide) and the handling of the ore is almost automatic. The item of labor is somewhat dearer than elsewhere, but is fully made up in the ease with which the material is handled. Explosives at the mine cost on an average 15 cents per pound. The white men get $2.50 to $3 per day and board; machinists $4 per day and board. Very few natives are employed, those being paid $2 per day, boarding themselves. It is believed that by July 1st, '98, there will be 740 stamps at work on that vein. The Alaska-Treadwell mine has a record of total treatment of ore aggregating about $1 per ton. The Spanish mine in this State has a similar record of 85 cents.

A Mistaken Ruling.

So much has been justly and favorably said in these columns regarding the broad gauge rulings of the new general land commissioner at Washington, D. C., that with regret is noticed a recent ruling by him which, if correctly reported, is neither just nor equitable, and is likely to unfavorably affect a large number of miners.

Some time ago the owners of the Guadaloupe Quicksilver Mining Company in Santa Clara county, Cal., brought suit for judgment against the claimants of a portion of their property, setting up their prior location and the mineral character of the land. They were defeated in their case before the local land commissioner, who held that the land was more suitable for agricultural purposes than for mineral. They then appealed to General Land Commissioner Herrman, who affirmed the rulings of the local officer. In such affirmation Commissioner Herrman takes the astonishing ground that the owners of the Guadaloupe Quicksilver mining property are entitled only to that part of the land where they found cinnabar, and are not entitled to the 1500 by 600 feet which the Federal Statutes allow in each lode location. If any one point can be considered settled it is that the location of claims entitles the owner to 300 feet on each side of the vein and 1500 feet in length. Commissioner Herrman utters the following two sentences :

It has been the practice in ex parte lode claims to accept a discovery as sufficient proof that all the land covered by the location is mineral, in the absence of allegations to the contrary. Where it is alleged, however, that any portion thereof embraced within a claim under the agricultural laws is non-mineral, evidence may be submitted on that issue, and if the allegation is proved, the mineral claim will be rejected to that extent.

This is not law, nor fact, nor common sense. Ever since May 25, 1872, any individual or corporation locating a lode has been given the right to take the surrounding surface to the extent of 1500 feet in length by 600 feet in width. According to Mr. Herrman, if any of this included area can be proved to be agricultural, the miner cannot hold it.

It is hardly necessary to point out that, if Mr. Herrman is correctly reported, he comes in direct conflict with the Federal mining law, and it is of course plain that his ruling will be reversed whenever opportunity occasions it necessary to overrule such unwarranted affirmation.

Misstatements.

A good or bad example of "rot" is the statement in last Sunday's San Francisco *Examiner*, wired from Rawlins, Wyoming, regarding alleged gold discoveries at Grand Encampment. It has long been asserted that such "dispatches" are paid for at so much a line. It is such ridiculous work that tends to discredit mining. Apart from principle, but purely as a matter of business, it is manifestly a mistake to secure anywhere the publication of such stuff. An unsuccessful effort was made to have published in these columns a "letter" regarding the same "discoveries."

No good purpose can be served by such mendacity. No one whose opinion is worth anything is fooled. In these days of big "Yukon Transportation" Companies with ridiculous claims and extravagant suggestions some latitude may be allowed for wild claims, but statements soberly asserted of alleged "discoveries" should at least have some valid foundation. The surprising part of the Wyoming "news" is that one of the gentlemen who figures in the "dispatches" owns or controls a Colorado publication that is particularly severe on mining frauds and fakes, and weekly scores in just and merited criticism sundry attempts to falsify or make statements that can be successfully contradicted.

It is deemed unwise to make proclamation of statements that are untrue as to mining matters. No good can accrue, and some harm usually results. The recent scare heads in the San Francisco dailies, and wired announcements of the investment of English capital to the extent of half a million dollars in the "purchase of the Grand Victory mine, on Squaw creek, in El Dorado county, Cal., seven miles southeast of Placerville, by the Transatlantic Mines Purchasing Syndicate, Limited," is another glaring instance of such misstatements. It simply brings a few parties into temporary notoriety, who get their names in type; but it discredits everything else connected with it.

Regarding the allegations in the dailies of the sale of this mine, it may be said authoritatively that there was not one iota of truth in the published statement. The facts are that a short option was given some months since, with the right to expend a certain sum of money; no sale was made, no purchase was made, and no possession or transfer of any kind was given.

Will Probably Not Be Appealed,

In Trinity county, California, last week, Judge Jones, of the Superior Court, decided a case of some interest to miners generally. The action was brought to quiet title to the Washington quartz mine, in the Bolt's district, Trinity county. Ten years ago, the Daisy quartz mine claim was located in that county, in the usual form of a parallelogram, 600 feet in width by 1500 feet in length. From the date of its location, the mine was worked continuously by the locators, and more than the $100 worth of necessary work was done each year, including the present year. During the work three parallel ledges were uncovered, shafts sunk, upon which tunnels were run cutting two of the ledges (Nos. 1 and 2), and extending almost to ledge No. 3; and considerable work was done in general. Last July the plaintiffs in the case relocated two of the three ledges. The plaintiff did not deny that the defendants had located the claims, worked them, and spent considerable money during all these years; but brought action for possession upon the allegation that the mine was located originally upon placer ground at that time located, and that defendant could only locate and hold 25 feet upon each side of one of the ledges, where notice of location had been posted; that the other two ledges which he had attempted to occupy were 25 feet on each side of the lode line, and were liable to relocation.

The plaintiffs' case hung on the claim that a quartz location upon a placer location could only embrace 1500 by 50 feet. The defendant claimed that a regularly located quartz claim upon placer ground did not come under the provisions of Section 2333 of the Revised Statutes of the United States, which provided that the applicant for patent must pay the Government $5 an acre for a strip 1500 by 50 feet of ground in which there is a known quartz vein or lode, and $2.50 an acre for the remainder of the claim, and cited the fact that they had held possession of the property for ten years. The plaintiff testified to his relocation of the two ledges, and brought on the stand the original locator of the placer claim. The judge ruled out the latter's testimony, sustaining the objection of defendants, who cited the case of Noyes vs. Mantel (127 United States Reports, page 348), in which Justice Field of the Supreme Court held that a regularly located quartz claim is exempt from provision 2333, and takes precedence over the placer claim.

The case was left to the decision of the judge, who promptly gave judgment in favor of the defendants.

IT might be well for those people disposed to criticize speculation in mining stocks to bear in mind that it is a business which is liable to degenerate into gambling, but that it may be pursued as legitimately as anything else. Very frequently one hears the cry that mining stocks should be let alone. It comes from people who do not think, just as much of the speculation is the result of irrational action. In short, there may be in respect of such speculation an irrational inaction as well as an irrational action. Probably no one would say that the speculations of Barnato, the South African king of speculators, was irrational. He succeeded, but it may be taken for granted that there were men who would have told him he was doing a very irrational thing when he embarked upon the career of investment. They would not say so at the height of his success, however, because success then showed that he was right, from a speculative standpoint. If a man buys stock without knowing where the property represented by it is situated he, as a general proposition, does an irrational thing regardless of whether he

succeeds or not. But the man who buys after a careful examination of the whole situation and the relation of the property to mineral discoveries as a general rule does a rational thing, whether he succeeds or not. The chances are that in such a case he will succeed. In the other case if he succeeds he can claim no credit for himself on the score of business judgment. The conclusion of the whole matter is that mining is a business to be pursued according to business methods, and by such methods only.

English Purchases of California Mines.

This paper is in frequent receipt of London letters on California mining methods, being, usually, caustic criticism of local mining ways. In the issue of the 2nd ult. was published a communication which appeared desirous on the part of the writer to argue the case, or at least admit that there might be two sides to the matter. During the week the following was received from the same source:

* * * * * *

I would like in an impartial way, I trust, to offer another example of what I believe was injudicious policy on the part of Californian mine owners. In this case, and in order to distinguish it from the instances presented in my previous letter, I will designate it as C, and say that it is a large and well-known gravel mine; that I know to have been favorably reported upon on behalf of possible purchasers. About four years ago an enormous cash price was asked by the owners for this property, and at that time there were parties here prepared on certain not unreasonable conditions to raise the necessary amount of working capital, without the expenditure of which—something more than $100,000—the property was not only practically worthless but an expense to its owners, a fact that is now amplified by the following from advices dated as lately as last month: "The ——— people are ready to entertain any reasonable offer. That is all they are disposed to say. The amount of the 'cleanup' for the last three years could serve no useful purpose, even if it could be accurately given. The only work done during that time has been a constant clearing off, etc., * * * and the returns have not quite paid expenses."

Reference to this particular property is only now made with the object of making, if possible, more clear to mine owners the futility of their figuring upon foreign capital for the development of their properties so long as they are pronounced or predisposed to merely entertaining proposals that promise a large initial cash payment and, in addition, provide for an indispensable working capital, or, in other words, upon insisting that the buyer should not only run the risk of the outcome, but also pay for the doubtful privilege of assuming it.

Three years out of the four now gone might easily enough have been utilized to some purpose in this case; and the owners, in place of being out of pocket, as they now are, would, if the mines had turned out well, been in receipt of dividends had they but preferred the principles of every-day business to the off chances of arousing the cupidity of some capitalist to whom they may sell their mine right out for all cash.

Enclosed I send you copy of an option on mining claims, which may be called D for the purpose of reference in the event of your being not unwilling to express an opinion either favorable or unfavorable to the terms of the same or to the terms which have gone forward in the shape of a counter and alternative proposal. I also send copies of reports, and, if you can afford the space, you are at liberty to publish the option and proposals in any manner you please.

Following are the proposals and option referred to:

Copy or Synopsis of the Conditions of Original Option Given in California:—

1st.—The sum of three thousand dollars shall be paid not later than the 1st day of November, 1897.

2nd.—The sum of three thousand dollars shall be paid not later than the 1st day of July, 1898.

3rd.—The sum of sixty-nine thousand dollars shall be paid not latter than the 1st day of May, 1900.

4th.—Paid up non-assessable shares of the company to be formed for the working of this property, to the amount of twenty-five thousand dollars, shall be issued as soon as the company shall have been organized, in such parcels as may be desired.

5th.—Time is the essence of this option.

6th.—The obligations incurred are binding on the heirs and assigns of the parties.

7th.—Said ——— or his assigns shall have the exclusive right to enter upon these tracts of land for mining purposes during the continuance of this option.

Primary Proposal, Oct. 5th, 1897:—

1st.—The sum of fifteen hundred dollars shall be paid not later than the 15th day of December, 1897.

2nd.—Development work shall be begun not later than the 31st day of January, 1898.

3rd.—The sum of forty-five hundred dollars shall be paid not later than the 15th day of September, 1898.

4th.—The sum of fifteen thousand dollars shall be paid not later than the 28th day, 1899.

5th.—Paid up non-assessable shares of the company to be formed for the working of the property, to the amount of fifteen thousand dollars or the equivalent thereof in stg. at $5 ₱ £.

(New option to contain clauses to correspond with the original as to 5, 6 and 7.)

Secondary (or Alternative) Proposal:—

1st.—Development work shall be begun not later than the 15th day of January, 1898.

2nd.—The sum of six thousand dollars shall be paid not later than the 31st day of August, 1898.

3rd.—The sum of twenty thousand dollars shall be paid not later than the 31st day of December, 1899.

4th.—Paid up non-assessable shares of the company to be formed, etc., to the amount of fifteen thousand dollars or the equivalent in stg., etc.

(5, 6 and 7 per original option).

One is the proposition of the owner considering the value of the property as put here in figures. From some local knowledge, we would say that the owners' proposition is a fair one, saying the main value is correct. As regards the second proposition, saying the property is worth what it is, the cash payment is smaller than it ought to be. As regards the other payments: that might be as between owners and purchasers; as far as the other figures go, it is mainly a matter of agreement.

Regarding the third proposition: It is possible that the development work may be made of special value to the property, provided the English parties did not take it. That would be altogether owing to the position and present development. The cash payment, then, saying that they accepted it, is a fair guarantee, connected with the work, that the proposition would be carried out, and if not carried out, not likely to be of detriment to the present owners. The payments after that may be simply a business matter between owners and purchasers.

In further comment it may be in place to publish the following letter. It was written privately in answer to an English inquiry for California mines. The writer of the letter is thoroughly acquainted with the general facts, is a leading Californian, has charge of one of the greatest manufacturing enterprises in the United States, and is recognized in mining, manufacturing and mercantile circles as being "strictly business." As stated, the following was written solely for private use, but it so admirably states one fact concerning this much-discussed question that it is given herewith:

* * * * * *

I do not consider it difficult to get hold of good mines, provided the purchaser has the money to pay for them. There are quite a number of very good properties held by one or two people, or by close corporations, that are paying dividends; the parties are not looking for a purchaser. I feel sure, however, that they could be purchased, but the price would be practically all the mines are worth.

The mine in question is a close corporation, is paying them monthly from $20,000 to $25,000, has a —— stamp mill upon it, and the price of this mine would be somewhere between $1,250,000 and $1,500,000. Whether this mine upon investigation would show the amount of ore in sight that the purchase price would call for I do not know. The developments made on the mine are more than necessary to keep well ahead of the mill, as it is expensive to keep levels open. They expect to build another —— stamps on the property next spring, when the output will be largely increased. The property consists of —— patented surface claims, and is unquestionably one of the large mining properties of California.

It is very difficult to get hold of a good mine under a bond, as people who own good mines are not willing to tie them up and have them hawked all through the American and English markets. The time has come when purchasers must put up money in order to show that they are responsible parties. There are a few old mines still left in California that might be considered good mines—that is, mines that have a record, were shut down years ago when wages were excessively high and it was difficult to handle the water, but no good going mines can be gotten hold of without putting up the cash at once. If you know of anyone willing to pay for mines without asking for long time and accommodations, I think you can be supplied.

FORTY days remain in which to do assessment work on unpatented mining claims for the year ending Dec. 31st, '97. Holders who have not yet done this necessary work and complied with the requisite forms take the chances of having their claims "jumped" or relocated unless the $100 in work or improvement is put upon each unpatented claim. Where the owner or owners of a group of adjoining claims can show that the work done on one of these claims actually improves or develops all of them, that amount is sufficient, but the intent and the fact must be clearly shown. In all cases of annual assessment work it is to be remembered that the proper notice, record and affidavit must be made to avoid possibility of legal trouble later on.

MOST of the prevalent currency plans are based upon a proposal for retirement of the greenbacks, but one, which seems to have some present favor, holds that the silver certificates should be destroyed. This plan is that the Government shall issue 2½ per cent consol bonds, in exchange for which the silver certificates shall be retired, the inducement to the national banks to increase their circulation to the same amount as the certificates are diminished being the privilege of issuing their notes to the face value of all the 2½ consols they may purchase. This plan appears to be devoid of merit. The silver certificates now in circulation amount to $372,000,000; the plan herein briefly outlined would entail an annual loss to the Government of $9,300,000 in interest, and after such costly exchange the national bank notes proposed to be issued in place of the redeemed silver certificates, viewed from any financial standpoint, would be as onerous a burden on the currency's stability as any present condition possibly can be. This is one of the cases where change is not progress.

CYANIDE OF POTASSIUM has now assumed such importance in the mining world that, its production having become a staple article, its price is of considerable importance. It has been the subject of governmental interference and considerable legislation in other countries, the effort being to give it to the miner on as favorable terms as possible. At the meeting of the General Traffic Association, in Hot Springs, Arkansas, next month, there will be an effort made for the first time to adjust the matter of transportation charges in this country, that the burden may be lighter on the consumer. John Dern, Manager of the Mercur mine, Utah, proposes to appear before the classification committee and secure, if possible, the reclassification of cyanide under the tariff. As an instance of the burden to the consumer, it may be mentioned that the rate from New York City to Salt Lake City, Utah, under the present transportation tariff, amounts to $1200 per carload of twelve tons, to the latter city, there being, of course, local charges to other points in that State where it is used. It is probable that the railroads will give sufficient attention to this matter to satisfy the just claims of the consumer.

THE article in last week's issue on the Edison magnetic process for separating the iron from the sand in New Jersey has attracted considerable attention, and doubtless will attract more, by reason of the fact that there are such large deposits of magnetic iron sand on this coast, which, in addition to the valuable magnetic iron, contains considerable gold; and it is now expected that the process which the great electrician has made a success of in New Jersey might be applied to those deposits in California and elsewhere on this coast—the iron to be a by-product of the gold, or the gold a by-product of the iron. There is a large deposit of magnetic iron on the beach near Santa Cruz, Cal., about one mile from tide water, which has been worked at times for the gold it contains. Three years ago a separator was used, with a capacity of 1000 tons per day. It is in the nature of a drift mine, as there are 20 feet of earth above this beach sand. It can be got out, so it is said, for 15 cents per ton, and, it is believed, will average $2.50 per ton in gold. At Crescent City there is a similar deposit, and at many other places on the California coast black sand has been worked for the gold. The chief difficulty so far has been the inability to do anything with magnetic iron ore. At Gold Bluff, Cal., the storms concentrated beach sands at times to a degree that made it profitable to work them; but ordinarily there is hardly decent wages in it. If a market could be found for the iron ore, on this coast, an application of Edison's New Jersey operations should be profitable at various places in California and Oregon.

Forest Reservations in Southern California.

Southern California residents take much interest in the forest reservations already made south of the Tehachapi and are moving vigorously for additional reservations. W. M. Tisdale of Redlands has prepared the following article:

Location and Area.—The reservations are known as San Gabriel, San Bernardino and San Jacinto, and aggregate more than 2,000,000 acres. The smallest is that of San Gabriel, the most westerly. The San Bernardino and San Jacinto reservations, each of 737,280 acres, are about ninety miles from the ocean, on the slopes of the Sierras, which separate the fertile cultivated valleys of southern California from the Mojave and Colorado deserts. The longest slopes are toward these valleys, and are traversed by the numerous mountain streams which supply the whole section with water for irrigation and domestic purposes. From the bases of the mountains on the north and east stretch away broken, undulating and barren desert wastes, watered only by infrequent springs and wells.

The San Bernardino and San Jacinto reservations are almost continuous, being separated by the narrow pass of San Gorgonio. Together they form a large and immense valuable forest reserve, which includes the three highest mountains in southern California, San Bernardino, San Gorgonio (sometimes called Grayback) and San Jacinto. San Gorgonio is the highest of the three, about 11,500 feet, but they are all noble and imposing. On San Bernardino and San Jacinto there is a sparse growth of timber nearly to the summit, but the timber line of San Gorgonio is several thousand feet below the summit, and the gray appearance of its barren crest, covered with masses of broken rock, has given it its popular name. Late in September of the present year I saw on the northern slope of San Gorgonio scattered patches of snow, the remnants of last winter's falling, and a day or two later its summit was whitened by the first light snow of the coming winter season.

The Forests.—The forests of these mountains do not compare in extent and majesty with those of northern California and of Oregon. From the lumberman's point of view they are insignificant, and, at a little distance, the transient tourist who views them only from the south and west sees no forests worth mentioning, and goes away with the impression that the slopes of the mountains are all barren. But when the canyons and the valleys are penetrated that lie between the successive ranges, especially in the north and east, forests are found that are certainly beautiful, if not of great commercial value. At intervals there are stretches where the pines have crowded out all other trees, and one may ride for miles unimpeded by underbrush among their huge and towering trunks. But most of the forests are composite, principally made up of pines, firs, balsams, spruces, larches and deciduous and live oaks. The streams are bordered by willows and alders. Occasionally a puny maple is seen, very unlike the handsome maples of the East, and the bay tree flourishes at certain altitudes. The forests of this region are between the altitudes of 4000 and 8000 feet.

In places the chaparral is dense, made up of manzanita, buckthorn, wild mahogany, the madrona, greasewood, etc. Some of these bushes are covered with long, silvery, frond-like blossoms, or, as the manzanita, for example, with red or scarlet berries. Holly and mistletoe are frequently to be found, and many gay flowers, such as the golden rod, clematis and the bright blossoms of various species of cactus. Where there is moisture there are many varieties of ferns.

Animal Life.—These mountains were formerly overrun with animal life, but the too ready rifle of the hunter has changed this condition. Grizzly and cinnamon bears and wildcats are still found occasionally in the deepest recesses. Deer are comparatively plentiful and hundreds are shot every season. Gray squirrels abound, although they are by no means as numerous as in former years. Brown squirrels and chipmunks, too insignificant to tempt even the most wanton marksman, are abundant. The streams are full of trout and are kept replenished from year to year from State hatcheries. The same variety, the California brook trout, in the waters of the only lake in this region grows to enormous size. This lake also affords fine duck shooting in the winter. The mountain quail, larger and handsomer than the quail of the valleys, is found in large numbers. Doves are also plentiful. Among birds not fit for food are bluejays, woodpeckers, owls, hawks and condors. Of reptiles, the rattlesnake is the only one of importance. Theoretically, this venomous creature is a terror to many, who for this reason are unwilling to enter these regions. Practically, one may ride for days without seeing a single specimen, and the instances of injury from its bite are rare indeed.

A Forest Resort.—A resort known as Seven Oaks is the center of one of the most beautiful of the park-like districts among these mountains. This is a collection of tent houses and log cabins, whose hospitality is open-hearted and without ostentation, and where good company and good cheer may always be found. Here one may rest and study nature, or may plan and execute a great variety of fishing, hunting and camping excursions. The most convenient route to reach Seven Oaks is by wagon twelve miles from Redlands to a point near the western base of Mount San Bernardino. Thence a mountain trail, nine miles through the forest, takes the traveler to his destination under the northern base of the same mountain. It is difficult to understand, without actual experience, how completely this day's ride isolates one from the busy workaday world.

On every hand mountains rim the valley in which Seven Oaks lies, with a distance of, perhaps, twenty miles in each direction from ridge to ride. The Santa Ana river, the most important stream in this section of southern California, traverses the valley from east to west, finding its sources at the greatest elevations and fed by smaller tributary streams. From the heights above these waters one may look down, toward the east, upon the wide stretches of the deserts, broken by ranges of low hills with great variety of color and topography.

The Santa Ana River.—The Santa Ana curves to the northern side of this valley, and between it and the heights of San Bernardino and Grayback, on the south and southeast, are wooded benches where one may ride for hours in the shade of beautiful trees. Bridle paths, or trails, traverse them in different directions. Wherever there is moisture from springs or streams mountain meadows or cienegas are found, and herds of cattle are pastured on these. In spring and summer the grass is abundant and luxuriant. The slopes on the northern side of this valley are less heavily wooded than on the south. On surmounting them the range could be crossed into another valley of less extent and at a higher elevation, about 6000 feet above the sea, and here would be found Bear Valley Lake, a storage reservoir for irrigation purposes. Its outlet is Bear creek, which rushes away to a junction with the Santa Ana, and the two, united, sweep on their course to the orange groves of southern California, their waters keeping the finest of these in health and productiveness. These valleys are among the most important, and are typical, in their general characteristics, of a series which extends from the ocean to the southeastern slopes of San Jacinto, in a semicircular sweep of more than a hundred miles.

Importance of Water Protection.—There are no mills for sawing lumber in this immediate vicinity, although there are a few farther westward. There are some mines, but most or all of these are on the desert side of the range. Here and there a pioneer had acquired title to a bit of arable ground, with an appurtenant water right, before these lands were set aside as a forest reservation, and some portions have been granted to railroads. All of these vested interests will, of course, have to be protected or adjusted in whatever regulations may be made for preserving these forests, but no intelligent man who has studied the subject at all could hesitate for an instant in his opinion as to the absolute necessity for preserving them. They shelter the sources of the waters upon which depends the prosperity of all of southern California. Irrigation will depend more and more upon storage reservoirs, for the limits of available water supply under the present system of use are already in sight. If these mountain valleys were denuded of their forests the winter rains would rush down their precipitous slopes in torrents, and there would be little or no flow of summer waters. Under such conditions orange growing in southern California would be a most hazardous occupation.

The deadliest foes to these forests have been not the miners, nor even the lumbermen, but the sheep herders and careless campers, in whose wake came devastating forest fires. The sheep have now been driven away and the campers have seemingly been educated or frightened into greater care. It is certain that forest fires have been less frequent during the past summer than formerly. Appreciable efforts are being made to enforce the laws governing these reserves, and are effecting good results.

Electric Power Supply.—A new and important interest which will be useful in preserving these forests is that of the companies now being formed, and some of them at work, for establishing plants to generate electricity by the fall of the same waters which furnish irrigation. Some of these plants will each be capable of developing as high as 10,000 H. P., which will be utilized in Los Angeles and at intermediate points for purposes of lighting, manufactures and transportation. These interests will be valuable and will help on the rapid development of southern California. But they, even more than irrigation, will demand a continuous supply of water, which must not fall below a certain minimum. This flow must be maintained throughout the long dry summers, and every effort will be made to secure the volume of water and to lessen the loss from evaporation by expensive systems of tunnels cut through the solid rock. These are very fascinating projects, and so feasible that they will doubtless rapidly be pushed to completion. Thus private interests may accomplish more in the end than the fear of the law or Government patrol toward maintaining the integrity of these reservations.

Need of Roadways.—But roads will be needed in order that these plants may be constructed and maintained. By these roads these unique mountain nooks will be rendered accessible to the multitude, and their charm of isolation and primitive grandeur will be at an end. When the multitude comes into the forests the mountaineer, to whom they have been sacred, and by whom they have been loved, will have no other refuge than the desert. Progress, which is the greatest good to the greatest number, is destructive of romance and of the refined pleasures of the few to whom nature in her lonely and rugged moods is a source of constant pleasure. Comparatively few Californians know their own mountains well. They dwell within sight of them, year after year, ignorant of the beauties which so abundantly repay the slight efforts and sacrifices involved in exploring them.

The Divining Rod Finds a Champion.

The notion that one could detect the existence and position of a stream of water flowing underground at a depth of a hundred feet or more by the peculiar behavior of a hazel twig held in the fingers has been looked upon in modern times as a ridiculous superstition. And anyone who seriously maintained that there was even a little foundation in fact for such a belief exposed himself to the suspicion, if not the charge that he was a "crank." Scientific people, and particularly the geologists, have discredited all stories of this sort so long and so decidedly that other folk have been justly ashamed to evince faith in them.

Now, however, a professor of physics in the Royal College of Science, approaching the subject with a distinct prejudice antagonistic to the theory, has been led to change his mind by an extended investigation. His name is W. F. Barrett, and the subtitle of the treatise in which is embodied the result is "A scientific and historical research as to the existence and practical value of a peculiar human faculty, unrecognized by science, locally known as dowsing."

The first great step in this work was to collect all available narratives in regard to the use of the divining rod. The next one was to sift these, like testimony in court, by corresponding with disinterested witnesses and finding out how far the original statements could be substantiated. In a few instances the investigator got hold of a person who was said to possess the faculty of finding water with a twig or similar device, with the aid experimented with the "dowser."

Abundant Evidence.—In time Prof. Barrett was confronted with an amazing quantity of evidence. Scores, if not hundreds, of these tales are given in his treatise. Here are three samples: A sanitarium was to be built on high ground in Somersetshire, England. The site was apparently a dry one. Three professional "dowsers" were sent for separately, each unknown to the others, and each working under the conviction that he alone was employed. All three pointed to the same spot. A well was sunk there, and abundant water was found. William Ward Spink, a justice in British Columbia, walked about over his grounds for an hour, blindfolded and carrying a divining rod in his fingers. Every time the wand dipped an attendant drove a peg into the earth.

In many cases the justice would pass over a spot where the rod had moved before, and it would invariably give the same sign again. He dug wells at only two of the places indicated, but got water in both. The man declared that if he stood over a garden hose with a divining rod in his fingers he could tell by its conduct when the water was turned on and off. At Newport, Monmouthshire, a well was sunk to a depth of 51 feet without success. Local experts, noting the character of the soil, then pronounced the quest hopeless. A Cornishman who was present advocated a trial of the divining rod, with which his boy, aged eleven, had had some successful experience. The lad was sent for. In his hands the twig gave distinct signs. But the people who would have to pay for the excavation were skeptical and hesitated. The Cornishman offered to take the contract himself, and stipulated that he would demand no pay if no water was found. The job proceeded on that basis. At a depth of 48 feet the diggers struck a gushing vein, and were obliged to flee for their lives.

Lord Byron's Mother-in-Law.—Among the numerous amateur "dowsers" of whom Prof. Barrett has heard is Lady Milbanke, mother-in-law of Lord Byron. Having witnessed performances with the divining rod by a peasant during a visit to Provence in 1805, she took the twig into her own hands and was startled by the discovery that it behaved for her exactly as it did for the Provencal. Two years later she was staying with the wife of a nobleman in Huntingdonshire, and her hostess was bewailing the failure of efforts to find a suitable supply of water for a dairy. Thereupon Lady Milbanke obtained some hazel twigs, walked over the ground, located a well for her host and hostess in their presence, and had the satisfaction of learning that a fluent spring was struck in consequence of her advice.

The record of several professional users of the

divining rod is given in brief by the investigator. W. Scott Lawrence of Bishopston, Bristol, was for twenty-one years a church warden—a fact, presumably, affording some indication of his character for honesty and veracity. For sixty years he had a reputation as a water finder, although his regular occupation was that of a stone merchant. Over a hundred persons testified that Lawrence found wells for them.

English and American Dowsers.—John Mullins of Colerne, Chippenham, Wiltshire, practiced the art of dowsing for gain for thirty years, and made it a rule not to accept pay unless he found water by means of the divining rod. On one occasion, at Waterford, the Diamond Boring Company had gone to a depth of 1000 feet without success. Mullins was called in, agreed to find water at a depth of 90 feet or less, and reached it at 84 feet down. An American dowser, Cyrus Fuller of Plymouth, Wayne county, Michigan, who died in 1893 at the age of eighty-five, enjoyed the highest reputation for integrity and truthfulness. He is credited with having found 200 wells, and, unlike most experts of his class, is said never to have experienced a failure.

In two instances mentioned by Prof. Barrett hidden coins were found, apparently through the guidance of the forked twig. But in a later volume he will go into the matter of discovering minerals and oil in this manner more fully than was deemed advisable in this essay.

How to Divine.—The typical divining rod is shaped somewhat like a wishbone, and is about 1 foot long. The tip of one prong is held in each hand, and the hands are kept 8 or 10 inches apart. The elbows are usually in contact with one's sides, and the forearms extend straight forward, horizontally. The twig itself stands almost vertically in front of the dowser's chest. In the majority of cases reported the upper part of the rod swayed toward the operator's body; but in a few instances it moved in the other direction, namely, downward toward the earth. The violence of the movement seems to vary greatly. If the twig was so held that it could move freely it would, perhaps, revolve on an imaginary axis extending from one hand to the other. It is related that on some occasions, when the twig could not revolve, it would be badly twisted and bent, and would even be broken. Much variety is discernible in the accounts, both as to the way of grasping the rod and the latter's behavior.

Twigs from other trees than the witch hazel worked equally well in some hands, and a curious lot of substitutes have been employed. Among these are an aluminum bow, a flat steel wire bent like a horseshoe, a pair of tongs, and a long German sausage! Leicester Gataker of Bath, England, practiced the art without any of this apparatus, merely holding his open hands out in front of him, palms downward, much as one would warm his hands over a low stove. The sensations which different dowsers report are diverse. Some operators say that they feel a tingling in their hands or bodies when they find water with a divining rod. Others pretend to experience a severe shock. Discomfort, approaching nausea, affects the stomach sometimes. Several professional operators say that the work is exhausting, especially to a person advanced in years, and they have been seen to reel and totter while conducting a search.

The Man, Not the Hazel.—Although Prof. Barrett doesn't attempt fully to explain these phenomena, he has clear convictions on one point. He is confident that it is the operator, not the rod, that discovers the water. The movement is not due in genuine cases, he believes, to any attraction or repulsion exerted upon the twig (or the substitute therefor) by the hidden stream, but to muscular action, exerted unconsciously in response to some inward inspiration. Some psychologists have been accustomed of late years to assign many human sensibilities and activities to a part of the spiritual nature that lies below the level of consciouness, and which they call the "sub-conscious self." "Subliminal" is another common name for it. Prof. Barrett is inclined to think it possible that the faculty which some people seem to possess of finding water and metals in the manner described resides down in the "subliminal," but further investigation is necessary, he admits, to establish that theory.

The professor's theory is interesting, but not convincing. Meanwhile, any one claiming to possess the "gift" can find remunerative employment, if successful, in several localities in California.

BROUGH SMITH states that in the gold fields of Victoria pieces of highly mineralized fossil wood taken from the deeper workings, as well as timber used for supporting galleries, showed under the microscope patches of gold adhering to and intermixed with crystals of iron pyrites all through the central parts of the wood. This is confirmed by Mr. Ulrich, who says that in the gold drifts pyrites is often found in crushing or replacing roots and driftwood, and that samples, on assay, yielded from a few pennyweights to several ounces per ton. According to H. A. Thompson, a specimen of pyrites from the center of an old tree trunk assayed above 30 ounces of gold per ton.

English Capital in American Mines.

TO THE EDITOR:—A correspondent, over the *nom de plume* of "Argonaut," in the *Mining Journal, Railway and Commercial Gazette*, of London, gives California, Nevada and Idaho mining interests a thrust, and, taking his views, no one holding English capital should invest any money in either of these States with the expectation of ever making a dollar, and, as evidence, cites several bad ventures. The writer says: "I have often been astonished on observing the facility with which absolutely worthless mines have been sold in London." While we admit some "absolutely worthless mines" may have been sold in London, I will ask: Whose fault is it? They universally send their own English experts to report on their values before they pass out a dollar. The correspondent again says: "Since 1862 but two companies have ever received any dividends from their investments in the State of Nevada." Even admitting this—which I do not—it does not count against the State of Nevada, which since 1860 has produced over $600,000,000 and had many profitable mining ventures. I have no time for details. Among the failures enumerated by "Argonaut" is the English mill near Reno, "where," he says, "one Colonel O'Connor sold a group of mines, from which not a ton of ore was ever extracted, and where the company expended large sums of money on furnaces and mill, besides digging several miles of water canal capable of carrying the whole Truckee river." This shows great incapacity in the directors, all of whom, if I remember rightly, were English—not only that, but it was a senseless mining venture, any way—building such works for mines "from which not a ton of ore was ever extracted."

Now, the writer happens to know something about this operation, as it originated and was handled in the beginning, not by Col. O'Connor, but by "Col." Boyle, who for some time previous was my principal blacksmith (and a very satisfactory one he was). Mr. Wm. Boyle concluded to visit London, which he did, and in due time "Col." Boyle returned to Virginia, accompanied by a member of Parliament, who finally entered into the "colonel's" projects. I will simply say Col. Boyle was not an American and, further, that the operation from the first was considered a bad one by the mining men then engaged on the Comstock, among whom was your humble servant. "Argonaut" further says: "If we travel over Nevada, in each and every county, we find worthless mines with costly reduction works abandoned."

I know a number of reduction works abandoned in the State of Nevada on account of the fall of silver and exhausted mines at the same time. These mills and mines produced some $400,000,000 of gold and silver, and many were largely profitable. "Argonaut" further says: "Millions of English capital have been invested in California since 1850, and only three paid handsome dividends." "Argonaut" possibly shields his observations by the word "handsome." What a set of blockheads these English investors are, according to "Argonaut!" Well, we'll let it stand that way. Since 1850 thousands of Americans have made millions out of California mines, and California mines have made more millionaires than can be found in any State of the same population. California has produced to date about $1,315,000,000; and, according to "Argonaut," all has gone into the pockets of Americans. I only wish it were so, but I know it is not. Speaking of Capt. Johns, who has represented an English company for years, "Argonaut" says: "He has been traveling constantly through the mineral districts, and for twenty years the Utica, Kennedy and Rawhide mines could have been bought for a song."

That is a fact. Why did not Johns buy them? There is a good reason for it. Who knows of an English company anywhere in California having pluck enough to take an old abandoned mine—one they knew nothing about previously—and, on a venture, put up $100,000 to find out if representations made by Americans were likely to be correct? Capt. Johns is an experienced, first-class miner, and has judgment enough not to speak to his company of properties where he cannot see the lodes with his own eyes, measure their proportions and estimate their values. "Argonaut," for a wonder, gives a good word for Iron Mountain (now Mountain Copper Company) of Shasta county, Cal. He says: "With their skilled metallurgist in charge of mines, furnaces and mill, stockholders need not feel the least alarm for the future." I do not care to "talk out loud" respecting this institution. If I did, it would take a couple of columns. I now simply say, "Coming events cast their shadows before." Winding up the tirade against California, Nevada and Idaho, "Argonaut" says: "Englishmen should think twice before they invest a shilling in American mines. The feeling in Nevada is intensely anti-English, and it seems strange that our countrymen should fall such an easy prey to the San Francisco mining sharpers."

If the feeling in Nevada is so intensely anti-English, they have no doubt a good cause for it. There is one peculiarity with the English in *our* mining sections: they generally act as though they considered anything in sight they wanted belonged to them. As to sharpers, if the American can beat the English he has got to be very sharp. Take all the American mines put forth for sale in London by Americans. If you will look very closely, you will find several Englishmen "under the fence" somewhere. They are the fellows who "load up" values on their countrymen five to one, if not more, put the deal through, and are sure to take the "lion's share" of the profits of sale. Before "Argonaut" closes he shows the purpose of his assault on California, Nevada and Idaho mining sections by "booming" British Columbia mining localities, which I have no desire to deprecate. If we sell Englishmen our mines, we should seek to make them profitable. It is the better policy in the long run, but it is one thing to buy good properties and another thing to manage them with judgment and economy. The skill of the age in mining mechanics and systems for extraction of the metals have attained such perfection in later years that it is a wonderfully poor property and very bad management to not be a paying proposition.

If English investors allow themselves to be led into unprofitable ventures it is all their own fault, as there are any number of individuals in these latter days having a thorough knowledge of vein structure, value of ores, and of extraction of the metals, to steer clear of bad ventures. Mining of to-day and even twenty years ago is as different as is $5 from $1, and, taking California and Nevada as I know them, there is one vast area of mineral lands, with not one-twentieth part yet touched, all awaiting the incoming of capital and intelligent management to make it "handsomely" profitable.

ALMARIN B. PAUL.

San Francisco, Nov. 13, '97.

The Yuba River Gold Dredge.

TO THE EDITOR:—I noticed an article in your valuable issue of Nov. 13th written by Mr. Gray on gold dredging, in which he favorably mentions the dredge designed by me now running on the Yuba river. He seems to be in doubt as to the gross capacity of the dredge for lifting gravel, which is as follows: The dredge is lifting fifteen buckets per minute, the gross capacity of each bucket being 3.2 cubic feet; this gives a gross capacity of 2550 cubic yards per day. In fair digging ground the buckets can be kept quite full if the winchman is well up to his work and attentive. Owing to the unusual lowness of the river the dredge is not yet on the claim for which it was built, when it has got there and is doing regular work I shall be glad to give you exact working expenses, which may be of interest to your numerous readers. The dredge has for the last month been run with two men per shift and burns about three cords of wood per twenty-four hours.

R. H. POSTLETHWAITE.

San Francisco, Cal., Nov. 15, '97.

Deep Mining in California.

In Amador county the Kennedy mine is being very profitably worked at a depth of 2200 feet, the Keystone at 1400 feet, the Manoney at 1000 feet, the South Eureka at 1200 feet, the Wildman at 1300 feet, the Zeila at 1100 feet, and several others at like depths.

In Calaveras county the Gwin is being worked at 1500 feet, the Lane and Tullock at 1350, the Stanislaus (Melones) at 1000, the Utica at over 1300.

In Nevada county the Champion is down 1200 feet, the Empire 2100 feet, the Maryland 1600 feet, the North Star 2000 feet, the Omaha 1700 feet, the Providence 1700 feet.

This list could be largely extended, but is sufficient for the purpose. These are all good paying, true fissure gold mines.

Deep mining has not much more than fairly begun in California. In Australia, at Ballarat, they are down 3000 feet and still paying.

HENRY S. DURDEN.

SOME interesting statistics have been issued by the Dortmund Mining Bureau regarding the accidents with winding ropes that occurred at the collieries of the district last year, says the London *Mining Journal*. Out of the 270 ropes discarded, 5, or 1.85 per cent, broke suddenly while in use. Out of the 5405 ropes laid on one side during a period of twenty-five years—from 1872 to 1896—254, or 4.70 per cent, broke suddenly while in use. Of the above, breakages occurred in the case of 43 out of 736 flat cast-steel wire ropes, 19 out of the 147 flat-iron wire ropes, 7 out of 97 flat manila fiber ropes, 80 out of 3536 round cast-steel wire ropes and 105 out of 881 round iron wire ropes, while not one of the eight hemp ropes gave way. In 1872 the percentage of wire ropes breaking was 19.30, while in 1896 it was reduced to 1.85.

"WHERE the American engineering excels the British," says John Burns, M. P., "it is not because of the shortcomings of the British mechanics, but because of the wooden-headed and often pig-headed character of the employers, managers and foremen."

Electrical Progress.

The Design of Hoisting Magnets.

In view of the fact that the force of magnetism has been known for so long a time, it is rather surprising, says H. N. Ramsey, in the *Home Study Magazine*, that the electro-magnet has not come into more general use for lifting heavy weights. This state of affairs is occasioned partly by prejudice based upon the presumed unreliability of electricity, and partly by a lack of knowledge of the subject. Fortunately, the presumed unreliability of electricity as a force is not confirmed by practice. In fact, its patrons and users commend it as most satisfactory. There is no reason whatever for any apprehension concerning the ability of a properly designed magnet to do the work required of it.

Let us turn our attention to the practical design of a hoisting electro-magnet, for general lifting purposes,

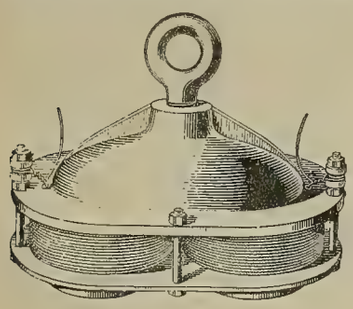

FIG. 1.

whose maximum capacity shall be five tons. We have at our disposal a direct-current supply of, say, 110 volts, and have to determine the necessary current, the length and size of the windings, and the proportions and material of the body of the magnet.

We propose a magnet of the horse-shoe type, with a winding on each leg, as shown in Fig. 1. In order to have a short length of iron or steel for the magnetism to traverse, we will make the legs of the magnet body very stumpy, which will have the additional advantage of reducing the amount of copper winding and current required.

Now, in designing a magnet we should aim at the most economical disposition of material consistent with sufficient mechanical strength. To obtain the latter, and also on account of its superior magnetic properties, we will use cast steel for the body, and will cast the yoke, rim, and poles in one piece. The coils c and c', Fig. 4, will be wound on spools, and then slipped over their respective poles N and S, the direction of the windings being as in Fig. 2, so as to create one north and one south pole. The coils are to be held in position by a $\frac{3}{16}$-inch brass plate b suspended by the rim m of the yoke by four $\frac{3}{8}$-inch brass bolts, a, a', a'', and a'''; a brass cover to protect the windings is also advisable. Brass is used for these parts because it is not influenced by magnetism and therefore will not induce leakage of lines of force, as would be the case if a magnetic metal were employed; for then some magnetism would flow from one pole to the other through the plates and bolts, instead of passing from one pole to the other through the magnet body. The two free ends x and y are connected to a 110-volt circuit, being brought up through the yoke at h and h' in porcelain or hard-rubber tubes. A suitable controller-rheostat, double-pole fuse cut-out, and switch are inserted in the circuit; their several locations depend upon the manner in which we hang our magnet, i. e., whether from the bridge of a traveling crane or from the jib of a hoisting crane.

FIG. 2.

We will now make the necessary calculations: We assume an economical magnetic density, B, of 100,000 lines for each square inch of contact surface N and S, Fig. 2. For this value of B, the number of pounds p that each square inch can raise is:

$$p=\frac{B^2}{72,134,000}, \qquad (1)$$

$$=\frac{(100,000)^2}{72,134,000}=138.62 \text{ lb. per square in.}$$

As we are to lift 10,000 lb. with the two poles, or 5,000 lb. (represented by

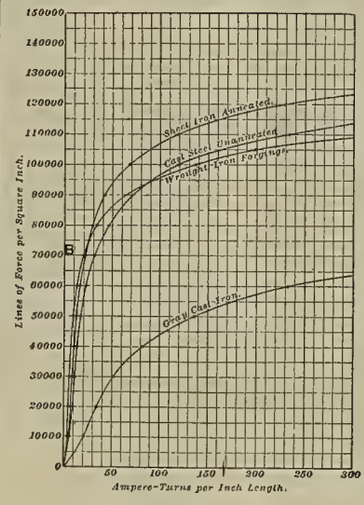

FIG. 3.

P) with one pole, the area A of each contact, N and S, is:

$$A=\frac{P}{p}, \qquad (2)$$

$$=\frac{5,000}{138.62}=36 \text{ square inches.}$$

The number of amperes multiplied by the number of turns is called the "ampere-turns." The ampere-turns required to induce, per square inch, 100,000 lines of force one inch long, is found by referring to the diagram in Fig. 3. Following the 100,000 line horizontally to the point where it intersects the curve for cast steel, we find, from the reading vertically below it, that 120 ampere-turns are required for each inch length of the magnetic circuit. We do not know the exact length of our circuit, but will assume it to be 40 inches (if this assumption is not approximately correct, we shall have to go through the calculations again). Then, the total ampere-turns should be 40×120, or 4,800 ampere-turns.

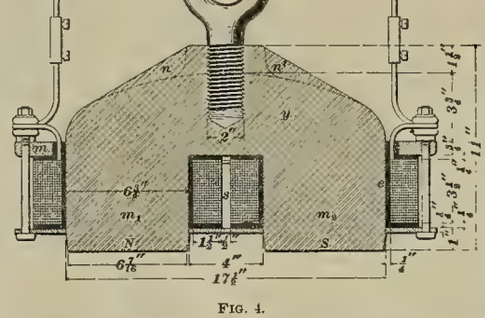

FIG. 4.

We now have to break up this factor into amperes and turns. The size of the wire will first be determined. Whether a current of 1 or of 10 amperes is used, the size of the wire will be the same. Let us see if it is not so. We require 4,800 ampere-turns. Assuming a current of one ampere, the total number of turns is 4,800. Allowing for the thickess of the spool, the average length of one turn f g h, in Fig. 2, is 2.3 feet, if the cross-section of the core is circular. This cross-section, as is readily seen, gives the least length of turn for a given area. This area we will have from formula 2. The number of turns, $4,800\times2.3$ (the average length in feet of one turn) gives 11,040 feet of wire on the two magnets. The resistance of our two windings must be such that with E=110 volts, and C=1 ampere, the wire will have the proper total resistance. Now the total resistance:

$$R=\frac{E}{C} \text{ (Ohm's Law)} \qquad (3)$$

$$=\frac{110}{1}=110 \text{ ohms.}$$

If 110 ohms is to be the resistance of L(=11,040) feet of wire, the resistance r per thousand feet is:

$$r=\frac{R}{L}\times1,000. \qquad (4)$$

$$=\frac{110}{11,040}\times1,000=9.9 \text{ ohms.}$$

This resistance corresponds most nearly with that of No. 19 B. & S. Let us now assume any other number of amperes, say 4. Then the number of turns will be $\frac{4,800}{4}=1,200$; and the total length of the wire on the two magnets when 4 amperes are used will be $1,200\times2.3=2,760$ feet. The total resistance of this wire is $110\div4=27.5$ ohms, and the resistance per 1,000 feet is $27.5\div2,760\times1,000=9.9$ ohms, which is exactly the same as obtained before. But with 1 ampere we need 11,040 feet of wire, while with 4 amperes we require only 2,460. That is, with 1 ampere we need four times the length of the same size wire as with 4 amperes.

The question naturally arises: Which is the cheaper, copper or electricity? Another question is: How many amperes can No. 19 wire carry? We ought not to allow more than 1,000 amperes per square inch cross-section of the conductor. So No. 19 will not take much more than one ampere.

Presuming that we allow for one ampere, in order that the amount of copper and iron and also the weight of the magnet may be as small as possible, we will arrange for 4,800 turns of No. 19, that is, 2,400 turns on each leg. The best cross-section of the magnet-winding will be 30 layers of 80 turns, or $3\frac{1}{2}''$ by $1\frac{1}{2}''$. This dimension, $3\frac{1}{2}''$ by $1\frac{1}{2}''$, is readily found by taking the known diameter of No. 19 single cotton-covered wire, and making due allowance for the fact that the thickness of a layer is slightly less than this diameter, because the wires lay between each other.

We will now draw, as in Fig. 4, the longitudinal section of our magnet from the data obtained. The area of cross-section of the core was found from formula (2) to be 36 inches; consequently the diameter of m_1 and m_2 is $6\frac{3}{4}$ inches. Drawing one core, we allow $\frac{1}{4}$ inch for the spool, as at e, and then put on the wiring. The other core is made similarly with a distance s of $\frac{1}{2}$ inch between the two coils. The cross-sectional area of the yoke at y should be a little larger than that of the core at m_1 or m_2 and should also be so shaped as to have sufficient mechanical strength. The thickness, then, may be $4\frac{1}{2}$ inches, with stiffening ribs n and n'. The rim m is drawn $\frac{3}{4}$ inch thick, as shown, projecting 1 inch beyond the coil. The cores must project below the bolt-heads far enough to clear them, and should be slightly tapered, as this adds to their efficiency.

We have presumed in our calculations on a density at the contact of 100,000 lines per square inch. It is found in practice that when the poles N and S are slightly tapered and the magnetism has a density of 110,000 on the contact surface, a better result is obtained. Reducing our area in this proportion, the diameter of the faces N and S will be $6\frac{7}{16}$ inches.

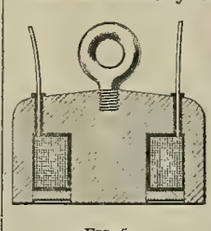

FIG. 5.

Another type is the concentric pole magnet, as shown in Fig. 5. This possesses several advantages, among which we may mention the following: There is only one coil; this coil (c, in the figure) is completely and well protected from mechanical injury or heat, and the magnetic leakage is also small. This style is much used for lifting forgings which are otherwise too hot to handle. It may be well to add that the proportions of all magnets may be obtained in the same manner as that we have calculated.

Electrical Activity at Niagara Falls.

Everybody hereabouts has gone power mad, says a letter from Niagara Falls, and no wonder, for each day as it passes but adds to the certainty that wealth far greater than any to be wrested from the Klondike's frozen sands is to be gotten out of Niagara's green waters by those who have dared to harness the world's greatest cataract. The most marvelous dream of the age is being realized in the quiet-looking, gray power house that stands a mile or two above the falls. Three enormous dynamos, each weighing many tons and whirling along at the rate of 250 revolutions a minute, are constantly transforming water power equal to that of 15,000 horses into the inexplicable thing we call electric energy. But this is only a beginning.

On both sides of the river men are steadily at work in the sunlight by day and in the mystic current's glare by night, making ready for the production of nearly forty-fold more power. By to-morrow, so to speak, enough force will be had from the rushing water to turn every wheel in every factory in every city of the Empire State, including the Greater New York itself. When the work now in progress is done, the total output will be as follows:

	Horse Power.
To be developed in the present tunnel	100,000
To be developed in the second tunnel (not yet built)	150,000
To be developed in the three Canadian tunnels	350,000
To be developed by the Hydraulic Power Company	150,000
Total	750,000

The real meaning of these figures is not clear until it is remembered that Lowell, Mass., famous the world over as a manufacturing town, came into being because it was possible to develop 11,845 H. P. from the waterfalls within its bounds; that the total water horse power available at Minneapolis, renowned wherever men eat bread because of its gigantic flouring mills, is only 25,000; that Buffalo, now a city of nearly 400,000 inhabitants, and ranking fifth or sixth among the cities of the United States, uses less than 50,000 H. P., and that all the manufactories in New York State, including those of the great aggregation of cities at the mouth of the Hudson, are operated by less than 550,000 H. P. In other words, there are now planned enough hydraulic and electric installations at Niagara Falls to furnish power for a city so vast in extent that Greater New York, Paris and Chicago would be only villages in comparison.

Some there be who predict that such a city, greater than any the world has yet seen, will grow up in the immediate vicinity of the cataract.

THERE are possibilities of an increased trade in the electrical line with Japan. Several Japanese engineers, appointed by their Government, have recently returned, and their impressions as to the methods of American electrical plants were so favorable that leading manufacturers anticipate good results in the way of business from these visitors. Almost every large locomotive builder in this country, as well as electrical machinery manufacturers, have several Japanese apprentices in their shops studying American methods. This, according to the views of a prominent dynamo builder, tends to introduce American ideas in the Far East, though some merchants claim that these Japanese obtain the benefit of a practical education in this country with a view of establishing themselves in their own country after being thoroughly versed in the way of American methods of working.

Mechanical Progress.

Calculating the Power of Water.

A writer on hydraulic and milling engineering states that although for many centuries water has been employed for motive power in all the industries in which man is engaged, there are yet many people vitally interested in its use who know but little of the natural laws governing its utility, or how to estimate and measure its power.

Most practical men know something about weir dams and are able to make a comparative estimate of the volume of water available for constant power purposes, but being unfamiliar with the laws controlling the motion of fluids, are unable to calculate the working energy that a given volume of water under a given head or fall is capable of producing. This is determined by the weight and velocity of the water. The weight is an unvarying factor, a given quantity always weighing the same, but the velocity varies according to the height of column or head. The initial velocity of spouting fluids is directly as the square roots of the heights of the columns, or of the pressure. It being known that the initial velocity under a 4-foot head is 16.2 feet per second, and that the square root of four is two, we proceed to ascertain the spouting velocity of any other height by taking its square root and dividing it by two, the square root of the 4-foot head, and multiplying it by 16.2, the spouting velocity of the 4-foot head. Take, for example, a head 16 feet high; the square root of which is four, we divide it by the square root of four, which is two, multiply by 16.2, and have as a result 32.4, which equals the spouting velocity due to a 16-foot head of water.

By the same rule we find that the spouting velocity due to a head 64 feet high is 64.8, because the square root of 64 is four times greater than the square root of four, therefore the velocity must be four times greater than the velocity due to the 4-foot head. The initial spouting velocity of any other head of water can be ascertained by the same method of calculation.

Spouting velocity presents a rather peculiar phase of the water power question when thoughtlessly viewed. Measured by spouting velocity alone, it would appear that there is a relative loss of power as the height of the column of water increases. A 64-foot head is 16 times the height of a 4-foot head, and yet the spouting velocity of the former is but four times greater than the latter. It must be remembered, however, that while the spouting velocity has been increased but four fold, the pressure has been increased sixteen fold, so that against, say, one velocity and one pressure in the 4-foot head, we have in the 64-foot head four velocities and sixteen pressures, which means a marvelous increase in power instead of a relative decrease. It means that a water wheel which would develop 2 H. P. under a 4-foot head, would develop 128 H. P. under a 64-foot head. Thus it will be seen that by raising the head sixteen times we increase the power sixty-four times, a fact which seems quite astonishing to the uninitiated. It is due, however to say that, while theoretically the power is increased sixty-four times, the efficiency of the wheel under the high head is not in so great a proportion, on account of increased friction due to its greater speed.

The speed of a wheel increases with the velocity of the water, therefore the speed of a wheel under a 64-foot head would be four times greater than it would be under a 4-foot head. This brings us to another phase of the subject that must not be overlooked by the student desiring full and correct information. While the 64-foot head develops four times as much power as the 4-foot head, four times as much water is consumed in doing it. When a given quantity of water is consumed in both cases, the power of the 64-foot head is but sixteen times that of the 4 foot head, or in exact ratio to the heights of the head. To make it plainer, a given quantity of water in a 64-foot head will develop sixteen times the power that it would in a 4-foot head, because the former head equals sixteen times the height of the water.

Cost of Oil Fuel for Steam Boilers.

The trouble occasioned by the recent strike of coal miners has caused many steam users to investigate the question of the relative cost of oil and coal as a boiler fuel. Some interesting figures from C. F. Foster, who was Mechanical Engineer of the World's Columbian Exposition, are herewith reprinted from the *Engineering Record*:

In determining equivalent costs of coal and oil for various prices paid for coal based upon the World's Fair results, we can establish a formula in which the price of the oil per gallon (A) multiplied by the number of gallons burned per H. P. hour (B) plus the cost of handling (C) is equal to the price of the coal per pound (D) multipled by the number of pounds burned per H. P. hour (E) plus the cost of the handling (F), or $AB+C=DE+F$. In this case $B=.3007$, $C=\$\ 0006$, $E=4$ and $F=\$\ 00131$. $D=\frac{3\ 007\ A-.00071}{4}=\$$ per pound.

Multiplying by 2240 to obtain the cost in dollars per long ton (T) and simplifying, we have $T = 168.30\ A - .397$.

Giving A various values from 1.5 cents, to 3.5 cents, obtaining the value of T, we have the following table as showing the equivalent cost of coal per ton for oil at various prices per gallon, the evaporation and cost of handling each being taken the same as the World's Fair results:

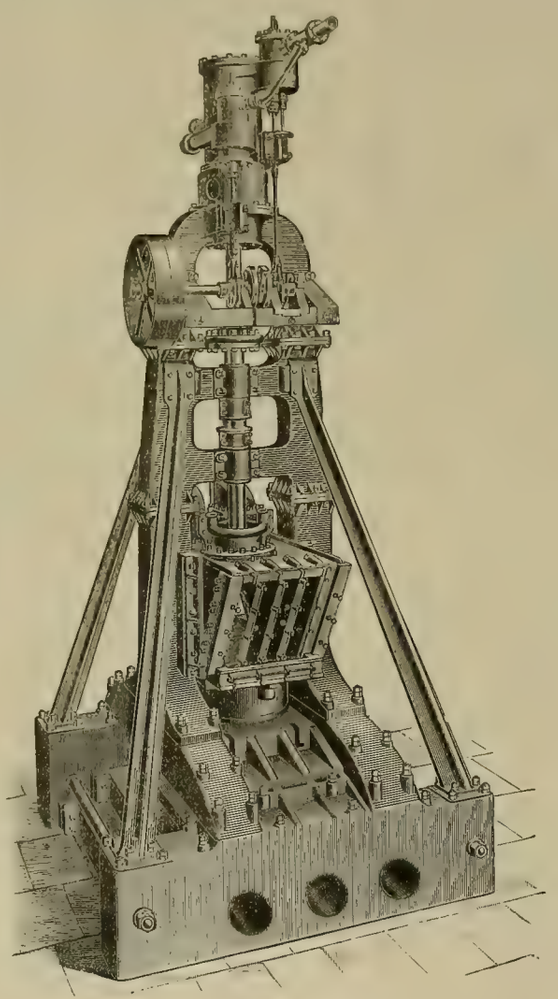
Price of Oil, Dollars per U. S. Gallon.		*Equivalent cost of coal in dollars per ton, 240 lbs., assuming the evaporation of coal to be $\frac{7.5}{14.25}$ of that of oil.*	
.015	.0275	2.12	4.23
.0175	.300	2.55	4 65
.0200	.035	2.97	5.07
.0225	.0350	3.39	5.49
.0250	....	3.81	....

From the above it would seem that in the East oil can seldom compete with coal when the question of price is concerned, but the figures cannot be considered directly applicable to California or the Pacific coast.

As far as the handling of the two are concerned, Mr. Foster found the cost of handling oil to be less than one-half the cost of handling coal. Were his figures applied to a smaller plant of, say, 500 H. P. in boilers, which would be capable of supplying a 1000 H. P. compound engine and the plant run for 300 ten-hour days, the cost of handling oil would be $900 and coal $1965.

A Steam Stamp.

Herewith is illustrated an improved steam stamp, invented by Edwin Reynolds and made by the E. P. Allis Co. There is a new form of valve gear on the steam cylinder, a complete iron frame, and the addition of a solid cast iron anvil block under the mortar bed to replace the spring timbers. The new valve motion produces a quick opening and closing of the valves, admitting steam at full boiler pressure for the down stroke, while the admission of steam for the up stroke can be regulated without stopping the machines or changing the valves. All the wearing parts are made so as to be easily removed for renewal or repairs. The machines are entirely self-contained and will always remain in line, thus avoiding excessive wear. Previous to the introduction of the Reynolds improved stamp the average output of one machine in finished material was from 150 to 200 tons of rock per day. One of these improved stamps in the stamp mill of the Tamarack Mining Co., Opechee, Mich., has crushed 1920 tons of conglomerate copper rock in six days, or 320 tons per day, through $\frac{3}{16}$ mesh screen. It is to noted that this stamp is not suitable for crushing gold ores, being designed especially for the copper ores of Anaconda, Montana, and northern Michigan.



STEAM STAMP.

THE firing of a candle through a door or pine plank need no longer excite wonder. A more striking illustration of the penetrative power of light matter at high velocity has been furnished by Capt. Cooper Key, R. A., as a result of experiments on firing gas in mines. For a borehole was employed a special gun, which was charged with high explosive, tamped by pressed cylinders of raw, dry clay 3 inches long and about 2 inches in diameter. The blasting acted in various mixtures of air, coal dust, gas, etc., and to stop the course of the plug and break it into dust a cast iron target plate 1 inch thick was placed 25 feet in front, at an angle of 45°. After three or four shots the inch iron plate was penetrated by the clay plug, weighing seven and a half ounces.

LATE experiments with aluminum show that from two to five pounds added to a ton of iron makes it grayer and softer, the slag rising rapidly and completely to the surface, and leaving the metal in a far purer and better condition than before. The iron is more fluid in the ladle and can be poured into small molds without any tendency to chill, and the formation of "waster" castings, due to blowholes, is entirely avoided. The aluminum does not reduce the melting point of cast iron or steel, but increases its fluidity by the removal of impurities. The effect of a small proportion of aluminum upon steel with medium carbon is to increase its tenacity and impair its ductility. It may also be used in the same proportion in brass manufacturing, and in larger quantities for making "aluminum brass," and as it is daily becoming cheaper the prospect is that it will in the near future be extensively used in iron and brass foundries.

Scientific Progress.

A Balloon For an Engine.

A balloon, attached to a car traveling on a single steel rail, has been found to afford ample motive power to do service on a very steep mountain side, the balloon being 65 feet in diameter and the car and contents weigh four tons. A test has been made in Bavaria. The principal feature of the new system, according to the *Scientific American*, is that the force of traction is directed vertically upward, and is derived from a balloon. A single rail is used for the only purpose of directing the course of the train and keeping the balloon with its load captive. To this end the rail is made T-shaped, and the car runs on it, gripping it from the sides and from below. The rail is anchored to the ground at distances of about 15 feet. In the descent the propelling force is gravity, and the balloon acts as a check to prevent accelerated motion. A ballast of water, taken up at the top of the mountain, provides the additional downward force required. The truck carries the water receptacle, which can be opened by the aeronauts during the journey. The truck and receptacle together weigh about 600 pounds, and when there is no wind the receptacle carries about 1100 pounds of water, making a total weight of 1760 pounds. When it is windy the strain between the balloon and the truck is diminished by letting the water out of the receptacle, thus compensating for the difference in power. The difference in weight caused by passengers entering or leaving the car is regulated by the use of separate weights, a sufficient number of which will be kept at each station.

J. J. HOLTZAPFFEL, in a paper recently read before the Society of Arts on the uses of the sand blast, alluded especially to the value of the process in sharpening files and the superiority of the process; the sand-blasted file doing twice the work of the ordinary file in the same time, this superiority being now so fully recognized that 240,000 dozen files are prepared in Sheffield yearly. They can also when worn be resharpened over and over again, without grinding out the old marks, for about 2½ per cent of their value. He also spoke of the efficacy of the blast in removing every trace of scale from iron castings so that the finest tools may be applied at once to the metal, and of its

usefulness in refacing grindstones and emery wheels, cleaning bicycle tube surface before brazing, granulating or frosting electric plate, gilding metals, gold and silversmiths' work, and jewelry, and many other purposes suggestive of a widely extended field for the sand blast in metallurgy.

PROF. MENDELOFF has advanced the theory that petroleum is of mineral origin, and that its production is going on and may continue almost indefinitely. His hypothesis is that water finds its way below the crust of the earth, and there meets with carbides of metals, particularly of iron, in a glowing state. Oil-bearing strata occur in the neighborhood of mountain regions, where it may be supposed that the dislocations of the strata afford passages for the access of water. The water is decomposed into its constituent gases; the oxygen unites with the iron, while the hydrogen takes up the carbon and ascends into higher regions, where part of it is condensed into mineral oil and part remains as natural gas, to escape where it can find an outlet, or to remain stored at great pressure until a bore-hole is put down to provide it a passage to the surface.

THE newly-discovered chemical substance, sugarine, is likely to have an important influence upon commerce in several directions. Unlike saccharine, which never became very popular, sugarine contains none of the obnoxious para acid. It is a chemically pure substance, 600 times as sweet as sugar, and yet obtainable at one-twelfth the cost. If it should prove the healthy, cheap and perfect substitute for sugar which the discoverer, E. R. Savigny, believes it to be, it will doubtless soon be utilized for domestic and industrial purposes, especially as its antiseptic properties are said to cause jams and other articles prepared with it to keep for years. The opinions of experts and the test of experience will soon show how far the inventor's expectations are realizable.

MANY of the violent changes which occur under the surface of the sea, as Prof. John Milne has recently shown, produce effects that are distinctly and sometimes disastrously felt on the land. Wherever a profound cavity exists in the bed of the ocean near the land, and wherever the border of a continent slopes off into a deep sea, great slides are apt to occur, and these often cause earthquakes. In Japan, Mr. Milne says, a large number of earthquakes came from the deep sea off the mouth of the Tonegawa, the largest of the Japanese rivers. The river brings down alluvial detritus which is deposited on the brink of a deep hollow in the ocean, and from time to time the accumulated deposit slides into the depths, shaking not only the sea-bottom, but the adjacent land.

ACCORDING to Nikola Tesla, "of all conceivable methods of generating electrical energy, nothing in the present nor in the future is likely to compare in facility and economy with the waterfall." Of all methods of generating power, the utilization of waterfall, he says, is the simplest and least wasteful. According to him, even if it were possible, by combining carbon in a battery, to convert the work of the chemical combination into electrical energy with a very high economy, such mode of obtaining power, he thinks, would be no more than a mere makeshift, bound to be replaced sooner or later by a more perfect method which requires no consumption of any material whatever.

M. ASSELOT, a French chemist, has recently compounded a celluloid that will not burn. He dissolves twenty-five grammes of ordinary celluloid in 250 grammes of acetone. He then makes a separate solution of fifty grammes of magnesium chloride and 150 grammes of alcohol and obtains a paste by mixing together the two solutions. After the volatile parts have been evaporated, he has left a celluloid that is incombustible. The discovery should be of great value, for through the inflammable qualities of celluloid it loses much of its usefulness.

Why Less Than Ten Per Cent of the Coal's Energy is Used in Developing Power.

The marvelous exhibit of boilers, engines and other machinery recently installed in some of the street railway power plants throughout the country should certainly be excellent food for thought for inventors, manufacturers and engineers and those interested in natural philosophy, affording as they do to those familiar with the subject an opportunity to judge of the progress made in steam engineering (from an economical point of view) since 1764, when James Watt completed his first perfect steam engine.

A review of the history of the steam engine from that time to the present would convince the reader that, while we have succeeded in making a beautiful and complicated piece of machinery, the engine of the day is only about 20 per cent more economical than the first engine made by Watt, and that our boilers and engines of to-day are yet very crude machines, consuming, as they do, eight pounds of coal (under the most favorable conditions) to do the work of one. With reference to the economy of Watt's engine, and quoting Lee Van's, we find: Founded on these principles the steam engines which were made by Watt, and his associates and pupils before 1830, produced a H. P. with less than two pounds of coal per hour. These engines are known as the Cornish pumping engine, and if we look into the history of these machines we will find them reported as doing one hundred millions of duty, which is a technical phrase intended to express the fact that a hundred million pounds of water were lifted a foot high for a hundred pounds of coal consumed; turning that into H. P., it means about two pounds of coal per hour per H. P. This result was produced by cutting off steam in the cylinder at one-eighth or one-tenth of the stroke, and allowing it to expand eight or ten times.

The engines of that day were, of course, very imperfectly constructed and great loss occurred from leaking pistons and from imperfectly constructed boilers.

But, notwithstanding that loss, the result was equal to two pounds of coal per hour per H. P. Reconstruct these engines, with the tools and machinery of to-day, and the result would be appreciably higher. George H. Corliss in 1858 reduced the consumption of coal per hour per indicated H. P. to 1.7 pounds coal; coal per effective H. P. was 1.8 pounds; duty, 109,979,487 foot pounds per each 100 pounds of coal. Some time later, engines and boilers built by Mr. E. D. Lewitt, Jr., consumed 1.63 pounds of coal per indicated H. P. per hour, and the duty was 11,548,925 foot pounds per 100 pounds of coal consumed.

In 1872, it appeared from a comparison of nineteen ocean steamers that the average consumption of coal was 2.1 pounds per H. P. per hour.

From data of an evaporative test made on a lately installed railway plant containing triple-expansion condensing engines and water-tube boilers, it was found to take nearly 1.4 pounds of coal to generate and maintain 1 H. P. for one hour, and this was only done under the most favorable conditions known to engineers. That any builder would install a plant under guarantee to generate and maintain 1 H. P. per hour, actual working conditions, on 1.4 pounds of coal is very doubtful, and the steam engines and boilers found in our modern power houses will cost, H. P. for H. P., ten times as much as they would in Watt's time; and so complex are these engines that should James Watt return to this earth he would know so little of steam engineering as to be unable to start them.

What percentage of the energy of coal do these engines convert into power or work? The energy of fuel or its power to do work may easily be computed by assuming a value of 14,500 heat units in one pound of coal; this is giving a somewhat high value to the coal, it being the number of heat units contained in one pound of pure carbon. (A heat unit is the energy required to raise one pound of water one degree of temperature, or the power required to raise 778 pounds one foot high.) This would give $14{,}500 \times 778 = 11{,}281{,}000$ pounds raised one foot high in one minute, as the potential energy of one pound of coal or pure carbon. A H. P. is 33,000 pounds raised one foot high in one minute, or one pound raised 33,000 feet high in one minute, or 1,980,000 pounds raised one foot high in one hour. $11{,}281{,}000 \div 1{,}980{,}000 = 5.69$ H. P. per hour, as the theoretical energy of one pound of coal; and while one pound of coal contains energy sufficient to generate and maintain 5.69 H. P. for one hour, the most economical engines in the world require at least 1.4 pounds of coal to do that work. A great part of this loss is in latent heat of the steam, which is exhausted into the atmosphere or condensed, and this loss is unavoidable as far as now known.

Latent heat of steam is the quantity of heat expressed in heat units required to vaporize or evaporate water already heated to the temperature of the steam into which it is to be converted, or one pound of water heated under atmospheric pressure from 32° to 212° F. requires 180.9 units of heat; if more heat is supplied, steam will be generated without elevating the temperature until the water is evaporated, which requires 1146.6 units of heat, and the steam volume will be 1740 times that occupied by the water at 32° F. Then $1146.6 - 180.9 = 965.7$ units of heat will be absorbed in the steam, the temperature of the latter not being raised.

This is what is called latent heat, because it does not show its temperature, but is the heat consumed in performing the work of turning water into steam. From the indicated diagram taken from a triple-expansion condensing engine where the initial pressure was 128 pounds (too low for the best economy), it was found that it was generating about 830 H. P. and exhausting into the condenser 11,900 pounds of steam at atmospheric pressure every hour. Every pound of this steam contains 965.7 heat units from which no work had been obtained, or $11{,}900 \times 965.7 = 11{,}491{,}830$ heat units lost, and, as it has been assumed that one pound of coal contains 14,500 heat units, the loss by latent heat on this engine for one hour would be $11{,}491{,}830 \div 14{,}500 = 792$ pounds of coal.—C. H. Garlick, in Scientific Machinist.

A Long-Distance Run.

A single locomotive of the Union Pacific Railroad recently covered 955 miles in twenty hours and eight minutes, exclusive of stops—an average rate of 47.44 miles per hour—and by so doing has excited the wonder of the operating departments of nearly every American railroad. J. H. McConnell, superintendent of motive power and machinery for the Union Pacific, has prepared a complete report of the performance for the *Railway World*. The train left Evanston, Wyo., at 3:50 o'clock P. M., and consisted of an engine, one baggage car and two special cars. The total weight of the engine and tender is 226,833 pounds, and of the three cars 264,775 pounds, making a total of 491,608 pounds. The whole distance of 955.2 miles was covered in exactly 23 hours and 55 minutes, or at a rate of 39.93 miles per hour. The actual running time was 20 hours and 8 minutes—an average rate of 47.44 miles an hour. What is still more remarkable about the trip is that, until the journey was about two-thirds completed, there was no attempt at fast running, the idea being to take the time of a regular train over the road. From Evanston to North Platte the special made little, if any, better time than the regular overland limited train. But just before leaving North Platte one of the directors who was on the train received a message requiring his presence in Chicago the next morning. The engineer was informed of the necessity of fast running, and was instructed to overtake the overland train at Omaha, if possible.

Omaha is 290.9 miles to the east, and it was necessary to get there by 4:45 o'clock the next afternoon if connections with an Omaha-Chicago train were to be made. The engineer "got her in there" on time—a remarkable performance when it is remembered that the same engine had previously covered nearly 700 miles. The time occupied on the Wyoming division from Evanston to Cheyenne, 438.9 miles, was 12 hours and 5 minutes, or a running time of 10 hours and 50 minutes. That division was covered therefore at an average speed of 36.32 miles an hour, or 45.51 miles per hour actual running time. Thirteen stops were made, varying from two to fifteen minutes, for water, coal, orders and meeting other trains. At Cheyenne there was a delay of 35 minutes. From Cheyenne to Omaha is 516.3 miles, and this distance was covered in 11 hours and 15 minutes, or at the rate of 45.9 miles per hour, the actual running time being 9 hours and 18 minutes, or at the rate of 55.51 miles an hour.

Just before the arrival at North Platte there remained exactly six hours in which to reach Omaha. The average rate for the distance was 59.17 miles per hour. From North Platte to Grand Island the time, exclusive of stops, averaged 61.1 miles per hour. For short distances 74 and 75 miles an hour was attained. At one point 22.1 miles were made in 19 minutes; at another 24.3 miles were covered in 21 minutes—a speed of 69.43 miles per hour. There was covered 40.4 miles in 36 minutes—an average of 67.33 miles an hour. Just before reaching Omaha 20.1 miles were made at a rate of 70.94 miles an hour. Engine 890 is an eight-wheeler and a typical Union Pacific passenger locomotive.

Some Points on Patents.

A patent may be valid for a process, and another for a mechanism for carrying on the process.

The experimental use of a machine more than two years before filing an application does not affect the right to a patent.

A *specification* should describe the patent and method of construction. A *claim* should cover the article thus constructed as a whole.

A license to a person to use an invention only "at his own establishment" does not authorize its use at an establishment owned by himself and others.

Property in inventions exists by virtue of the Federal Constitution, and no State has a right to interfere with its enjoyment or to annex conditions to the grant.

To infringe a patent it is not necessary that the thing patented should be adopted in every particular. If the patent is adopted substantially by the defendants they are guilty of infringement.

It is not sufficient to "think up" an invention, or to even perfect it mentally. The party who perfects it and puts it into practical use will be deemed the true inventor, and entitled to a patent.

A *licensee* is one who has transferred to him in writing a less or different interest than either the interest in the whole patent, an undivided part of such whole interest, or an exclusive sectional interest.

The term "useful" in the patent law is used in contradistinction to "mischievousness." A design, if not mischievous, is useful if it is attractive, and the utility consists in such a shape or configuration of a given article.

An assignee is one who has transferred to him in writing the *whole interest* in the original patent, or an undivided part of such whole interest in every portion of the United States. And no one, unless he has such an interest transferred to him, is an assignee.

When an inventor has developed his invention so far as to make a model showing clearly the workings of the invention, and some one more skilled than himself invents a machine, and thereby produces the article, he will be considered as a skilled mechanic, using

knowledge imparted to him by another, and not as the inventor of the article.

An inventor cannot safely let his invention rest in an incomplete state simply because he meets difficulties; he is not thereby excused from using all reasonable diligence in his endeavors to surmount such impediments and perfect the invention.

A grantee is one who has transferred in writing the *exclusive* right under the patent to make and use, and to grant to others to make and use, the thing patented within and throughout some specified part or portion of the United States. Such right is *exclusive* even to the patentee.

A title to a patent taken out by one of the members of a firm and never assigned to the firm will not pass with the sale of partnership property, although expenses incident to procuring the patent were paid by the firm, and the patent was used for the benefit of the firm while the partnership lasted.

THE German postoffice is experimenting with an invention—an electric typewriter apparatus, which, at a cost of $125, can be connected with a telegraph wire, which types a message off on a keyboard, and which is reproduced at the other end.

Coast Industrial Notes.

—Corral Hollow, Cal., coal is now locally offered for sale.

—A six million gallon reservoir is about to be built at Corona, formerly South Riverside, Cal.

—A road is to be built from Fresno, Cal., to King's River canyon. It is said the canyon rivals Yosemite in scenic splendors. The road is to be opened for tourists the coming summer.

—The 5 per cent bonds of the San Francisco & San Joaquin Valley Railroad, the new line, of which Claus Spreckels is president, are quoted in New York City at 101½@102. About $4,000,000 have been sold and another lot of $200,000 is shortly to be issued.

—The steamship Mariposa this week, from Auckland and Sydney, brought $1,500,000 in gold to San Francisco. Ten million dollars have been shipped from Australia to the United States in the last four months—a pretty good Klondike of its own.

—The trustees of the Los Angeles, Cal., Oil Producers' Association are considering the advisability of a shut-down of the wells. The move has become necessary on account of the lack of storage capacity and the overproduction due to prohibitive freight rates to interior points. The daily production is now about 4000 barrels and the net consumption not over 2500 barrels.

—Umatilla county, Oregon, with a population of 17,000, this year produced 5,000,000 bushels of wheat, which brought $3,750,000 in gold, or $220 for every inhabitant; and Whitman county, Wash., almost adjoining, with 25,000 population, yielded 6,000,000 bushels, worth $4,000,000, or $180 per capita. Baker county, Oregon, with but 11,000 population, is expected this year to produce $2,000,000 in gold.

—There will be twelve miles of American rails laid on the Astoria and Columbia River Railroad, beginning at Goble, Or. The English rails were not sufficient to complete the track. This new consignment is on its way from the East. The rails are of the same weight and size as those laid, seventy-five pounds to the yard, 5 inch base, 5 inches high, and 2½ inch ball. Tracklaying begins at the Goble end of the line when the new rails arrive.

—Electrical manufacturing companies of the coast have formed the Finance and Construction Company, capital stock of $500,000, the shares being divided between various electrical machine manufacturing concerns, each having equal representation in the board of directors. The principal object is the installation of electric machinery. Among the first operations of the new company will be the installation of a twenty-mile transmission plant in Shasta county.

—The annual report of the Southern Pacific Company for the year ending June 30, 1897, shows a net income of $528,505.34 in the Pacific system for the year. The gross earnings of the Pacific system were $31,274,864.68, as compared with $32,226,624.46 the year before. The railroad made that up, however, by cutting their operation expenses to $19,673,811.43, while the year before they paid $20,956,812.64 to operate the Pacific system. Number of passengers carried, earning revenue, were 19,151,558; number of passengers carried one mile, 485,207,300; number of passengers carried one mile per mile of road, 97,688.

—The sugar trust will be competed with after January 1, '98, when the five years' contract with the Hawaiian planters with the Western Sugar Refinery will expire. The trust will continue to handle that portion of the crop, from 40,000 to 50,000 tons, which Claus Spreckels can control. Of the remainder of 225,000 tons, 150,000 tons will be placed on the market by the California Beet Sugar and Refining Company. Of the 150,000 tons raw island, 90,000 tons will be sent to New York, where it has already been sold to refineries independent of the trust. The remaining 60,000 tons will be refined at the California Beet and Sugar Refining Company's works at Crockett, on the straits of Carquinez, Cal.

—Construction of a railroad line from Portland, Or., to Puget sound is now regarded as probable. The work was abandoned six years ago when the Charles Francis Adams management went out of the Union Pacific and the S. S. H. Clark management came in. In 1890, the Union Pacific, then in charge, by Adams, as president, and the Great Northern railroad, jointly undertook to build a railroad line from Portland to the Puget sound. The road was graded from Vancouver to Kalama, and most of the grading work finished between Kalama and Centralia. Comparatively little work was done north of Centralia. About $50,000 was expended on a bridge over the Columbia at Vancouver, and in all more than $2,000,000 was invested in the enterprise. It was abandoned in 1891 in a half finished condition, since when it has been sleeping.

—At Sacramento, the California Commissioner of Public Works has awarded contracts for work to be performed on the San Joaquin and the Sacramento rivers, California. The bids for dredging the Newtown shoals were thrown out by the board by reason of being too high. Dredger work on the San Joaquin for removing cut-offs 6 and 7 was awarded to J. C. Smith, of Stockton, for 4¾ cents per cubic yard; for the construction of the jetties at the Newtown shoals, Clark & Henry, of Oakland, who are to supply the piles and drive the same for $7447.97. The work of providing bags of sand and constructing brushwork which is to fill in between the piles, was awarded to Lauritzen & Hodapp for $9600. All the bids let are subject to the approval of the Secretary of War. The high bids put in for dredger work may necessitate the purchase by the board of a State dredger, which can do the work at a reduced cost.

—The Chileans, "The Yankees of South America," are moving in the matter of railways, and the Chilean government is considering an offer from a German syndicate of $35,000,000 at 4½ per cent. to be expended in building lines. This offer is a stroke of enterprise, not merely as an investment, but because of the foothold it will give Germany in South American industries. In a mountainous country like Chile, $35,000,000 will not build many miles of road, especially since the first effort will probably be to scale the Andes and establish communication with the Atlantic States, but it will build so much that more must be had in order to make the first available. In the end, it is most probable the sum will amount to $100,000,000 or more, besides which many other millions will have to be invested in equipment, and Germany will be in a favorable position to furnish all that is required. If properly conducted, the movement will be profitable to both Germany and Chile, and, though the United States may regret to see such an alliance between a South American State and a foreign nation, the United States will have nothing to say in contravention of it.

—Under date of October 20 a report is made to stockholders of the Southern California Railway Company, which was formed June 27, 1892, by consolidation of the California Southern Railroad, California Central, Redondo Beach, San Bernardino and Eastern, and Santa Fe and Santa Monica Railway Companies. These corporations had a total capital of $12,824,000 stock, $8,783,000 first mortgage six per cent bonds and $3,500,740 income bonds. This stock, in the present company, is represented by $6,752,000 common, $6,072,000 preferred; no bonds have been issued, and the property remains subject to the mortgages of the constituent companies. In the consolidation it was arranged that a part of the California Central bonds should not bear interest unless earned, making them practically an income bond. Bond issues now stand as follows: Interest bearing—California Southern, $2,056,000; California Central, $2,548,000; Redondo Beach, $108,000; total, $4,712,000; annual interest charge, $282,720. Income bonds—California Southern, $3,500,740; California Central, and Redondo Beach, $4,071,000; total, $7,571,740; additional interest charge if earned, $454,304.40; interest on both classes of bonds, $737,024.40; annual sinking funds under mortgage requirements, $92,270. No charges have been made against income on account of sinking funds since 1888. The company had a net indebtedness to the Atchison of $1,330,278. The mileage of the road is 491. For the fiscal year ended June 30, 1897, the deficiency to be provided for before payment of dividends on the stock was $818,315.23, of which $225,712.83 was deficit under fixed charges, the remainder being sinking fund and income bond interest. Physical condition of the property has been improved materially since January 1, 1896, and other necessary renewals and betterments are in progress. For the year ended June 30, 1897, a total of $149,762 was expended on improvements, and $45,027 on equipment, or $194.790 in all. Total tonnage of freight was 469,881, of which 150,964 tons, or 32 per cent, was of agricultural products; 77,360 tons, or 16½ per cent, mineral products; 74,639 tons, or 16 per cent, lumber; 90,965 tons, or 19 per cent, manufactures.

Recently Declared Mining Dividends.

Santa Rosalia M. Co., Mexico, 10 cents per share.

American G. M. Co., Colorado, 2 cents per share, $6000; Nov. 15th.

Victor G. M. Co., Colorado, 15 cents per share, $30,000; Nov. 20th.

Champion Mining Co., Nevada Co., Cal., 25 cents per share, $8300.

Elkton Con. Co., Colo., 3 cents per share, $30,000; Nov. 20,

Personal.

CAPT. THOS. MEIN is expected in San Francisco from New York City this week.

W. B. FRY has been appointed superintendent of the Hawkeye G. M. Co., Lead, S. D.

M. HODGE succeeds Benj Tibbey as superintendent of the Parrott Co.'s mimes, Butte, Montana.

P. KLINEFELTER has been appointed superintendent of the Little Butte mine, Randsburg, Cal.

T. J. NORTON of Yreka has been examining Grass Valley, Cal., properties for prospective Sacramento purchasers.

J. J. CRAWFORD, ex-State Mineralogist, on the 15th inst., moved into his new offices—1209-1210 Spreckels Bldg., S. F.

SUPT. EDDY of the Pennsylvania M. Co., Cal., has resigned. Benj. Opie was elected last Wednesday to succeed him.

GEO. A. POUNDER has resigned the presidency of the Silver Belt, B. C., Mining Co., and goes this week to the Yaqui, Sonora, Mexico.

DR. ADDISON, local manager General Electric Co., now occupies offices on the eleventh floor of the new Spreckels Bldg., 3rd & Market Sts., S. F.

A. T. HATCH, formerly California's biggest fruit grower, writes from Fort Yukon of chopping wood at $4 per cord. He expects to get to Dawson some time in '98.

R. EAMES, JR., G. M. Columbia Smelting Co, Crittenden, Arizona, has gone East for an additional smelter and to examine mining properties in North Carolina.

H. C. PERKINS, formerly superintendent of the North Bloomfield mine, Nevada Co., Cal., and who left here fifteen years ago, will return to Nevada City next month.

THOS. WITHERS has returned to Cripple Creek, Colo., where, seventy miles north of Wilcox, he put in a 100-ton mill and smelter for the Table Mountain Copper Co.

CHAS. BUTTERS says that, while a great deal of study has been given to chlorine as a dissolving agent, its use is limited as compared with cyanide, by which it is being slowly displaced in South Africa.

A. BENSON SEARLES, of Washington, D. C., is in Amador county correcting the topography of all the mining claims on the mother lode, for the use of the department at Washington. The idea is to make the topography conform to the location lines of the various claims, which now seem to be at variance, and also in the relation to the various locations to the section corners and other legal subdivisions of sections in all the counties along the mother lode. The work will take several months.

Commercial Paragraphs.

THE Colorado Iron Works reports the sale of a large reverberatory roasting furnace, to be erected in Keswick, Cal.

G. HOFFSNIDER is having a No. 3 Lightner mill, and other machinery build at Birch & Co.'s Works, San Francisco, for the Great Bear Mining and Development Co., near Redding, Shasta county.

BAKER & HAMILTON are in the market with prospectors' engines, hoists and mine working tools of all kinds. Their machinery is of the latest design and built under their own specifications and supervision.

THE Weber Gasoline Engine Co., Kansas City, Mo., report recent sales of their engines as follows: A 20 H. P. engine and pumping plant to the Texas Gold Mining Co. of Buford, Ga.; four gasoline engines, including pumping and electric light plant, to Squaw Creek mining district, near Phœnix, Ariz., for B. Reeves; one double drum geared gasoline hoisting engine, 40 H. P., and one single drum gasoline hoisting engine, 10 H. P., to the Guggenheim Smelting Co., Mexico; one 10 H. P. blowing engine to Geo. C. Updegraff, Sargent, Col.; two gasoline heavy mill engines to the M. A. Sebring Mining and Milling Co. at Benson, Ariz.; one 40 H. P. gasoline engine to operate placer mining pump to L. C. Trent & Co., Salt Lake City, Utah; two complete placer mining plants, including two gasoline engines, to W. F. Putnam of Nyssa, Oregon; two 40 H. P. gasoline hoisting engines, single drum geared, to the Consolidated Kansas City Smelting and Refining Co.; one 10 H. P. gasoline engine, hoisting, single drum geared, to the Gopher Gold Mining Co. of Chaparral, Ariz.; one 10 H. P. friction gasoline hoisting engine to J. T. McLaughlin, San Pedro, N. M.

Recent California Mining Incorporations.

Nevada County M. and D. Co., Grass Valley, Cal.; capital stock, $1,000,000; $7000 subscribed; J. P. Maleville, S. Salomon, W. L. Brown, G. Quane, E. S. Harrison, C. A. Wagner.

Midas G. M. Co., Sacramento; capital stock $800,000, all subscribed; J. H. Roberts, J. W. Roper, L. A. McIntosh, H. K. Johnson, W. F. George.

Gold Canyon M. Co., Riverside; capital stock, $500,000; subscribed, $25; G. B. Fish, D. Mitchell, C. C. Doran, E. B. Stanton, C. L. McFarland.

Alaskan G. M. and D. Co., Sacramento; capital stock, $100,000; subscribed, $3500; H. L. Look, A. E. Rudell, G. H. Clark, D. W. Carmichael.

Utica Gold Mining Company, San Francisco; capital stock, $4,000,000; subscribed, $500; Alvinza Hayward, L. W. Shinn, A. H. Winn, W. E. Sell, Thomas T. Lane, Angels Camp.

Books Received.

"*A Treatise on the American Laws Relating to Mines and Mineral Lands within the Public Land States and Territories, and Governing the Acquisition and Enjoyment of Mining Rights in Lands of the Public Domain.*" By Curtis H. Lindley, of the San Francisco Bar. In two volumes, pp. 1526; octavo; bound in calf. Published by the Bancroft-Whitney Co., San Francisco. Price $15. This work was recently reviewed herein from advanced sheets, and will doubtless meet with extensive sale as an authoritative compendium of mining law, rendered of more than ordinary value by reason of extensive annotations, references and discussion of the many questions that continually arise, and which are treated in such a way as to make this work one requisite in every mining library. It is elaborately indexed, the table of cases cited alone occupying 54 solid pages, the index occupying 130 pages, and the table of contents 15 pages. The work is admirably issued by the publishers.

"*The University Tutorial Series,*" W. B. Clive, London; Hinds & Noble, 4 Cooper Institute, New York City, previously noticed. Two books further received during the week are books I–IV, Euclid, by a teacher of twenty years experience, making the intelligent study of this geometry easy, though thorough. Tutorial Trigonometry, a working text-book on the nature and general properties of trigonometric functions, with illustrative exercises, also constitutes a valuable addition to these works on pure mathematics of practical aid to the learner. An important addition to the last-named work is a chapter on "Trigonometric Functions of a Variable Angle." These books are of unusual merit, and deserve the attention of scientific learners. Price, 70 cents and $1, respectively.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 9, 1897.

593,506.—BALING PRESS — A. Barrett, Puyallup, Wash.

593,530.—ICE CREEPER—A. R. Bradeen, Seattle, Wash.

593,511.—GAME COUNTER—Brodeur & Thayer, Portland, Or.

593,521.—BICYCLE STAND—E. Fowler, Wadsworth, Nev.

593,298.—VESSEL CLEANER—C. F. Holland, Elko, Nev.

593,299.—DUST PAN—J. Jeklin, Spokane, Wash.

593,361.—BICYCLE SUPPORT—Martha H. Mason, San Diego, Cal.

593,483.—TIRE COOLER—S. M. Mathisen, Portland, Or.

593,278.—SKATE—E. C. Moulton, San Jose, Cal.

593,542.—STEERING DEVICE—O. Olson, Gervais, Or.

593,422.—FISH CUTTING MACHINE—C. P. Overton, S. F.

593,383.—BALING PRESS—E. J. Shirley, El Modena, Cal.

593,384.—POTATO DIGGER—H. F. Thompson, Springville, Cal.

593,503.—THERMOMETER — M. L. Wilkinson, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FILE OR RASP.—Otto Olson, Redding, Cal. No. 593,028. Dated Nov. 2, 1897. This invention relates to an improved tool for eroding or cutting away surfaces, and is especially applicable to the manufacture of coarse rasps and files, but can also be used for smooth cutting tools. It consists essentially of a holder having at its opposite ends upturned screw-threaded lugs and having the sides upturned with inwardly turned edges which serve as guides or holders for a series of independent bits or cutters fitted within the holder and having grooves or channels which fit the inturned edges thereof. These bits or holders are curved in cross section with beveled edges, and by means of screws passing through each end of the holder they can be locked firmly in place. Whenever the edges need sharpening, by placing the series of wedges between the bases of the bits, the upper edges will be brought into a common plane, and in this position can all be sharpened at once.

MACHINE FOR CUTTING AND TRIMMING FISH.—Charles P. Overton, San Francisco, Cal. No. 593,422. Dated Nov. 9, 1897. The object of this invention is to provide a means for rapidly cutting and trimming such fish as dried codfish, which is afterwards made up into blocks or packages of convenient form and size for retail trade. It consists essentially of a table and bed-piece, a cutter having diagonally suspending links whereby it may be correspondingly moved into and out of contact with the bed-piece, vertical guides between which the cutter is movable, said guides extending below the table, a bar guided and vertically movable between said guides, diagonal links connecting the bar with the cutter, said links extending at an angle opposite to t ose by which the cutter is suspended, a treadle connected with the movable bar so that it and the cutter may be depressed and the spring or weights to return the parts to their normal condition. In conjunction with this is a hinged extension behind the cutter in the horizontal plane of the fixed table carrying a gauge and mechanism by which the hinged portion is tilted whenever the cut has been made so as to discharge the severed portion into a space below the table. At this point are fixed guiding shoes, so that different parts of the fish may be delivered into different receptacles at one side or the other of the table by simply moving the fish so that it will be cut at either one end of the knife or the other.

Mining Summary.

CALIFORNIA.

Butte.

At New Cherokee the Gage-Wilson Company have started a raise in their incline tunnel, and expect soon to tap the "rotten boulders" at that point. The main tunnel will be run 200 feet farther, when another raise will be run and the work of drifting out pay dirt will commence.

A new mining company has been organized to develop mining property at Centerville. Fifty acres of gravel are held by the American Gravel Mining Company, which can be mined by hydraulicking. It is proposed by the new company to construct dams in the ravine for impounding debris. There is an abundance of timber at hand for that purpose.

Calaveras.

(Special Correspondence).—At Angels the Utica Company are erecting a gallows-frame on the cross shaft of the Stickle mine, and contemplate sinking an additional shaft on the Mattison Gold Cliff mines. The company are operating sixty stamps on the Utica, sixty on the Stickle, forty on the Mattison and twenty on the Gold Cliff. At the time of the late fire the Utica and Stickle were both flooded with water, which stopped the sinking of the Stickle south, or cross shaft; this will now be renewed and the shaft put down to 1500 feet. In addition to their mines, the company own the Union Water Company ditch, which supplies all of their mines with water for power and milling purposes; the chlorination plant, the largest in the State; the electric light plant, and contemplate putting in an electric power plant either at Murphy's or on the Stanislaus river. In addition, they own the large company store, mine hospital, and have an arrangement with the company physician and undertaker, so that they are able to take care of their employes from the cradle to the grave. At present the Utica and Stickle mills are running on ore from the upper levels. Once the cross shaft gets down to the rich Stickle ore shoot, the old-time large output will be resumed. The property, as is well known, is owned and operated by Alvinza Hayward, the Hobart estate and C. D. Lane.

The *Last Chance* mine adjoins the Stickle on the south and is the property of George Tryon, who has a shaft down 80 feet in a 30 to 40-foot vein and levels run. South of this mine is the *Tryon*, C. Tryon, superintendent. The shaft is now down 325 feet, with crosscut at the 300 level, showing a vein 24 feet wide of $2 to $12 ore. He will erect a 20-stamp mill in the spring.

Bolitho, A. N. Butts, general manager: This mine is south of the Tryon. The property is developed by a crosscut tunnel from the east, showing a vein 125 feet wide, while a drift is run in on the footwall, with crosscut from its end, showing a vein there 47 feet wide. There is a shaft down 300 feet, with crosscut run to the vein. Mr. Butts will now start another shaft. The mine covers 3000 feet on the east veins of the mother lode.

Drakes Properties, Limited, Leopold Meyer, general manager: This property embraces the old Tryon ranch, and other ranches to the east of it, and is situated southeast of the Stickle mine. The property is being developed by two shafts. That on the Ghost is now down 395 feet and will be continued on down to 1000 feet. An additional shaft is now started south on the Dead Horse vein. As these mines are developed an interesting question will be determined. Mr. Meyer holds that, as the title to the land to the north of him is townsite and that to the west agricultural, and his patent is also agricultural, all of the ore bodies to the north that come into his ground in depth, through his north end line, and all of the veins to the west, as well, will become his property as soon as they cross his line. This side line question in "agricultural" sections is destined to give the mining attorneys some princely fees.

Lightner, G. Maltman, superintendent: The Lightner adjoins the Utica on the north. The shaft is now down 300 feet and sinking; a crosscut 46 feet east is all in ore, of an average value of $4. They will erect a 20 stamp mill at once. At this time they have a friendly suit with the Utica Company to determine the amount of ore extracted, if any, by the Utica Company in operating their mine.

North of the Lightner is the Coleman, which is idle; to the north of the Coleman is the Bovee. This mine has been in operation by Mr. McKay, but is shut down at this time. It is the belief of all who know the history of this mine that it contains a second Utica, and only needs depth to prove it. East of the Bovee is the Great Western, Baumhoffer & Seibert, owners. The shaft is down 125 feet on a 6 to 12-foot vein. The stamp mill is about completed. Between this mine and the Stickle is the Hog Pen mine of Thos. Peachy, now down 40 feet, with vein 6 feet wide of ore that shows visible gold very nicely and that, Mr. Peachy states, will go $30 the ton.

On the north of these mines is the Keystone, now being developed under bond by C. S. Lillie. The shaft is now down 120 feet, with crosscut going to the vein that crops about 75 feet to the north and is locally known as the Dead Horse vein. Parallel with this mine are the mines of the *Curtiss Con. Mining Company*, covering 3300 feet on the veins, with five shafts sunk, showing ore values of $4 to $7.23 a ton. North is the Black Oak of A. N. Butts, which Mr. Butts will develop. South of Angels is the Tullock mine, now idle. Parallel with it is the *Santa Anna*, C. J. Steedman, general manager. Mr. Steedman has retimbered and straightened the shaft, which is now down 430 feet; crosscuts to the vein show it to be 12 feet wide; and installed a 150 H. P. air compressor, built by Demarest & Fullen of Angels, who are also building a large Corliss engine for the mine.

At Carson there is nothing doing. Attorney General Hart has made the trustees of the Carson Creek mines a proposition to take the mines and pay them a certain per cent of the gross output until their claim is satisfied, which will, no doubt, result in the reopening of the mines. They have a large and complete plant, with shaft down over 600 feet on the largest ore body in this section. While the ore is low in grade, it only needs a good manager to make it pay handsomely.

Leaving Angels and driving to San Andreas the first mine being developed is that on the Bunn ranch by the California Exploration Company. The shaft is now down 330 feet, with crosscuts driven showing the vein to be 5 to 15 feet wide.

South of the Bunn and the Thorpe is the *Demarest* mine, owned by Demarest & Fullen of Angels. The property consists of a mineral location 1100 feet long and an additional mile of ranch adjoining. The shaft is down 120 feet on a 5-foot vein of ore that has an average value of $50 a ton on the surface and mills $7 to $12 in depth. The owners are now erecting a 10-stamp mill and preparing to develop the mine.

The *Thorpe* mine, W. T. Jones, superintendent: This property embraces the old Thorpe ranch. The shaft is now down 700 feet on a vein 12 to 14 feet wide. The property is about to pass into the hands of the California Exploration Company. North of the Thorpe is the ranch of J. H. Wells, at Fourth Crossing, who has sunk a number of shafts on the Thorpe vein that prospects very fine in visible gold. The vein crops strong, showing 50 feet of vein matter. The work done seems to have been done more with a view of securing a good dump than a good ore body. A shaft on the ore body showing should develop a good property. North of this vein a tunnel has been driven 225 feet in mineralized slate to crosscut a vein that covers the entire summit of the hill with its croppings. The tunnel has still 20 feet to go to cut the vein proper.

San Andreas: The principal operator here is the California Exploration Company, W. L. Honnold, superintendent. In addition to its mines in other sections, the company are now developing the *Gottschalk* and *Gold Hill* mines, near San Andreas. On the Gold Hill the shaft is now down 300 feet on a vein 6 to 8 feet wide. The work is here done with a gasoline hoist. At the Gottschalk the mine is developed by a crosscut tunnel, at the end of which the shaft is now down 255 feet, making the vertical depth from the surface 455 feet. The vein runs from 3 to 8 feet in width. The most interesting feature about this mine is the electric hoist installed by the Abner Doble Company. Its action is as light as that of a stop-watch, while the speed is rapid, and the work in every way satisfactory to the superintendent.

Going north the *South Paloma*, with Mark B. Kerr, superintendent, is the next mine of interest. The shaft is now down 700 feet, with crosscut driven 65 feet to the vein, which is here 4 feet wide. Mr. Kerr states that they will now continue the shaft to the 1200 level. To the north of the Paloma is the *Gwinn*, F. F. Thomas, superintendent. It was clean-up day, and the pan full of gold would indicate that the Gwinn is a much better proposition than generally reported. The shaft is now down 1461 feet. Mr. Thomas is opening up the 1200, 1300 and 1400-foot levels. The vein in the north end is 10 feet in width, at the south end 25 feet wide. Mill is of forty stamps. At this time Mr. Rix is starting an air compressor plant of 500 H. P. This will be used to develop the south end of the mine. The compressor will be driven by the waste water of the mill and hoist, the air being returned through 6600 feet of pipe.

Away from the mother lode there is a placer mine operated by Alvin Lunberg, near Vallaceita, and the Central Hill placer mine, near Murphy's. To the north of Sheep Ranch, the old Page-Cutting placer is being worked by Rigney & Co. West of Mokelumne Hill, the Hexter drift gravel mine is being developed by tunnel. To the east of the Hill the *North Star* drift gravel mine, P. L. Shuman, superintendent, covers three miles on the channel. The gravel is worked by ten stamps and one Cox pan. At the time of my visit the mine was under examination by Mr. Farish of Denver. Ten miles S.E. of Mokelumne Hill, on Tunnel ridge, is the *Eclipse* drift gravel mine, J. F. Siegler, superintendent. The mine is opened by a bedrock tunnel 500 feet in length; the channel is 150 feet wide, while the pay streak is 3 to 5 feet next to the bedrock. This gravel yields $1 to $10 to the car of one-half ton.

East of Mokelumne Hill, on the east wall of the mother lode, is the *Esperanza*, or old *Boston* mine, P. Ely, superintendent. The shaft is down 700 feet, and, going to the 800, will be continued on down to the 1000. The ore in the shaft is rich in visible gold. The vein, where crosscut, shows a width of 45 feet; vein matter carries an average of 3 per cent of $75 sulphurets; 30-stamp mill running on the mine. To the north is the Monte Carlo, of Col. W. T. Robinson, now being opened.

On the back vein, the *Collier* mine, east of Murphy's, is now in its old-time rich ore, with Perry Condit in charge. On Six Mile a Mr. Spencer is developing, under bond, the Taylor mine. He is also opening the Taylor mines on San Domingo and San Antone creeks. At Murphy's Naylor Williams and Lewis Lane were operating the old Mexican mine and running a 5-stamp mill on the same. F. McNear has bonded the Buckhorn mines and has let a contract for their development. His work so far shows a 2-foot vein of $15 ore on a chute 300 feet long.

There is nothing doing in the old Calaveras group. Sheep Ranch is also closed down. A few small mines are being developed near El Dorado. Fenberg & Smith have purchased the *Greek* mine, near Wiggin's sawmill, and are putting up a 5-stamp mill.

At Railroad the old Petticoat mine has been sold to L. Rosenfeld. The vein is reported as 3 feet wide with the ore value $50 to the ton. In the past the chutes were thought to pitch south, and when they were not found south the mine was abandoned. The work done on the Petticoat shows that in that mine the chutes go north, and may explain why Railroad has been condemned without just cause.

To the north of the Petticoat is the Keystone, E. C. Loftus, owner. This mine has been worked for over twenty years past for a distance of 1100 feet along the vein—the ore worked in an arrastra and giving a return of from $35 to $65 a ton. Mr. Loftus has a 3-stamp mill on the mine and water power hoist. The shaft is down 275 feet on the vein, with levels run at 200 feet, where the vein's fissure is 3 to 6 feet wide.

There remains for the investor a large field on the mother lode. Undeveloped river channels cross the county in every direction. Where opened, they have paid to work. From Murphy's north extends a contact vein that can be traced for over fifteen miles. No work has been done on it. It lies between porphyry and limestone and is capped with limonite that assays well in places. While good mines do not grow on the bushes in Calaveras, there are still a number of promising locations awaiting capital to develop.

E. H. SCHAEFFLE.

Murphy's, Cal., Nov. 6th, '97.

Philip Deidesheimer has associated with him P. A. Finnegan of San Francisco to work the Maloney mine in Hawkeye district.

El Dorado.

Nugget: At the Gentle Annie mine they have completed the station at the 400-foot level and are crosscutting for the ledge. The shaft of the Pocahontas mine has been newly timbered to the 400-foot level and the ore chutes are being put in.

Excellent progress is being made at the Grand Victory mine in sinking the shaft below the 300-foot level. They are also crosscutting at the 300-foot level, with very favorable results.

The shaft at the Griffith is being enlarged preparatory to putting in new hoisting machinery capable of sinking 2000 feet.

Kern.

The railroad is out four and a half miles from Kramer, and graded fourteen miles.

At Johannesburg a new 10-stamp mill is under construction.

Mariposa.

(Special Correspondence).—Two strikes of rich ore have been made during the past week on the Porter properties, situated on the west vein about two miles southwest from Coulterville. Early in the week the shaft at a depth of 40 feet encountered nearly 5 feet of $20 ore, while a streak of about 8 inches on the foot and a similar streak on the hanging wall will run nearly $1000 per ton. A few days later, in a tunnel which was being run on the ledge toward the shaft, there was found a body of 18 inches of quartz assaying $500 per ton. This latter body is on the footwall, about 300 feet from the mouth of the tunnel and some 150 feet from the shaft. The drift has since been run about 25 feet into the chute, which seems to be slightly increasing in size. The rock is identical in appearance with the rich ore found a few years ago in the Tyro mine, adjoining on the north, and also with the specimen rock of the Merced Company's Malvina. The property is being operated under bond by Francis H. Hill (the price is said to be $12,500) and includes 320 acres and nearly a mile in length along the west vein. It is announced that the deeds, which are in escrow, will at once be taken out by Mr. Hill.

The Merced Mining Company are erecting a large air compressor at the Mary Harrison mine.

At the Virginia all the men who can be crowded on the work are building the mill and dam.

The additional stamps at the Louisiana mine were started up last week.

Mariposa, Nov. 15th, '97.

Nevada.

The new machinery recently introduced into the 1700-foot level of the Providence mine was successfully started last Wednesday. The company will continue sinking and opening up new levels.

The *Transcript* says that the Champion company have completed the purchase of the Delhi and St. Gothard quartz mines at Columbia Hill. It is stated that the Champion company will next spring reopen the tunnels.

A new style of quartz mill is to be introduced in Nevada county. It is an English patent, for which great things are claimed and which is used in quartz mines owned by some English corporations in South America. It is to be located on the Lucky Boy quartz mine, two miles south of Grass Valley, which has been purchased from Adams & Cook by Desborough & Co. The ledge in the Lucky Boy shows free gold. Mr. Desborough and his associates expect to expend $5000 next spring.

Correspondence *Transcript*: There are four great quartz lodes in our county, the first or lower one being the North Star and Allison Ranch lode on the west side of Wolf creek. Next comes the Eureka-Idaho lode from footwall to the Lucky and Cambridge mines, with its series of rich ore shoots, many as yet hardly touched, notwithstanding that these two great and rich lodes have produced in gold in forty-eight years $105,748,407. Then comes the Providence-Champion lode, from Town Talk to the La Suerte, which has produced, excluding Gold Flat, $72,000,000 in gold, and great portions of the lode remain untouched and unexplored. Many of the mines now being prospected will yet compare favorably with the great Providence and Champion mines. All that is needed is capital intelligently applied. Of course, there are hundreds of mines, and some good ones too, outside of these great lodes scattered throughout the county.

On the mother lode at the St. Patrick mine there are two tunnels, one above the other. The upper tunnel has been run across the lode 167 feet and shows 92 feet of ledge, pure quartz. The lower tunnel has been run in 270 feet and is 40 feet in ledge quartz not mixed. There was treated by mill process 500 pounds of this ore by George Bingay of this city, which yielded well in free gold. The sulphurets, of which there was 13 pounds, assayed $744.12 per ton. This is a giant shoot of ore, and with depth will undoubtedly make a gold mine. On the next claim to the south a tunnel has been run on the lode 100 feet or so. The ledge looks well. Several years ago an arrastra was used on this claim with good results. Directly opposite the town of Washington, at the El Capitan and Honest Frank, three tunnels have been run. The first tunnel ran through the ledge for 100 feet. Some of the ore milled $5 per ton and the sulphurets assayed $100 a ton. The mine was bonded to a French company and soon afterward work was stopped. Another tunnel was run south for 400 feet, but was too high. Still another tunnel was run 200 feet and cut through the rich stringers of quartz and slate, which assayed well in gold and showed about the same character of matter as is found in the mother-lode mines of Amador and other mother-lode counties. It is the intention to run another tunnel 400 feet deeper and 800 feet south of the present lower tunnel. This, from indications, will cut the great ore shoot where all the stringers and mineral feeders from both sides will be in place, forming 100 feet of rich ore. The cost to do this, compared with the reward, is a mere song.

The next mine south is the Giant King, with its two tunnels, cutting in the upper tunnel an ore shoot 120 feet wide. The shoot of ore has been traced south for a distance of 750 feet into the Giant Queen ground, and is a discovery that will no doubt lead down into the main ore shoots. The point of discovery is 120 feet south of the Giant King south line and 150 feet east of the lode line. Somebody will take hold of these now idle mines some day and make vast fortunes out of them, besides giving employment to hundreds of men and benefiting the whole county.

At the California the long tunnel has struck into the fissure, which is nearly 100 feet wide and filled with a series of pay shoots.

The Eagle Bird is still a good mine, notwithstanding the fact that it has produced $900,000.

Considerable work is being done along the river mines, but in nearly every case it is want of confidence and actual lack of capital. Where it would take $25,000 to insure success in a good gold quartz mining venture they expect to win on $10,000 and $15,000. It is the same old story—didn't put in enough to make it a success. That is the real cause of many failures in mining ventures.

Telegraph: The W. Y. O. D. mine is looking better now than it has looked for the past four years, and the twenty stamps are kept running night and day on more than average milling ore. Tuesday afternoon the mill was successfully started on its run with electricity.

Transcript: At the Texas mine the new three-compartment shaft is down 100 feet. The new hoisting and pumping rig will be started up by Dec. 1.

Placer.

Colfax *Sentinel*: The Gold Run Gravels Co., at Gold Run, are making extensive preparations for the coming season's run. They will operate two hydraulic monitors, tailings to be impounded in an accepted dam across Canyon creek. The 10-stamp mill that will crush gravel from the drift tunnels will be ready to start in about three weeks. During the summer this company has expended about $25,000 in building new flumes and repairing the ditches which convey their water supply. The company ditch is about twenty miles in length, with a carrying capacity of 2200 inches. The water is taken from the South Yuba river 3½ miles below Cisco. Five miles below, at Birce & Smart's mill, it is dropped into Bear river, conveyed six miles, and taken from Bear river to Gold run in the Bear river ditch. The company expect to employ forty men during the winter.

Plumas.

R. K. Lodge of Granite Basin has developed his mine by a tunnel and shaft; has tapped the ledge, showing it 1½ to 2 feet wide, and the rock will pay.

The Debris Commission has granted to the Miocene Mining Company permission to operate its placer mine near Crescent Mills.

San Diego.

Union: The Ranchita and North Star mines at Banner are being deepened, and drifting is also in progress. At the Alpha, owned by Dr. Stanley and Samuel Reeder, the men are drifting on two ledges which were encountered in the tunnel. The Elevada is in good ore in a drift about 80 feet from the 200-foot level.

At Hedges the 100 stamps may be increased to 140. Ex-Governor Markham has purchased a number of properties of which the principal mine is the American Girl.

Shasta.

(Special Correspondence). — The National Consolidated, owned in San Francisco, nine miles northeast of Redding, in the Rich Gulch district, have a new 10-stamp mill, concentrators and canvas plant in operation. Their tunnel is 785 feet; the main shaft, from the tunnel, is 100 feet, at the bottom of which a drift runs in two directions, all on the ledge, which is from 3 to 5 feet. There are eight claims in the group, water right, electric and steam power. The ore is high grade. Geo. Schmitt is president and general manager.

S. S. Stickler and two others have a crosscut tunnel 200 feet on a 3-foot ledge in a porphyry and slate formation. The ore is medium grade and the sulphurets are in good proportion. The same parties are doing development work on four properties.

Buckeye, Nov. 13, '97.

Bell & Scranton are developing four claims four miles from Shasta. They have two tun-

nels and a winze. The ledge will average 2 feet of high-grade ore.

Iler Brothers, four miles north of Shasta, have nine claims. In the 600 level they have a 10-foot ledge, which they claim gives an average assay of $26.85 per ton. It is rich in sulphurets.

Shasta, Nov. 12, '97.

Within ten miles of Redding, at Hart and Whitehouse, there is great activity in the mining industry. Both places are in a beautiful basin and within a mile of each other. The mines are strung along in a semicircle on the mountain side.

The Texas Consolidated, commonly known as the Hart mine, in porphyry and slate walls, has a vein 8 feet wide. The ore is carried by rope tramway about one mile to the mill on the banks of the Sacramento river. Passenger and freight traffic is conducted in the same method across the river to the railway station. There is a 20-stamp mill, operated by electricity, eight concentrators and canvas plant.

The Central mine, owned by an English company, ships forty tons of ore per day to Keswick, carrying the ore across the river by rope tramway.

The Spanish is preparing to ship ore to Keswick. R. G. Hart is manager of the three aforenamed properties and principal owner of the Texas.

The Mammoth has a main 1000 feet, 300 feet from the surface, and ships thirty tons per day to Keswick, delivering the ore by rope tramway across the river at the railway station. S. W. Cheyney is the manager.

Panther & Litch own the Evening Star Consolidated, comprising three claims. They have 900 feet of tunnel in a porphyry formation, and an 18-inch ledge. They ship their high-grade ($500) ore to Selby and their second-class ($60) to Keswick.

Hart, Nov. 13, '97.

(Special Correspondence).—D. W. Thompson is developing two claims two and a half miles from the town of Keswick on the line of the Iron Mountain Railroad. He has four ledges, 2½ to 4 feet wide, in an iron and porphyry formation. Assays from the ore in the surface cuts run from $2 to $16.

D. Pessenti is working on five claims adjoining the Thompson claims. He has a 60-foot shaft and 200-foot tunnel on the ledge, on one claim, and a 90-foot tunnel on another claim. The ledge is about 18 inches, in a good grade of ore.

McCarthy & Carlson have five claims one-half mile above the smelter. They have 400 feet of tunnel on a 4-foot vein of medium grade ore. The formation is quartzite and porphyry. They are building railroad connection with the Mountain Copper Co., with whom they have contracted to furnish thirty tons of ore per day to the smelter.

J. B. McLaughlin, the druggist at Iron Mountain, has an 80-foot tunnel on a 4-foot ledge at Copley. The ore will go to the smelter.

Searchlight: Litsch & Panter are driving a tunnel to tap their ledge, and are also shipping ore to the smelter at Keswick. Hitherto they had hauled to Redding and thence shipped by rail, but now they are using the Central cable, under lease to R. G. Hart, Sr.

E. W. Brackett, at the Mount Pleasant mine, three miles west of Redding, is sacking ore for shipment to Keswick. The ore gives a better pan prospect than any yet shipped, and of all the cars delivered at the smelter not one has gone below $16 net per ton, and from that up to $57.

Sierra.

At the York quartz mine, Slug canyon, the new quartz mill is completed and only a shortage of water will delay crushing. Twenty men are at present employed by Supt. Copeland.

Siskiyou.

(Special Correspondence).—The Schroeder Consolidated Mining Co., nine miles southwest of here, whose 10-stamp mill was destroyed by fire about a year ago, is erecting a 20-stamp mill. On the 1200-foot level the ore body is over 100 feet wide, which bears sulphurets in value throughout of from $3 to $4, and a 4-foot ledge that yields $132 per ton in free gold. The formation is porphyry.

Yreka, Nov. 15, '97.

Two new quartz mills are being erected within two miles of Hornbrook, one on the Norfolk ledge and the other on the Lodi ledge. These mines were worked in early days by McConnell & McMannus, John Daggett and others, but have been abandoned for years and are now to be opened up again. I. O. Jillson is putting up one of the mills, being connected with Capt. Roberts of Sacramento. The other mill is being erected by LaFlesh & Martin.

The Spengler Bros. have their extensive flume at the mouth of Humbug creek nearly completed for winter sluicing. The flume is 40 wide and 40 inches deep, three-fourths of a mile long.

The Blue Gravel mine has been closed down temporarily owing to a shortage of water. On last Tuesday workmen struck the tunnel in the old mine, which flooded the miners out.

At the Spencer quartz mine men are at work on the tunnel. It is slow work and will take some time before they strike the ledge, as they are digging through a formation almost like iron.

At the Siskiyou mine on Klamath river, near Happy Camp, the owners will put in an electric light plant, so that they can work night and day during the time they have water.

Trinity.

The Grattan Mining and Improvement Co. have begun operations on a placer claim on the North Fork of Swift creek, 2½ miles west of Trinity Center. They are working in good pay gravel.

At Cinnabar there are now about 40 feet of water in the Altoona mine, which is rapidly being lowered. As soon as the water was lowered to a depth of 5 feet, the 9000-lb pump had to be lowered that distance before pumping could be resumed. The company expects to increase its force to seventy-five men by Dec. 1st. During the season J. Porter has delivered at the mine 5000 cords wood and 500 M feet lumber.

Tuolumne.

One who claims to be familiar with the Santa Ysabel mining property says: "The Santa Ysabel mine has three shafts and a fourth is now being sunk. Shaft No. 1 is an old shaft not now worked. No. 2 has the Mascot vein and No. 3 the Knox & Boyle vein. This latter one is the principal vein. Years ago it was worked in a crude way to a depth of 150 to 200 feet and ore was taken out valued at $50 to $65 a ton, but an intrusion of slate was then encountered, which at that time was thought to end the vein. When the present management took hold of the property it cut through this slate deposit and found the vein. Assays of the ore showed it to be worth $25 a ton. After discovering the value of this vein, work was stopped in order that other veins could be worked and the full value of the property demonstrated. It was from the Mascot vein that a preliminary mill run test showed the value of the ore to be $16 a ton. The Mascot vein is very irregular, and it was from a lean part of the vein that a second preliminary test—not a full mill run—of 300 tons showed the ore to average but $8 a ton. It was this test that has caused some disappointment in the property, but Superintendent Newcomb, who was recently in Boston, expresses great confidence in the Mascot vein. Should the Mascot vein prove still more discouraging, there is the Knox & Boyle vein to fall back upon. An increase in the floating debt of from $40,000 to $50,000 was incurred by the erection of the stamp mill, installation of machinery and development of the mine. The directors are considering the question of caring for this floating debt. It is held by friends of the property, and it will be taken care of without detriment to the stockholders. Santa Ysabel was put on the market at $5 per share, the par value, and the stock is non-assessable."

General Manager Buckminster states that the latest advices from the property are as follows: "Work on the No. 4 shaft is still suspended pending the placing of the hoist. The Central ore chute, as shown up by the No. 5 crosscut, is about 4 feet wide and of a very high grade of ore. One foot of this quartz laying at the footwall is very rich and assays $500 50 per ton. From the same sample $395.50 was obtained by an amalgamating test, the gold amalgamating freely. The percentage of sulphurets in the ore is about 7-10 of 1 per cent. This is the most important showing we have ever had. We have never had anything like this above the No. 3 level, which means much. We are doing all we can to open up this body of ore. Expect in a day or two to have sufficient water to run ten stamps."

Sinking on the Ready mine continues. There are twenty men working in the Lady Washington mine. Sinking continues at the Grizzly mine.

NEVADA.

The men employed by the Boston & Nevada Copper Company on the mine recently purchased in Santa Fe district have discontinued work, the ledge as far as worked not being sufficiently high grade.

A. C. Cleveland is locally credited with ability to make $150,000 by the sale of the Grey Eagle and Star mines in Cherry Creek.

The De Lamar mine is now producing 9000 tons of ore monthly.

The *Lode* says the De Lamar company, under the new arrangement for the transmission of its gold bullion, will deposit it in a safe weighing 500 pounds and send it direct to Salt Lake.

Tuscarora *Times-Review:* Work at the Independence jigs has been suspended for the winter. The work had passed the experimental stage and was a pronounced success. The difficulty of keeping the water from freezing and the cost of fuel at present renders it impossible to run the plant during the winter months.

Supt. H. C. McTerney of the Eureka Con. M. Co., Eureka, reports: "During the year ending September 30th, 1897, we have shipped to the Salt Lake smelters 1121.25 tons tribute ore, 15.51 tons company ore from the mine, and 69.55 tons of material from the surface dumps. Most of the ore shipped was from the surface workings and tunnel on the west side of the hill, all the work having been done by tributers."

The *Sentinel* says that the ores now being shipped from Eureka average 60 per cent in gold.

For the year ending September 30th, '97, the McEllin mine, near Hamilton, produced $25,013 for its owners from 418 tons of ore.

OREGON.

Baker City *Democrat:* Shipment of ore and concentrates from Sumpter over the S. V. R. R. to this city, thence over the O. R. & N. to the smelters, is becoming a big item. The heaviest shipments are made by the E. & E. mines at Bourne, but all the other mines contribute largely. The North Pole and Columbia and Bonanza are the other large contributors.

F. S. Baillie, manager and one of the owners of the Columbia mine, says early next spring his company will commence the enlargement of the mill plant to forty stamps.

W. J. Connors, owner of the California mine in Cable Cove, reports the machinery of his mill plant in place and ready to drop stamps. He is finishing the covering of a 3000-foot ditch which will convey water to his mill. Covering of the ditch will prevent the water freezing in winter. Another week will see the mine in full operation.

The Nilson quartz mine and the adjoining Gordon mine, near Baker City, have been sold to Walker & Jones of Cripple Creek.

WASHINGTON.

The Republic mine, Eureka camp, Colville reservation, shows value under development. Thirty men are employed. The flume for the mill is completed. It is 10,000 feet long, and will give the company 100 H. P. The ore is partly free milling, and it is probable that a combination plant will be put in. P. Clark is superintendent.

BRITISH COLUMBIA.

There are thirty-five mines in the vicinity of Rossland which use steam plants that cost in the aggregate $370,000. The Le Roi heads the list so far as size is concerned. Early in the present year it installed a 40-drill compressor, which was necessary in order to increase the output of the mine. The mine is equipped with a 200 H. P. hoist, an electric light plant, tramway, and large crusher and other machinery. This requires 500 H. P. boilers. The plant cost $150,000.

ALASKA.

John D. McGillivray is at Circle City, and in a letter to the *Herald*, says:

"Hydraulic mining is to be attempted on a large scale in the Minook Creek district next spring and summer, as is evidenced by the fact that a company composed of Seattle and San Francisco capitalists has sent prospectors and agents into the country to locate claims and buy tracts of land.

"As the claims are held now—generally 500 feet in length—it would be impracticable to work them separately, but under one ownership a large number of claims would pay for bringing in water and laying the necessary pipes. By the present method of working only the richer pay streaks are taken out, and in most cases this is only about an eighth or a tenth of the width of the whole of the gravel of the creeks. If these gravels are worked by hydraulics, in many cases it would pay well to work all the gravel.

"There is no law here but miner law, but under that one must walk straight as far as honesty goes. All last winter, with a thousand miners who came to have a good time, and with all the idleness and drinking and gambling, there was possibly as little fighting and less crime than in any other city in the United States of its size. There were two murders, but the men concerned had no place in this community. The Miners' Association is feared more by the evil-doers than any laws or courts elsewhere. To be sent down the river in a small boat is worse punishment than imprisonment. The law is that a pistol must not be carried in Circle City. It is miner law, and is therefore obeyed. None but miners may join the Association, but all may ask its protection.

"The season's work in the Birch creek mines is about over, and the yield of the number of men in the district is large. It will exceed $500,000, and possibly will reach $600,000, according to conservative estimates. Of this sum $80,000 comes from one mine and $60,000 each from two others, all on Mastodon, a tributary of Birch creek. About a dozen other mines on the same creek produced from $4000 to $15,000 each."

Record: The Treadwell Company is constructing a new railroad track along the beach between the Douglas sawmill and the chlorination works. The company has begun active operations on the new 300-stamp mill, which will be located near the chlorination plant. Work has also begun on the 100-stamp mill on the Alaska United Gold Mining Company's claims.

THE KLONDIKE.

The collector of customs for British Columbia and the N. W. T. has been consulted on some doubtful questions and the information below is believed to be correct.

The bonding stations on the routes to Dawson City are Leonora, 110 miles north of Fort Wrangle on the Stikeen river; Lake Taggish, seventy-two miles from the coast on the Dyea and Skaguay trails; Fort Selkirk on the Pelly river, on the Dalton trail and Cudahy or Dawson City on the Yukon. Parties desiring to go through Northwest Territory into northern Alaska, cannot take their goods in bond, neither will there be any refund made of duties paid on such goods, and while this matter has been considered by the Dominion Government, it is not probable that there will be any change in this law for the present. Invoices of goods should be produced in duplicate when they are purchased, and collections will be made in accordance with prices therein named—not on the value of the goods where the collection is made. On most goods subject to ad valorem duty, the weight of the receptacle is included and assessed the same as the contents. The exemptions are: Miner's blankets, personal clothing in use, cooking utensils in use, 100 pounds of food, sled, wagon or sleigh for the transportation of your own outfit, and a reasonable amount of tools for prospecting or mining. The "blankets and cooking utensils in use" does not mean just what articles the miner may require for immediate use, but a sufficient quantity to make them comfortable for a reasonable time. Officers will use their own discretion in exempting the 100 pounds of food, endeavoring to strike an average, and exempt accordingly. Miners will be allowed a sufficient number of horses or other animals free to transport their goods. All kinds of machinery imported exclusively for the reduction, mining and smelting of ores, free.

The duties on the most important articles are: Flour, .60 per barrel; bean, .15 per bushel; bacon, .02 per pound; coffee, specific, .02, ad valorem, .10; baking powder, .06 specific; cornmeal, .02 ad valorem; candles, .25, ad valorem; meat and meat extracts, .25 ad valorem, and tobacco, .50 specific.

On the 17th ult., a party of railroad engineers, supposed to be sent out by the Northern Pacific railroad, arrived by the steamship Rosalie, at Taiia, and ran a line from Taiia to Lake Lindeman, twenty-seven miles; and supplies began to arrive for a railroad, railroad telephone, tramway, etc., and work is in full blast at several places along the line. A temporary track of wooden rail will be laid from Taiia to the canyon, nine miles away, to be used as a tramway and operated by horses. At the canyon a power house is being erected, which will run a wire tramway to Sheep Camp, four miles, where another power house is going up, and the tramway continued on to Crater lake, four miles farther. From Crater to Lake Lindeman, a distance of ten miles, sleds will be used during the winter and every spring, and as the snow disappears in the spring, a grade will be built and horse-tramway used. Then, as soon as the high-water mark can be determined in the spring, a railroad grade will be built and thirty-pound rails laid and engines and cars put on from Taiia to the canyon. The whole line will be completed and in operation as tramway by January 1st from Taiia to Crater lake. The work on the grade and at the power house is progressing; cutting out the right of way, drilling holes in the rock for the towers for the tramway, stringing out the wire tramway, and erecting poles for the telephone. Four miles of wire are on the poles on the way to Sheep Camp and the upper power house.

One of the numerous "Alaska development" companies is having a dredger built in Seattle, Wash., to be used on the Yukon next summer. The sand and gravel do not come in contact with the wearing parts of the machinery. A suction pipe is run down into a sand or gravel bank to bedrock, and has crossbars at the inlet end to prevent any material over half its size from entering. The material is pumped up to the sluice boxes by two plunger pumps having cylinders of such size that the solid material does not touch them. The plungers work in a brass plate placed in the top of the cylinder and perforated with holes one thirty-second of an inch in diameter. Through these holes a jet of pure water continually flows, being fed from a separate pipe, and prevents the material from striking the plunger and wearing it. The material passes through the bottom of the pumps into a third cylinder placed between them, which maintains a regular flow into the sluice boxes. There will be two sets of sluice boxes, so that while dirt is being washed in one the other can be cleaned and the work can go on continually. Each set of sluice boxes will extend part way along one side, across the end and along the other side of the boat, running far enough over the stern to make the debris clear the wheel. The boat part consists of a catamaran scow 125 feet long and 32 feet beam, run by a stern wheel. A 72x14-inch engine will furnish motive power, and the dredger will be run by a 25 H. P. high-speed engine, geared up to gain eight times its nominal power. The pumps will have 26-inch plungers and a 12-inch suction pipe, rendered movable by knuckled joints. It is claimed that they will have a capacity of 2880 cubic yards in twenty-four hours.

UTAH.

Capt. De Lamar has paid $237,500 for a part of the Resolute No. 2 at Mercur.

A Washington, D. C., dispatch says the representatives of a New York syndicate and the agent of a St. Louis corporation now engaged in the gilsonite trade want to control the gilsonite business. On April 1, '98, the Uncompahgre Indian reservation in Utah will be opened to settlement, all except the mineral lands, which are reserved by the Government. These mineral lands embrace about 100,000 acres. G. H. Eldridge, the United States geological expert, says in his report that 23,000,000 tons of asphaltum can be mined in this Territory. Capt. Beck, agent for the Uncompahgre reservation, who is in Washington, explained that great difficulty is experienced in getting the gilsonite to market. The Denver & Rio Grande Railroad, which is the most accessible line, is 125 miles distant. The new syndicate that wins would, of course, construct a railroad from the mines to connect with the Denver & Rio Grande, thus greatly cheapening marketing of the product. The syndicate could afford to reduce the price without lessening its profits and at the same time create an increased demand. The net profit now realized on the gilsonite shipped from the vicinity of the Uncompahgre reservation is $10 a ton. The profit of a syndicate controlling the entire deposits and reducing the carrying charges might be twice as much per ton.

IDAHO.

At the Bingham Placer Company's property near Gibbonsville, arrangements for next season's washings have been perfected, and double the amount of gravel handled in 1897 is promised.

John Pilmer, who has been foreman at the Peacock mine, tells the Weiser *Signal* that the smelter, capacity 70 tons per day, will be in operation Jan. 1, '98. It is eleven miles from the Peacock. At the Peacock there is a face of 60 feet of ore in the open cut. It is his opinion that the entire face of 60 feet will average over 20 per cent copper. A lot of 480 tons of second-class ore left by those who formerly worked the mine was carefully sampled last summer and gave a return of 13.8 per cent. A tunnel has been run in 80 feet. The Helena mine is being worked under the superintendency of Jno. Anchor. It is developing a large amount of high-grade ore, carrying more than 50 per cent copper. The company is building a road to this property.

The Sonora Mining and Milling Company has incorporated at Wallace, capital stock $1,000,000; A. F. Gill, president.

A Boise dispatch says the sequel to what is believed there to be an attempt on the part of an English company to steal a valuable tract of placer ground was opened there this week when B. Wilson began suit against the Pioneer Gravel and Gold Mining Co., Limited, for the recovery of $130,000, with legal interest from April 2, 1894. The property involved is the old producing placer mines at Pioneerville, forty miles from Boise. An idea of their extent is given by the statement that water is supplied the immense tract from eighteen ditches, having an aggregate length of 100 miles. Wilson says he sold the mines to an English company for $150,000 in April, 1894,

receiving $20,000, and turned over the mines to the Englishmen, and that the latter have failed to pay anything additional, according to contract, and refusing to give up the ground, which Wilson claims they have looted. He also asks for a receiver.

The Mastodon and Milling Company is incorporated at Boise, capital stock $2,000,000; A. R. Sweet, secretary, Lewiston, Idaho. Its properties are in Elk City mining district, Idaho.

MONTANA.

The Garnet mill, three miles from Pony, is upon a natural millsite. Ore from the mine comes down 1000 feet on a gravity tram. The mill consists of twenty stamps, two 4-foot vanners and four 6-foot vanners. The capacity is three tons per stamp, or sixty tons of ore per day of twenty-four hours. In the mill and mine twenty-two men are employed. The result is the shipment of three cars of concentrates a month.

Inter-Mountain: Here are a few of the Montana mines which are recorded as dividend payers in the past or present, with the dividends paid to date:

Alice	$1,035,000
Bimetallic	1,630,000
Elkhorn	1,212,000
Parrot	1,656.122
Heela	2,175,000
Montana (limited)	2,890,637
Lexington	4,200,000
Boston and Montana	6,275,000
Granite Mountain	12,120,000
Anaconda	3,750,000
Hope	702,252
Iron Mountain	497,500
Montana Ore P. Co	6 0,000
Bald Butte	482,500
Florence	133,530
Western Mine Ent. Co.	12,000
Total	$39,410,541

J. Work has disposed of his Crevasse mine and mill to Clark & Westbrook of New York. The terms of the sale provide for the payment of $20,000; $6000 Dec. 4, $4000 March 15, 1898, and the balance on or before Aug. 1, 1898. The working lease provides for immediate possession of the mine and mills, consisting of thirty stamps.

COLORADO.

An Aspen dispatch says the owners of the Smuggler mine, which has been on fire, announce that the situation is much improved, inasmuch as they have succeeded in carrying lines of steam pipes to within a short distance of the fire, and hope in a few hours more to be playing upon it. Outsiders, however, take a different view of the situation. Already the gas has permeated the workings in the various mines on Smuggler mountain for two miles to the north of the Smuggler shaft, and 500 men have been driven out and two or three times that number will have to quit work if the fire is not quenched. The feeling here is gloomy, as it is believed a long shut down of the principal mines of the camp may occur.

At Aspen, the Argentum-Juniata Mining Company has decided not to renew the leases of that portion of the mine above the fourth level, and will in the future work the ground itself.

A Victor dispatch to the *Republican* says the rush with which ore is now coming out is blocking everything. Not only are the mills more than filled to the capacity of the bins, but the ore haulers are blocked and the railroads are, as usual, between fires trying to satisfy the three factors, with themselves in a crippled condition through shortage of rolling stock, and are urging the mine managers to ship in small lots and more frequently in order that the movement of cars may be expedited. The mills had educated the miners into shipping in large quantities in order to avoid the frequent clean-ups of the sampling machinery after small lots, and the railroads are coming in now and changing the order.

Business is booming all over the mountain system, and in a short time the Denver & Rio Grande will have to use 700 and 800 additional cars to handle the 1000 tons of daily production of iron ore the Pueblo rolling mills will require from the mines at Orient and Calumet. The output of Cripple Creek at the present time, with even a short haul of 40 miles, requires not less than 500 cars, and the demand will increase rather than diminish between now and the first of the year.

Idaho Springs *News*: Dewey Bros. have sold their sampling works in this city to the Kilton Chlorination Works of Breckenridge. The company have works at Boulder and Cripple Creek as well as at Breckenridge. Possession of the plant in this place is to be given between now and Dec. 1st. Oscar Lachmund will have charge under the new ownership.

NEW MEXICO.

An Albuquerque dispatch reports a mining deed filed in which P. A. Campbell of Brooklyn, N. Y., transfers mining property in township 12 north, range 6 east to the Industrial Gold Placer Company, the consideration being $20,000,000 worth of capital stock.

The *New Mexican* says the 80-ton smelter of the Mary Mining & Smelting Company, at Cerrillos, is nearing completion.

At Hillsboro, E. S. Flagg, manager New Mexico Dry Ore Concentrating Company, has a bond and lease on the Gold Star, Scandia and Unicorn mines. One thousand dollars, 10 per cent of the purchase price, was paid down, further payments extending over sufficient time to enable the lessees to thoroughly test the value of the property. The company will erect a mill at the mine with a capacity of fifty tons per day.

ARIZONA.

At Nacosari the Copper Queen Company are building a narrow gauge road four miles long to connect the mine and smelter site. A tunnel 5000 feet long will carry the road right under the mine, and the ore will go down to the cars in chutes.

The Gold Cliff Mining Company of Pearce W. H. Wren secretary, will proceed at once to erect rock crushers and rollers to prepare the ore to be treated by the cyanide process. The company has a large quantity of ore now upon the dumps ready for treatment, and will soon increase the capacity of the plant now in operation to meet the increased output of the mine.

At the Vulture mine twenty men are employed getting out ore. The 10-stamp mill is at work. Mr. McLeish is operating a cyanide plant and expects to complete the work in two months.

In accordance with orders from the operating company's offices at New York, the smelter at Crittenden, Pima county, has been closed down. The Hardshell mine, which supplied the reduction plant, has an ore body 15 feet in width, all of which went to the smelter. An assay from a depth of 300 feet gave returns of $105 in silver and $75 in lead.

The crude carbonate of soda from the head of the Gulf of California averages 75 per cent sodium carbonate, and may be used in its natural state for the saturation of crude boracic acid and for other purposes. It is considered to be a variety of the mineral known as "troua."

The Nogales *Oasis* is informed on good authority that the Garretson Smelting Company of Buffalo, N. Y., have arranged to erect a 250-ton smelter at Washington Camp.

At the Congress mine, at a depth of 1325 feet, a crosscut is being run to strike a body of ore known to exist.

MEXICO.

Wm. Guggenheim of Aguas Calientes was in Mexico City last month on business connected with his smelters. As to the present production of silver and gold in Mexico, he says: "We are receiving more gold at our smelters than ever before. A few years ago the entire output of gold in Mexico was only $3,000,000. Last year it was over $6,000,000—an increase of 100 per cent—but still a comparatively unimportant item in the world's supply of the yellow metal. The silver output has been greater this year than in '96."

MINE SUPERINTENDENT required who is thoroughly practical and experienced in Hydraulic, Drift and Quartz Mining and Milling. Apply, with references, to PACIFIC EXPLORATION CO., 29-30 Chronicle Building, San Francisco.

WANTED.—Thoroughly experienced mine clerk, stenographer, typewriter, time and stock keeper, desires a position of a similar kind; age 25; references. Can furnish own typewriter. Address J. C., office Mining and Scientific Press.

Situation by Thorough Millman.
Address W. H.,
295 VALENCIA STREET, SAN FRANCISCO.

FOR SALE, AT A BARGAIN.
A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.
First-Class Air Compressor (Steam driven) and Drill, New.
Also, 3-Ton Capacity Pulverizer.
A. L. FISH, 59-61 FIRST ST., San Francisco.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

BAKER & HAMILTON,

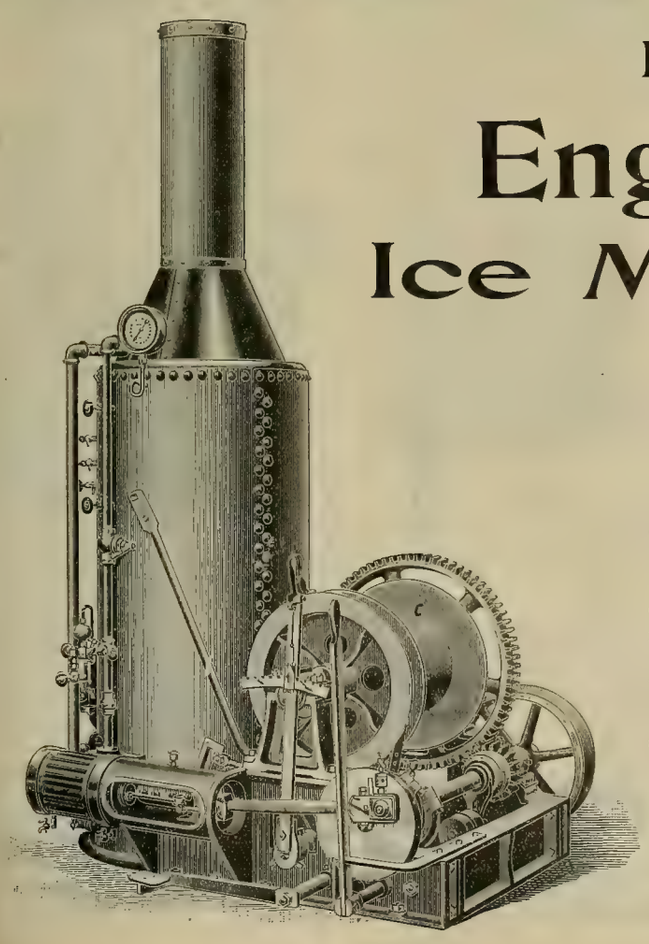
HIGH GRADE

Engines, Boilers,

Ice Machines,

Mining Tools,

ETC., ETC.



THIS CUT represents our Single Engine **PROSPECTORS' HOIST,** from 6 H. P. up, constructed with sectional iron frame, reversible link motion, improved brake, etc. Engine and Boiler can be disconnected and used for other purposes. Hoist and Engine can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also carry Double Engine Hoists, same type, with or without Boilers, from 12 H. P. up.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

MINE BELL SIGNALS.
Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals an Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

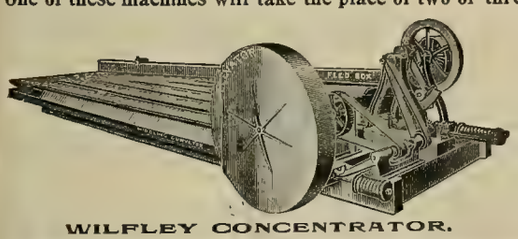
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

FINLAYSON PATENT WIRE ROPE TRAMWAY.

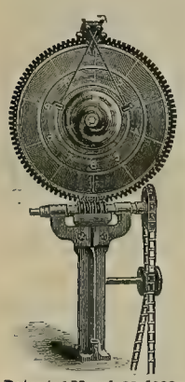
It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.

"KEEP YOUR EYE ON THE INDICATOR."



Patented March 28, 1893.

The Bolthoff Automatic Signal Alarm Indicator.

HUNDREDS NOW IN USE. UNIVERSALLY RECOMMENDED.

It is without question the most accurate indicator for hoisting engines ever constructed. Not only is there no lost motion, but it has the valuable feature of a device whereby automatically the approach to station, curves in the shaft, bad places, obstructions, or, in fact, if for any reason the engineer desires to be warned of the approach of the cage or bucket to any particular point in his shaft, either in hoisting or lowering, he can set it so that the signal bell will automatically sound its alarm.

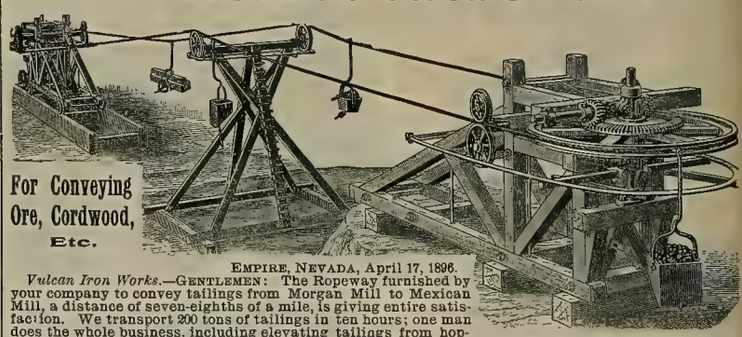
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 18, 1897.

General business in quiet compared with a month ago, but is considerable larger than in this month in 1896. It would seem as if the prices of nearly every commodity dealt in had been advanced higher than the situation warranted for lower quotations begin to be given out. Some say that this is due to a desire to reduce stocks before the new year at which time stock taking is the order. The outlook for 1898 is conceded by one and all to be of the most encouraging character so far as concerns business, and to meet the promised demand for goods merchants are arranging to carry more in stock of commodities specially adapted to mining sections. It looks as if there will be strong competition between steamship lines for the Alaska trade, for it is stated that Goodall, Perkins & Co. will increase the service by the addition of four or five steamers; the Alaska Commercial Co. will put on more vessels and the Philadelphia Company, at the head of which is one of the Cramps, will have five steamers in service. Each line will make San Francisco headquarters. These will insure the bulk of that far north's trade to this city, and with gold mines opening will cause a good demand for machinery from here.

The banks continue to report a plethora of funds with deposits steadily increasing. Notwithstanding the piling up of funds, the banks continue to scrutinize paper very closely. Backed by gilt-edge security there is no difficulty in getting all the money wanted. After Congress meets, and a general idea is obtained regarding monetary legislation, it is altogether likely that much easier times will rule and both capitalists and banks be more disposed to put out funds. The uncertainty regarding congressional legislation is having its effect, notwithstanding the impression that there will not be any unless the silver interest is favored more than it looks it will be at this writing. Eastern advices report generally easy markets, with no urgent demand from any particular source. There is a large accumulation of funds, which will be added to next month, so as to meet the January disbursements. These are expected to be exceptionally heavy.

New York Silver Prices.

NEW YORK, Nov. 18.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	26⅝	57⅛
Saturday	26⅝	57¾
Monday	26⅝	57⅞
Tuesday	27⅛	58¾
Wednesday	27	58⅜
Thursday	26⅝	57⅞

	Copper.	Lead.	Iron.	Tin.
Fri.	10 80 @11 00	3 80	10 00@12 25	13 70
Sat.	10 75 @10 90	3 75	10 00@12 25	13 75
Mon.	10 75 @10 90	3 72½	10 00@12 25	13 75
Tue.	10 75 @10 85	3 75	10 00@12 25	13 77½
Wed.	10 75 @10 85	3 82½	10 00@12 25	13 77½
Thur.	10 75 @10 85	3 85	10 00@12 25	13 77½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.82½
London Sight Bankers	$4.86½
Refined Silver, per oz., 1000 fine	57⅞
Mexican Dollars nominal	46½

SILVER.—The ups and downs of the market are somewhat mystifying. It can be accounted for only on the proposition that supplies are fairly well in hand, and any unexpected demand is met by an advance before outside sources of supply can come in. If published advices are correct, then it would seem as if every country is moving for a gold standard. The latest report put out is that the Straits contemplate adopting the gold standard, This is a large consumer of the white metal, although last year the demand fell away.

MEXICAN DOLLARS.—The market has been, and continues to be, quite active, to meet the China shipping demand for exchange.

COPPER.—The market is weak, with concessions given to effect sales. The markets at the East are lower and irregular. The offerings are in excess of the demand. The consumption abroad is less, although it is still quite free, but not enough to meet the output of the mines in this and other countries. It is expected that there will be no improvement until the turn of 1898.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12¼@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—The market is steady at quotations.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico. A Boston report says: "The quicksilver market is at present in a stronger position than it has been for years. Within the last ten days an advance of $1 per flask (76½ pounds) has been made to about $38 per flask. The stock of quicksilver in first hands is said to have undergone a great diminution in the last ten years, and to-day is not more than one-third what it was several years ago. An authority says the stock in first hands to-day does not exceed 4000 flasks. The Rothschilds, who control the Idria quicksilver mines of Austria, are said to control the market price. The domestic consumption is so steadily increasing that already the question of importing quicksilver is being discussed." The local properties Napa, Ætna and New Idria are in good condition. The Napa has already declared an extra dividend, with extras on the other properties by no means future impossibilities.

LEAD.—In our market there is nothing new to report. At the East the markets weakened, but towards the close they are strengthening. The outlook is favorable for steady to strong markets.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @ 5 00
Sheet	6 30 @ 6 80
Pipe	5 60 @ 6 10

TIN.—The market is quiet, with concessions obtainable for both spot and to arrive. Sales for future delivery have been made, but on private terms.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C, coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is firm.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

IRON.—There is nothing new to report in our market. As usual at this season of the year, the consumption is light; but the outlook for 1898 is of the most encouraging character.

NAILS.—The market is weak at a decline.

We quote the following basis: 20d to 60d inclusive, wire $2.35, cut $2.25.

COAL.—The market is steady at combine quotations. An attempt is to be made to dissolve the combination through the courts. The supply of foreign promises to fall away, owing to lessened cargoes on the way. This makes some grades firmer.

Receipts of coal for the week ending with Tuesday were as follows in tons: Departure Bay, 4372; Puget Sound, 7500; Comox, 2500; Swansea, 4639; Coquille River, 115. Total, 19,125.

COKE.—The market is steady.

The market is quoted as follows:

Gas Companies'	— — — —
English, to load	— — @ — —
" spot, in bulk	11 00 @ — —
" in sacks	12 00 @ — —
Cumberland	10 00 @ — —

PLATINUM.—The market is firm.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is fairly firm.

The market is quoted as follows:

Refined, in carload lots, in barrels	5½
Refined, in carload lots in sacks	5½
Powdered, in car lots	5½
Concentrated, "	5

Chemicals.

The market is quiet in about every line. There seems to be no disposition to strengthen prices, but rather in some articles there is more or less irregularity. The East reports quiet markets, with some shading.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1½c per lb for 66°.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—There is a good demand at unchanged quotations.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is easy for spot and shipment.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Nov. 18, 1897.

The market has been slow, with the manipulators for the moneyed pool successful in forcing lower prices for the more desirable shares. The slow, steady decline, with the market made to look extremely sick as if going to pieces, enabled quite a line of shares to be secured. While prices may go lower yet, the writer's experience warrants the assertion that a good-sized deal is in contemplation. This opinion is strengthened by the persistent efforts of tools and others in creating the impression that John W. Mackay, J. L. Flood, D. O. Mills and Col. Hayward are paying no attention to the market, and would not make thousands of dollars if given the opportunity, as if they would give their business away. All successful moves, either up or down, have been made by blinding the public to the true situation and what moneyed men are doing. There is important work going on in several mines, but at present it is largely for the purpose of getting them into better condition for working when the time is ripe for a good-sized move. The general financial and business interests of the country are healthy and on a good footing for better times ahead There never was more money in the country available for speculative purposes and legitimate business transactions, and it is well known that the public on this coast and at the East are ripe for gambles, and with attention centered to this coast owing to the Alaskan gold discoveries, a boom in Comstock mining shares can be successfully made. The only drawback at present is the meeting of Congress, when the monetary system of the country will come to the front for discussion and, if possible, revision. While this is under way, it is not at all likely much of, if any, bull movement will be inaugurated, although there are some who look for an up-move before the holidays, or else soon after. The past week Justice showed considerable activity at higher prices, owing to reports of an improvement in the mines. So far as we can learn the prospects are quite encouraging, but even if a good-sized body of ore is uncovered, who will get the bullion?

The news from the Comstock mines given out seems to be largely for the purpose of attracting attention to mines in which there is very little hope entertained of finding good sized bodies of ore. In doing his outsiders not informed on the true situation and surface dealers let go shares of mines marked for future dealing. In Utah they are still running west, but nothing new is reported from it. They continue drifting north in Andes on the 175-foot level. Low-grade ore and quartz are found. On the Layton tunnel of Sierra Nevada they hoist a few tons of ore each week while prosecuting work. They have milled over 150 tons. They are pushing the Riley tunnel ahead and at the same time doing some repair work in the north lateral drift on the 900-foot level. In Union they have finished some repair work and are again doing dead work on the 900-foot level. They continue to block out work in Mexican on the 1000-foot level. Last letter from Ophir reports the west crossdrift on the 1000-foot level was in the west country. If they do not get bewildered and turn in the wrong direction they will strike ore further west. They are still blocking out on the Central tunnel level. In Con. Virginia work is continued on the 1550-foot, 1650-foot and 1750-foot levels. From the nature of the work it ought to cause surprise if an improvement is announced before the end of next month. In Gould & Curry they are still extracting and hoisting low-grade ore. That milled shows a large percentage of silver. It is doubtful if it will pay unless the charges are low. From Savage nothing new comes to hand. No work is reported in Hale & Norcross. In Chollar they are still repairing below the 1100-foot level in the incline shaft. Private advices are rather encouraging from the work in the south drift as it goes towards Bullion. Nothing important is reported from the work in other parts of the mine. In Alpha they are still going northeast on the 500-foot level. Some low-grade ore was run into. They are still going west in Con. Imperial. The flow of water is still quite strong. Work is suspended in Confidence. Private advices from Yellow Jacket are quite encouraging. If the shares were better concentrated there would be a good move in them on the showing in the mine towards Kentuck. Active work is being done in both Crown Point and Belcher with every prospect of finding ore before the end of the year. Nothing new is reported from Overman or Seg. Belcher. The official letter from Justice reports an 18-inch vein of ore going about $105 to the ton. If this should widen it will create some buying of the shares.

From the Brunswick lode there is absolutely nothing new to report, although the work in Occidental, Potosi and joint work in Gould & Curry and Best & Belcher is quite encouraging. The Occidental management is quite hopeful of developing a paying mine, but it will take time and money to do it, even if the ore is there. The official letter says they will have to go 100 feet on the 750-foot before reaching the ore found above. They are pushing south in Potosi on the 500-foot level. In Chollar active work is being done on the levels and in the same directions heretofore reported. The returns from ore milled gave $4579 in gold and 3384 ounces of silver. The work in Savage and the joint work in Gould & Curry, Best & Belcher and Con. Virginia is practically the same as reported last week.

The following illustrates the changes of the week:

Mines.	Nov. 11.	Nov. 18.

Marquette, Mich., U. S. A.
Operator and Dealer in
Mines, Mining Properties and Mineral Lands,
Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from D. D. Allard et als., in the Cambridge Mine near Plymouth, Amador Co., to deposit tailings on a flat; from W. C. Corbett and A. W. Carmichael, in the McMartin Mine near Onion Valley, Plumas Co., to deposit tailings behind the dam of the Good Hope Mining Co in Onion Valley Creek; from Geo. W. Mohler, in the Mohler Mine near Pike City, Sierra Co., to deposit tailings in a ravine below the mine; from Manuel Silva and Joseph Enos, in the Manuel Silva Mining Company's Mine near Cherokee, Butte Co., to deposit tailings in Spring Valley Creek; from J. H. Kneeland, Jr., in the Colfax Gravel and Pierce claims, near Colfax, Placer Co., to deposit tailings in Long Ravine; from L. L. Sherrod et als., in the American Gravel Mining Company's Mine near Centerville, Butte Co., to deposit tailings in ravines below the mine; and from the Kate Hayes Mining Co., in the Manzanita Mine near Sweetland, Nevada Co., to deposit tailings in the impounding basin of the old Manzanita Mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 29, 1897, at 1:30 P. M.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 2) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block No. 309 Montgomery stre t, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 29, Nevada block No. 309 Montgomery street, San Francisco, California.

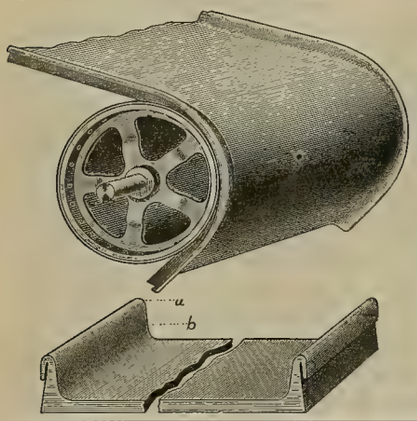
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

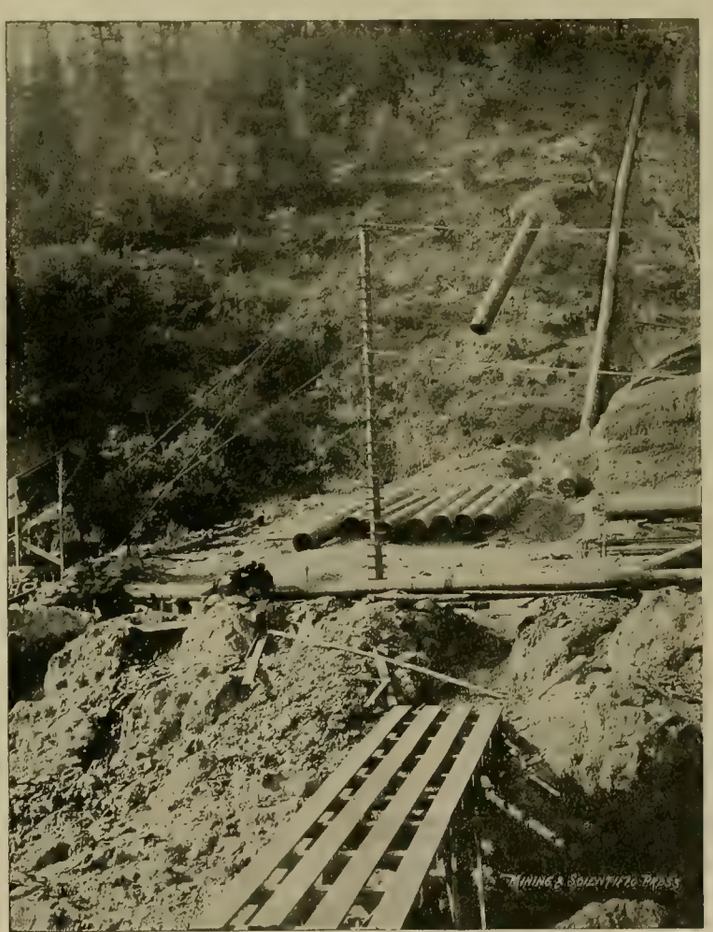
No. 1951.—VOLUME LXXV. Number 22. SAN FRANCISCO, SATURDAY, NOVEMBER 27, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Golden Jubilee.

It was suggested about a year ago in these columns that the fiftieth anniversary of the discovery of gold in California would be a fitting time for a golden jubilee, attracting attention to California and serving as a good advertisement for this State. The sentimental part of it was taken up the California Society of Pioneers; the more practical part by the California State Miners' Association. It has been decided that there shall be a celebration of the fiftieth anniversary of the discovery of gold in this State on January 24, 1898, under the direction of the California Society of Pioneers, and that in an active way these venerable men shall have the co-operation of the California State Miners' Association. The programme is to have the celebration take the form of a parade in San Francisco and literary exercises during the evening. The State militia will be called out to take part in the parade, and the Governor of the State will declare the day a legal holiday. It is a golden jubilee in fact as well as in name. The only emulation that need be between the associations and organizations that propose to carry on the celebration should be to see which can most greatly aid in making it a success. In this regard the MINING AND SCIENTIFIC PRESS would simply suggest that the celebration should not be used merely as the commemoration of a historical event of considerable importance, but possessing no active interest in connection with the present. This might be well enough for those whose names are forever stricken from the muster roll of duty and who are content to slip down the back stairs of time to oblivion; but it is in order to make this semi-centennial a celebration of one of the greatest events in modern history—the means of attracting the attention of everyone everywhere to the fact that, where gold mining in this nation first received its great impetus, there has been throughout the years steady progress in scientific methods, in intelligent handling of ores and in economical management; so that to-day, in place of being the worn-out "has been" that is so often intimated, California stands in the van. This occasion should be taken hold of with the one idea sole in view, namely, to give the widest publicity to the truth regarding the present condition of mining in California; to proclaim as thoroughly and widely as the facts justify, that California is the leading gold-producing State in the Union; that the $1,315,000,000 worth of gold taken from its soil is but an index of what remains to be secured; and that were capital invested in mines here as largely as elsewhere, there would be a continual sound of dropping stamps for a distance of 700 miles; that in California, of all places on earth, man can work 365 days in the year; that California has solved the problem of cheap creation of power; that it is fast absolving itself from the thralldom of coal; that in no place on earth, at any time of which there is any record, has gold been produced as abundantly and under as favorable and economical conditions as in this commonwealth. These things can be demonstrated grandly and truthfully by those in charge of the semi-centennial celebration of the discovery of gold by James Marshall, at Coloma, El Dorado Co., January 24, 1848.

Large Hydraulic Pipe in Trinity Co., Cal.

Considerable interest has been manifested in the enterprise of the Cie Fse des Placers Hydrauliques de Junction City, Trinity county, Cal., of which Mr. E. Saladin is manager. It is one of the largest schemes of that kind ever inaugurated in this State—that is, taking into consideration the size of the pipe used and its length. It is of course well known to hydraulic miners that the ditch is the cheapest way of getting water to the grounds to be worked; but where there is much rock to be taken out, or where the ground is broken and porous, where water must be conveyed across canyons or around mountain sides, or where water is so scarce that the operation of absorption must be reduced to the minimum, flumes are used, and some of the finest mining engineering work in this State has been in building flumes. Where even flumes are inadmissible, or water is required to be conveyed to points far above or below the ditch or flume level, use must be made of iron pipes, if sufficient head cannot be secured to force the water over the obstruction. Where obstacles are to be overcome which preclude resource to the flume, iron pipe in the form of an inverted syphon is employed.



LAYING 36-IN. IRON PIPE BY TROLLEY CABLE, TRINITY CO., CAL.

Many years ago the writer noted the construction of a pipe of this kind, built by the Spring Valley Canal Co. in Butte county, where in pipes of 24 and 30 inches the water was carried by their ditch across a deep canyon. They let down a 30-inch line pipe, extending from one side of the gorge to the other, a distance of 1400 feet, the point where the water ended being about 100 feet above the bottom of the canyon and 150 feet above the point where it escaped. The water where it entered the pipe had a head of 150 feet, and yet at this end of the pipe it never attained a head of 50 feet, which would seem to denote that a smaller pipe than that laid down would have been sufficient. This pipe, which under the pressure mentioned, discharged 50 cubic feet per second, served its purpose; for at many points the pressure exerted ranged from 74 to 384 pounds per square inch. In the enterprise under discussion—that of the French company which is intelligently expending a large sum of money in Trinity county, in the northern part of this State—the improved appliances of later years have been utilized, it having been deemed necessary to combine the three methods of carrying water, namely, ditch, flume and piping. The work was taken up about one year ago and is now being brought to a successful conclusion. The total length of the ditch is eleven miles. A semi-hexagonal flume on the Canyon Creek line has the bottom 4 feet, top 3 feet, grade 8 feet to the mile, and length 2100 feet. The length of all the flumes in the ditch is one and one-half miles. The syphon is 5700 feet long across the Trinity River valley, a canyon passing over a divide 280 feet deep, drop of water 24 feet. The first portion of the pipe is 18 inches in diameter; then 2200 feet of 30-inch pipe and 3400 feet of 36-inch pipe. The 30-inch pipe is made of No. 10 iron in 48-foot sections, each section weighing 340 pounds. The work of laying the pipe called out an exhibition of engineering skill. A hoisting machine, ordinarily used for removing boulders by means of a cable, was called into requisition and used to lay the big pipe on each side of the syphon. It consists of a Pelton wheel with a 3-foot drive; a friction wheel, on each side of which is applied, by means of a lever, an iron driving drum. One drum used was made of ½-inch cast steel flexible rope; the other drum, used to drive the big line, ⅝-inch.

The illustration shows the method of laying the pipe by the trolley cable, operated by water power; size of the pipe, 36 inches. The heaviest iron in the construction was No. 6; its total weight, 280 tons. The pipe was furnished by Schaw, Ingram, Batcher & Co. of Sacramento. The engineering was by Mr. E. Saladin. The pipe was delivered at Redding and hauled in sections to where it was to be used, where it was put in place (as briefly described) and riveted, so as to make the entire 5700 feet one continuous piece. Mr. Saladin writes: "All the work of laying the pipe has been done entirely by the company, furnishing all the engineering and calculations, to the last anchor bolt, receiving the pipe in only 24-foot sections, delivered at Junction City by the makers." This is one of the largest enterprises of the kind in the history of hydraulic mining in this State.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 509.

English Purchasers of California Mines.

A good many letters come to this office from present or prospective British investors in California mines, vigorously criticising local methods and usually objecting to "the California manner of procedure." Several of them have been given place herein on the principle under which this paper is conducted, namely, an open court or public forum for the discussion of questions pertaining to practical mining and scientific matters; and the question of the purchase of a mine is just as much a matter of scientific mining as anything else in connection with the industry.

Our English correspondents suggest a wide field of discussion. In all these matters so very much depends upon the point of view. The letters in the issues of October 2nd and November 20th are fairly representative of a host of similar communications constantly received in this office and, doubtless, received by others who have something to say or do with mining matters in California, their entire tenor being summed up in the expression, more or less courteously conveyed, that we do not know much here about how to do these things and that, out of the plentitude of their knowledge, our English friends are willing to vouchsafe us some practical information thereon.

After fifty years of successful gold mining in this State; after originating, developing and perfecting the best methods of mining in nearly every department; after successfully attempting, during that time, to furnish the world's demand for the best men to manage large enterprises; and after successful handling of the biggest and best mines on this continent, both as to their discovery, development, transfer and actual working, it is not beyond the bounds of belief that California has some just claim to knowing a little about these matters.

One view that is sometimes presented to the editor of this paper, from apparently competent English sources, is that we are not sufficiently appreciative here of the possibilities of English investment and that we do not value that source of favor sufficiently high; that ordinary business requirements or customary practice should be ignored; and that California owners of mines should hasten to disregard any suggestion other than to comply with every demand of possible British investors.

It may be that our English friends are disquieted at the presumption of Californians in exhibiting some slight hesitation in accepting a proposition to make over to them valuable properties without sufficient financial inducement. But it is respectfully submitted that, whenever an Englishman has a good thing, he is ordinarily loth to surrender its control without due financial recompense. The instances that our correspondents cite ordinarily seem fair to both prospective purchaser and buyer. Were the positions reversed and were American capital seeking to invest in British mines, it is possible that the point of view of the British mine owner might be changed somewhat.

An objection often voiced is that California mine properties should not be bought in London, because of disastrous results of management of English properties in this State—properties, too, that had, anterior to their sale to English capitalists, paid regular dividends. Some few prominent instances of this kind are always cited; but the hundreds of instances where American properties have shown steady value are usually ignored.

In relation to the oft-repeated claim that English investments in California mines are unsatisfactory to the investor, it can be said that the English investors have only themselves to blame. In the first place, it is customary, when a mine is purchased by an English company, to ignore any suggestion, advice, experience, friendly counsel or business requirements other than that emanating from the London board of directors. As a general thing, though not always, the superintendent or manager, sometimes a younger son of a younger brother, is an Englishman "fresh" from London; the foreman is at first an Englishman; everybody that possibly can be given employment in the mine is English. A most ridiculous prospectus is issued; some duke, or earl, or lord is put in as a figurehead in ostensible control, and the whole thing is managed in the most extravagant way in London, entirely from the London standpoint. The glittering and meretricious prospectus—which reads more like a romance than a statement of facts, placing an immense capitalization on the mine—is circulated where it will do the most good—or harm; and little tricks and practices that are invidiously implied to the "Yankee" are practiced to an extent that no "Yankee" ever dreamed of, to induce the well-to-do middle class of Englishmen to invest.

When, after a brief term of mismanagement, no dividends are forthcoming, the odium of the failure is turned upon California. The directors frown, and imply, or plainly state, that there is a swindle or deception in the transaction, forgetting the fact that the property was accepted by the English syndicate on the report of its own engineer. These engineers rely solely on their own judgment, acting in ignorance or defiance of the opinion of California experts—who, it is believed, know more about California mines than any British mining engineer can possibly know, except by the same severe course of practical local study that gave the California engineer his knowledge in these matters. Then, again, the English mining investor seems imbued with the idea that nothing but a "going" mine is worthy of his consideration. He wants a mine that is developed, blocked out, paying steady dividends, with the prospects of continuance in this regard, and then at his own price. These mines are very rare. Ordinarily, where such a mine exists in California, or anywhere else, its present owners are fully cognizant of its value and do not care to sell it, except on the same terms as any other established business could be transferred, namely, with regard to its actual value as a dividend proposition under proper, intelligent management.

The writer has in view a recent proffer that came under his personal observation, where the owners of a California gold mine, being importuned repeatedly to place some value on their property—which has been paying dividends for years, and which, if named herein, would be recognized at once—finally acceded, with, substantially, this proposition: That they would make certain statements in regard to the mine, its present condition, the dividends that it had paid and was now paying, the amount of ore in sight, and the probability of a continuance of such dividends; that they would take $1,250,000 for their property; that the British investors could send their own experts to examine the mine and their own expert accountants to have full investigation of all their books and accounts; that as a preliminary a deposit of $10,000 should be made in escrow. If upon investigation by their accountants the proposed English purchasers should find that the statements made by the American owners were not borne out by the facts, the $10,000 should be returned. If found to be in accordance with statements of the owners, the $10,000 should be retained to apply on the purchase price. That upon the further payment of $50,000 the English mining experts appointed by the proposed purchasers should have the privilege of examining the entire workings of the property. If their report was favorable, the $50,000 was to be applied to the purchase price; if unfavorable, the $50,000, together with the $10,000, was to be returned. If upon favorable reports from the English expert accountants and expert mining engineers the English syndicate proposed to go on further, the remaining $1,190,000 was to be paid in three installments, divided conveniently as to time and amount.

From the American standpoint this seems fair. The proposition upon reaching England was considered outrageous and many virtuous expressions of shocked sensibilities were vouchsafed. Whether the proposition was fair or unfair, can readily be left without comment to the good sense of any mining man in any part of the world. It need but be said that the owners of this claim had never offered the mine for sale, and justly looked upon their property the same as the owners of a piece of profitable ground in the city of London would, viz: as something to be sold for what it was worth, viewed in that light.

Another case comes to mind of a gravel proposition in this State, where, after solicitation, the owners said to the representative of the English company: "You can pay us $10,000 down and take the property as it is; or you can have a working bond on it for six months, and if, at the end of that time, you consider that you want the property, you can pay us $20,000 for it."

This also looks fair, from our standpoint; but it was rejected by the London people with some discourteous expressions as to Yankee tricks; though where the trick is in either of these transactions, is not apparent.

The above is not proffered otherwise than in the most courteous manner. It is not desired to be ill-natured nor unjust; but the facts are believed to justify these statements. Californians are just like any other people—if they have a good thing and anybody wants it, whether he lives in California or Tasmania, he must pay a fair price for it. Nor is it to be assumed, as some of our critics volubly assure us, that we are all standing round here in humble expectancy of having our British friends vouchsafe occasional suggestions in our direction, and when they can get anything on their own terms, take it.

San Francisco, and other cities of California, are investing as of old. San Francisco capital to the amount of $4,000,000 has gone into one California county within the last two years. Whether British residents invest in California or decline so to do is not a matter of immediate concern here. Nobody, so far as the writer is aware, is worrying over the situation; there is no clamoring for recognition, nor disappointment when such recognition is not forthcoming. The facts are patent to the world; California has led in all these years in its gold production, and the gold taken from its soil is but an index of that which remains. These are not mere assertions; it is but necessary to point to the facts.

A little less brag and bluster, a little less lofty assumption of superiority in business requirements, experience and knowledge, a little more recognition of the facts, would, on the part of our British friends, tend to a better understanding of the situation, so far as the purchase or sale of gold mines in California is concerned.

To English investors who want to work the mine and not the street, who wish a fair opportunity for investment in mines with the maximum of probable profit and the minimum of the gambling element; who are in the frame of mind that permits them to have more faith in the unprejudiced reports of competent experts than the glittering statements of London mining prospectuses; the writer may say, without detriment to other rich regions, that no section of gold producing territory offers more favorable opportunity for profit than California.

The $1,315,000,000 produced in gold in this State is but an index of that which remains to be secured by intelligent, up-to-date scientific, economical methods. America is a favorite field, and, under ordinary business conditions, a profitable one for the

English investor. Englishmen know and concede this in nearly all departments of business life; prominent among them is the business of mining, considered purely as a legitimate business. There is probably no region on earth where gold mining has long been carried on with greater success; and to those who have been its chief movers there has been almost total absence of stock jobbing and stock manipulation in connection with California. There are probably few or no "fake" companies in California, designed primarily to mine the pockets of the stock holders. Instances of this kind are very rare and are at once locally noted and exposed. The London journals are constantly full of warning to investors to beware of gambles in which the actual merits of the properties do not count as factors. Such gambles are manipulated by big financial houses, who do with the investors what they will.

It may be said in this regard that where English money is invested in California gold mines, while English purchasers or buyers usually evince a preference for what is termed a "going concern," they often could probably do better for the money by buying what we here term a "prospect." California's interpretation of the word "prospect" has a wider latitude than that given it by English residents, and with us means more than the dictionary definition of the word might imply. A "prospect" in California is a mining property of at least sufficient value to justify considerable time and money spent in exploiting, exploring, securing sure title, and developing it; and while a prospector is by nature a little disposed to be too sanguine, such disposition is usually toned down by experience. A practical prospector is very unlikely to spend a great deal of money on a valueless piece of ground. True, he may want too much for his claim; but under the circumstances he is unable to misrepresent in such a way that his misrepresentations cannot be found out.

"Going" concerns are usually profitable and the owner is rarely willing to sell unless he gets a good price; and a mistake made in buying a going concern is usually more costly than an error in the purchase of a prospect.

At present in London mining journals there seems to be a concerted effort to publish statements derogatory to California mines and eulogistic of mining properties in other districts. Meanwhile, California goes steadily ahead leading in gold production. There are booms and boomerangs elsewhere and a good many deluded investors lose money.

Of course, it is usually understood that trade follows the flag, and that an Englishman prefers to invest in mining property in a country through which is heard the daily drum-beat of British control, the world round; which shows evidence of patriotism on his part, whatever may be said of his business judgment. It is also sometimes asked: "Why do not your local capitalists invest? You are on the spot and have the money and pretend to know all about it. Why do you allow these things to get away from you?" The same question could with equal propriety be asked of British Columbia, or Australia, or Rhodesia, or Guiana, or anywhere else where gold mining is carried on and where English capital is invested. It is probably unnecessary to say that there is a limit to capital—even to the capital of Californians, who, as a general thing, always invest to the extent of their means.

There are hundreds of claims all over this State that show as much promise as once did the largest and best mines that we have. They were all mere prospects originally, and would so have remained to this day had not their owners secured the money for their development. The best properties to-day were, with rarely an exception, sold for the proverbial song. They are now paying handsome dividends to private owners, of which little is ever heard. It is not held that all such concerns or investments are successes; of course there are failures; but business statistics have shown that there is a very large percentage of failures in mercantile life; yet men will persist in buying and selling goods. The same statistics show a far less percentage of failures and loss in the mining world than any other department of business life.

It may be said in addition that while there are thousands of good prospects in this State, the owners are often too poor or too lazy to work and develop them. This is the opportunity of the capitalist, local or foreign, and no field furnishes a more inviting one for investment in that regard than this. Whatever the claims of other districts, whatever the prophecies, one fact stands undisputed: that no other State or like subdivision has ever yet been able to consecutively equal the annual gold output of California.

There are fifty-seven counties in this State—some of them many thousand square miles in area—and in thirty-seven of these counties abundant gold is produced; whether mountain, valley, or coast, all yield it in some form; not only in the quartz, but in hydraulic washings, dry creeks, wet and dry placers, sands of the sea beach, the gravel beds of ancient rivers underlying volcanic lava of æons ago—everywhere throughout California's ample domain is found the metal that all are seeking, and which dominates the business world to-day.

Other States have the advantage of California in understanding how to advertise their mineral resources. In this State the policy has always been to keep quiet about the producing mines and give out as little as possible, declining to furnish statistics, underrating the yield and in every way doing the reverse of what is done in many other regions of less substantial value. The greatest gold mines in the United States are in California, and yet they are scarcely heard of even in this State, still less in other States, least of all in foreign countries. The reason for this is due largely to the fact that our gold mines are not stock operations. Gold mining stocks, with very few exceptions, are not sold in the market, and the stock exchanges know nothing of them. These gold mines are represented by private concerns, who keep their business strictly to themselves. They do not herald rich strikes; they do not publish any voluminous reports; but their richness is evident from the many enterprises, public and private, that their owners promote—in the magnificence of their private homes and their princely manner of living.

Few States are more favorably related in law to the business of gold mining. California has been gold mining so long that its details have been thoroughly mastered. In the neighboring States of Utah and Nevada the net product of the mines is taxed; no such tax is imposed in California. In this regard much, too, has been said regarding alien ownership; but no Englishmen or other foreign investors have ever found any serious difficulty in this regard, this matter having been thoroughly answered and explained in previous issues.

Investors from England or elsewhere cannot find the mines they want in a day or a week, and they cannot buy them for a song nor can they ordinarily induce the owners of paying mines to part with them except for value received. But those who seriously propose investing can probably do better to-day in California than they can in any other part of the world.

A Commendable Idea.

In connection with the commemoration of the fiftieth anniversary of the discovery of gold in this State, has been broached the project of holding a golden jubilee fair at the Mechanics' Institute in this city. The idea is a most commendable one, and deserves to be carried out on the lines indicated. While the fiftieth anniversary of the discovery of gold in this State is of itself a notable event, existing business conditions justify, in connection with it, such a fair as that proposed to be held. The several commercial bodies of the city have already appointed a joint committee, and with proper concerted action and prompt effort, the project can be made a success. The Golden Jubilee Fair, under the auspices of the California State Miners' Association, the San Francisco County Miners' Association, the Manufacturers' and Producers' Association, the State Board of Trade and the Alaskan Trade Committee, can be made a powerful factor in demonstrating California's advantageous trade position, in showing what has been done and can be done in mining in California, and in exhibiting to thousands of visitors interested in mining here and elsewhere the latest, best, most scientific and most economical methods of mining gold.

Especially is this the case in reference to what is universally understood to be a great movement next season toward the newly discovered placers of the Yukon region. That there will be a tremendous outpouring in the early months of '98 to the extreme northwest is evident. The Atlantic slope and central Mississippi valley will, it is thought, send at least 100,000 men next spring, the vast majority of whom know nothing whatever about mining and who will want to learn. No better object lesson for them and no better business advertisement for California could be devised than the proposed fair. The good business policy of the undertaking is so manifest as to need no elaboration. Nothing could more readily induce a large percentage of the coming gold seekers to visit this city than such an exhibition.

In this regard, it is to be said that one immediate requisite to insure the greatest success is advertising. The project should at once receive the widest advertising all over the country.

The revival of gold mining, which began in '92, has been great. The fact that gold is the only product that has not depreciated in value, that is sure of a market at a set rate, makes it the most sought for of any product of the world; and it remains now for San Francisco to take the tide at its full. The time is so short that it will require vigorous and concerted effort on the part of every one connected with or favoring the enterprise to make it the success that it should be; and stress is laid herein on the one point hitherto not noted in connection with the matter, namely, immediate and widespread announcement throughout the region east of the Rocky mountains of the fact that such a fair will be held and every honorable inducement made to secure a large number of visitors.

Speaking only of recent years, the mineral products of this State for 1895 had a market commercial value of $22,844,000; for 1896 a value of $24,891,000; it is believed that the value of mineral products in this commonwealth for the current year will approximate $27,000,000. Of such great amount a large percentage is disbursed in this State and in this city for machinery and supplies. Estimates of San Francisco's annual sales of mining machinery and supplies to the miners approximate $6,000,000, this showing what business reasons there are for advocating the mining industry.

There is a too prevalent opinion in a great many quarters that California was "played out" years ago. It was with amusement, not untinged with regret, that the writer, at a dinner given in this city some time ago in honor of the visit of one of the best informed men in the world, Chauncey Depew of New York, heard that usually well-informed gentleman, in the course of his remarks, say in his good-natured, patronizing way: "True, you of California have worked out all your gold, but then you can raise nuts and oranges, and there is money in fruit." The genial Mr. Depew believed what he said, and his belief is shared in by a great many. When such unusually well-posted men as he think so, what must be said of the density of ordinary ignorance regarding this State's gold.

The very fact that gold was discovered in this State nearly fifty years ago, and that men now middle-aged have always known of California as being the golden State, argues in the minds of many that such golden pre-eminence cannot possibly continue anywhere, and that California must have been pretty well mined out long ago.

If the proposed celebration on the 24th of next January and the projected midwinter golden jubilee fair can tend to dispel in any degree such mistaken ideas in the minds of many people, it will be a business success; and in this lies the largest measure of its value.

MR. H. R. CASSELL, manager of the Bromine Gold Extraction Co., claims that his company has now succeeded in treating ore with a loss of only about half an ounce of bromine to the ton of ore treated, and that the ability to recover the bromine at a small loss and a small nominal cost overcomes the chief objection to its use. He says that the bromine is now converted into a dry salt, and shipped in that form to any part of the world: and that by a series of experiments, the company has succeeded in treating ores containing both gold and copper with success, at a low cost and a saving of both metals.

Notes on By-Products in the Gold Mining Industry.*
